Introduction to SAS Business Rules Manager

Chapter 1

Overview of SAS Business Rules Manager .................. 3
Chapter 1
Overview of SAS Business Rules Manager

Enterprise Decision Management Systems

Enterprise decision management systems can transform the way businesses make decisions. They enable businesses to use the information they already have to make better decisions—decisions that are based on predictive analytics rather than on past history. Decision management systems automate the process of making decisions, particularly day-to-day operational decisions. They improve the speed, efficiency, and accuracy of routine business processes, in part by reducing the need for human intervention. By automating decisions, organizations in every industry can improve interactions with customers, partners, suppliers, and employees. In addition, organizations that are highly regulated, such as financial services, health care, and insurance, can more easily achieve compliance as a result of repeatable, traceable decisions.

About SAS Business Rules Manager

Business rules capture the logic of business decisions and are one of the core components of decision management systems. Business rules make the decision-making process transparent and adaptable, allowing organizations to respond quickly to new information about customers and markets. They allow organizations to identify and deal with fraud, avoid unnecessary risk, and find opportunities hidden in customer data.

You can use SAS Business Rules Manager to create a database of business rules, connect those rules together into rules flows, and publish the rule flows for use by other applications. SAS Business Rules Manager provides the following capabilities:

data management
You can manage your list of data tables from within the application. You can create new Base SAS libraries, add and remove tables, view table data and metadata, create
and delete table summaries, and associate attachments and comments with tables. The application uses these data tables whenever it needs to access data, such as for rule discovery and rule flow testing.

vocabulary management
A business vocabulary defines entities and terms. Terms are the building blocks that you use to construct business rules. SAS Business Rules Manager enables you to easily create and edit entities and terms. For individual terms, you can create a list of allowable values, which makes creating rules even easier.

business rule authoring
A business rule specifies conditions to be evaluated and action to be taken if those conditions are satisfied. For example, you can create a rule that determines whether a customer has a mortgage. That same rule can then add the outstanding balance of the mortgage to a running total of the customer’s debt. With SAS Business Rules Manager, you define the conditions and actions for each rule. You can use the Equation Editor to create the expressions for the rule.

The rule authoring features of SAS Business Rules Manager make creating rules easier and more accurate. For example, the list of allowable values for a term help avoid incorrect rules. The lists of allowable values can be updated as needed, and the lists do not prevent you from providing new values manually.

rule set management
A rule set is a logical collection of rules. A single rule set can have many rules. For example, you might have a rule set that determines a customer’s asset balance and another rule set that determines a customer’s debt level. SAS Business Rules Manager displays rules sets in decision tables. Each row of the decision table defines the conditions and actions for one rule. By using SAS Business Rules Manager, you can easily create new rule sets, reorder the rules in a rule set, add new rules to existing rule sets, and more.

You can also manage rule sets and rule flows. When a rule set or rule flow is published, the versioning features of SAS Business Rules Manager create a static version of the rule set or rule flow. This static version helps you to enforce integrity and governance over the rule sets and rule flows that are put into production.

rule flow authoring and publishing
A rule flow is a logical collection of rule sets. A rule flow defines a set of rule sets and the order in which they will be executed. A single rule flow frequently corresponds to a single decision. For example, a rule flow can initially execute the rule set that determines a customer’s asset balance. Next, the rule set that determine a customer’s debt level is executed. Finally, the rule set that assign’s a customer’s loan application status is executed.

SAS Business Rules Manager makes it easy to combine rules sets into a rule flow and to publish those rule flows to the metadata server. After a rule flow has been published, it is available for use by other applications.

The SAS Intelligence Platform and SAS Business Rules Manager

The SAS Intelligence Platform architecture is a comprehensive, end-to-end infrastructure for creating, managing, and distributing enterprise intelligence. This architecture consists of the following tiers:
client tier
provides users with desktop access to data and functionality through an easy-to-use interface. With SAS Business Rules Manager, users author rule sets and rule flows through the SAS Business Rules Manager client.

middle tier
provides an environment in which the SAS Business Rules Manager web application can execute. The middle tier passes analysis and processing requests to the SAS servers.

server tier
provides SAS servers that process data and handle client requests. For SAS Business Rules Manager, the server tier provides the SAS Business Rules Engine.

data tier
stores your data. The SAS Decision Manager database contains all of the data that the user enters through the SAS Business Rules Manager Flex client application.

The following figure shows how SAS Business Rules Manager is deployed on the SAS Intelligence Platform.

**Figure 1.1 SAS Intelligence Platform Architecture and SAS Business Rules Manager**

SAS Business Rules Manager
the client application for SAS Business Rules Manager. Through this client application, users author vocabularies, rule sets, and rule flows.

SAS Decision Manager
manages requests to SAS Business Rules Manager and provides general SAS Decision Manager functions such as data source and workflow management.

SAS Web Infrastructure Platform
provides common SAS infrastructure services that SAS Business Rules Manager uses to authenticate users and to access services within the SAS platform.

SAS Business Rules Manager on the middle tier
manages communication with the SAS Decision Manager database and initiates the process of saving rule flows to the content repository.
SAS Web Infrastructure Platform Data Server
    serves as transactional storage for SAS middle-tier software and some SAS solutions software.

SAS Servers
    SAS application servers that execute SAS code that is submitted from the middle-tier applications.

SAS Decision Manager Common Data Server
    contains all of the data that users enter through the SAS Business Rules Manager client.

Metadata server
    contains the BusinessRuleFlow public metadata objects that are created when a rule flow is published. These objects are used by the integrated SAS applications to execute rule flows.

---

Process for Publishing Rule Flows

When a user publishes a rule flow, SAS Business Rules Manager creates an XML file and a BusinessRuleFlow metadata object. The XML file is stored in the content repository, and the metadata object is stored on the metadata server.

The following figure illustrates the process of publishing rule flows.

**Figure 1.2  Process for Publishing Rule Flows**

1. SAS Business Rules Manager reads the rule flow data in the SAS Decision Manager database.
3. The metadata object stores the XML file in the content repository.

Chapter 2
Performing Pre-installation Tasks

Pre-installation Steps

Before you install SAS Business Rules Manager, be sure to review the Pre-installation Checklist that is provided with your deployment plan. This checklist provides a detailed list of the pre-installation requirements. It also enables you to record important information that you need when you are installing the software.

Perform the following steps before you install SAS Business Rules Manager:

1. Verify that your system meets the minimum requirements. See the system requirements documentation on support.sas.com.

2. Determine the database that you want to use.
   
   Note: The SAS Decision Manager Common Data Server is always configured. Even if you use Oracle for the SAS Business Rules Manager database, you will be prompted for information for the SAS Decision Manager Common Data Server. After your system is configured and running, you can stop the SAS Decision Manager Common Data Server.

3. Determine the time zone requirements. You might need to synchronize the time zones that are specified in all of your operating environments.

4. Complete the pre-installation steps for your database. See “Pre-installation Tasks for SAS Decision Manager Common Data Server” on page 10 or “Pre-installation Tasks for an Oracle Database” on page 11.

5. (Optional) If you plan to configure the SAS Decision Manager Common Data Server for high availability, gather information about the high-availability cluster. For
Determine the Database to Use

You can use either Oracle or the SAS Decision Manager Common Data Server for the SAS Decision Manager database.

The SAS Decision Manager Common Data Server is based on PostgreSQL 9.5. For more information, see “SAS Web Infrastructure Platform Data Server” in SAS Intelligence Platform: Middle-Tier Administration Guide at http://support.sas.com/documentation/intellplatform/index.html. Ensure that you have the information listed in “Pre-installation Tasks for SAS Decision Manager Common Data Server” on page 10.

SAS Business Rules Manager supports Oracle 11g and Oracle 12c for the SAS Decision Manager database. For Oracle, complete the tasks described in “Pre-installation Tasks for an Oracle Database” on page 11.

Determine Time Zone Requirements

All of your operating environments (on all tiers in a multi-tier environment) must be set to the same time zone only if your site meets both of these conditions:

• You will deploy rule flows by using SAS Real-Time Decision Manager.
• Those rule flows use terms of type Date or Datetime.

SAS Real-Time Decision Manager uses a custom data type that accounts for differences between time zones when it performs calculations. If the time zones do not match across all of your environments, you should not use Date or Datetime data types in rule flows.

Pre-installation Tasks for SAS Decision Manager Common Data Server

During the installation and configuration of SAS Business Rules Manager, the SAS Deployment Wizard requires information about the database that SAS Business Rules Manager uses.

The SAS Decision Manager Common Data Server (based on PostgreSQL 9.5) is always configured when you run the SAS Deployment Wizard. You need the information in the following table in order to complete the steps in the SAS Deployment Wizard.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Type</td>
<td>Specifies the database type to use for the SAS Decision Manager database. Select <strong>SAS Decision Manager Common Data Server</strong>.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Database Name</td>
<td>Specifies the database name. The default name for the database is <strong>dcmdb</strong>.</td>
</tr>
<tr>
<td>Database User</td>
<td>Specifies the user name for the database administrator. This user owns the database and has superuser privileges. The default user name is <strong>dcmdbowner</strong>.</td>
</tr>
<tr>
<td>Database Password</td>
<td>Specifies a password for the user ID that is associated with the database account.</td>
</tr>
<tr>
<td>Port</td>
<td>Specifies the port that is used by the database. The default port for SAS Decision Manager Common Data Server is 10482.</td>
</tr>
<tr>
<td>Host Name</td>
<td>Specifies the fully qualified host name of the server on which the database is installed.</td>
</tr>
<tr>
<td>User ID</td>
<td>Specifies the user name for the user whose credentials will be used to access the SAS Decision Manager Common Data Server database. The default user name is <strong>dcmdb</strong>.</td>
</tr>
</tbody>
</table>

For database-specific information about configuring a database, see *SAS Intelligence Platform: Installation and Configuration Guide*.

---

**Pre-installation Tasks for an Oracle Database**

**Oracle Pre-installation Tasks**

If you are using Oracle for your SAS Decision Manager database, perform the following steps before you install SAS Business Rules Manager:

1. Verify that you have the correct JDBC drivers.
2. Verify that you have a tnsnames.ora file for your Oracle client that corresponds to your database.
3. Determine the required database information.
   
   **Note:** The SAS Decision Manager Common Data Server is always configured. Even if you use Oracle for the SAS Business Rules Manager database, you will be prompted for information for the SAS Decision Manager Common Data Server. See “Pre-installation Tasks for SAS Decision Manager Common Data Server” on page 10 for more information.
4. Specify the required database privileges.
5. Test the connection to your database.

**Verify JDBC Drivers for Oracle**

Verify that you have the correct JDBC drivers. To ensure proper installation of SAS Business Rules Manager, the drivers must be on each middle-tier server, and they must be in a directory that does not contain any other files.

**Determine the Information Required for the Oracle Database**

During the installation and configuration of SAS Business Rules Manager, the SAS Deployment Wizard requires information about the Oracle database that SAS Business Rules Manager uses. Record the information in the following table.

You enter this information in the SAS Decision Manager Database Properties and SAS Decision Manager Database JDBC Properties windows.

**Table 2.2 SAS Deployment Wizard Information for Oracle**

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Specifies the fully qualified host name of the server on which the database is installed.</td>
</tr>
<tr>
<td>Port</td>
<td>Specifies the port number that is used by the database. The default port for Oracle is 1521.</td>
</tr>
<tr>
<td>Directory containing JDBC driver jars</td>
<td>Specifies the location of the database vendor’s JDBC JAR file. This file must be available on the middle tier and on any machine on which you are deploying SAS Business Rules Manager in order to configure SAS Decision Manager database. See “Verify JDBC Drivers for Oracle” on page 11 for more information.</td>
</tr>
</tbody>
</table>
| Database SID or Service Name  | Specifies the Oracle database name. The database name must match either the service name or the Oracle site identifier (SID), both of which can be found in the tnsnames.ora file. For example:
  - (CONNECT_DATA = (SERVICE_NAME = mydb))
  - (CONNECT_DATA = (SID = mydb))
  You can also find the Oracle SID by running the following query using a database user ID on your Oracle instance:
  - select instance from v$thread
**Note:** If you select Use Oracle database name as a Service Name, then you must enter the service name that is specified in the tnsnames.ora file. For information about naming methods for Oracle databases, see the Oracle documentation for your database at https://docs.oracle.com/en/database/oracle/oracle-database/index.html. |
| User ID                       | Specifies the user ID of the database user whose credentials are used to access SAS Business Rules Manager data on the server.                |
| Password                      | Specifies the password of the user ID whose credentials are used to access SAS Business Rules Manager data on the server.                     |
| Schema Pattern                | Specifies the schema name for the database. The default schema name is the same as the user ID.                                            |

**Specify the Required Database Privileges for Oracle**

Ensure that the users of your database have the required database privileges. Here are the required privileges for Oracle databases:
• CONNECT
• CREATE SESSION
• RESOURCE
• CREATE TABLE
• CREATE VIEW
• CREATE SEQUENCE
• CREATE TRIGGER
• UNLIMITED TABLESPACE

Note: The UNLIMITED TABLESPACE privilege is automatically granted for Oracle Database 11g but not for Oracle Database 12c.

Test the Connection to Your Database

Execute a command from the terminal to verify that your database is set up. For example, to use an Oracle database, you can execute the following command using SQL*Plus:

```sql
sqlplus USER/PASSWORD@ORACLE_SID
```

You must be able to execute this command from any directory. If you are able to execute a database command such as this only from the database installation directory, then verify that the PATH variable is set up correctly. The database client application must be installed and available on the path specified by the PATH variable.
Chapter 3
Installing SAS Business Rules Manager

Products Installed with SAS Business Rules Manager

Running the SAS Deployment Wizard

About Running the SAS Deployment Wizard

To run the SAS Deployment Wizard, follow the instructions in “Install and Configure SAS Interactively” in SAS Intelligence Platform: Installation and Configuration Guide.

Note: You can run the wizard on operating systems that do not use a windowing environment. For more information, see SAS Deployment Wizard and SAS Deployment Manager: User's Guide at http://support.sas.com/documentation/installcenter/94/index.html.

The type and number of configuration-related pages that you see depend on the prompt level that you choose, the SAS tier that you are currently deploying, and the contents of your SAS 9.4 custom order. The following topics provide information for prompts that are specific to SAS Business Rules Manager. For additional information about any of the SAS Deployment Wizard prompts, see the online Help for the wizard page in question.
Select the SAS Application Server

If you are installing SAS Business Rules Manager as an add-on product and have already defined other SAS application servers, the SAS Deployment Wizard asks you to select which application server you want to use. Select an application server other than SASMETA.

Configure the Database

During deployment of SAS Business Rules Manager on SAS 9.4, the SAS Deployment Wizard creates and configures the database tables in the SAS Decision Manager Common Data Server database by default. This database uses the PostgreSQL database management system.

You can use a third-party database server with SAS 9.4. In SAS 9.4, Oracle is the only other third-party database management system that is supported for the SAS Decision Manager database. For information about which versions of the alternative databases are supported, see “Reviewing Third-Party Database Requirements” in SAS Intelligence Platform: Installation and Configuration Guide.

The SAS Deployment Wizard prompts you to enter the information that you gathered when you completed the pre-installation tasks for your database. See “Pre-installation Tasks for SAS Decision Manager Common Data Server” on page 10 and “Pre-installation Tasks for an Oracle Database” on page 11 for more information.

For database-specific information about configuring a database, see SAS Intelligence Platform: Installation and Configuration Guide.

Create and Load Tables through the SAS Deployment Wizard

If you select SAS Decision Manager Common Data Server as the database type, the database tables are automatically created and loaded during the installation and configuration process for the SAS Decision Manager Common Data Server. The default name for the database is dcmdb.

If you select Oracle as the database type, the Automatically create tables and load data check box in SAS Deployment Wizard is enabled. If you want the Oracle database tables to be created and loaded automatically, leave this box selected. If you want to create the tables yourself, then clear the check box, and submit the necessary SQL statements after the wizard finishes running. See “Create Oracle Database Tables” on page 23 for more information.

Post-installation Configuration and Verification Steps

After you install SAS Business Rules Manager using SAS Software Depot, you must perform additional configuration steps before you can use SAS Business Rules Manager.

1. Verify that all installation and configuration steps in the Instructions.html file have been completed. The Instructions.html file is located in \SAS-configuration-directory\Levn\Documents. Follow the instructions that are provided in this file.

2. Create application users and assign permissions.
3. (Optional) If you are using the SAS Decision Manager Common Data Server for the SAS Decision Manager database, you can configure the data server for high availability. For instructions, see the technical paper Managing SAS Web Infrastructure Platform Data Server High-Availability Clusters on UNIX.

4. (Optional) Run the scripts to create Oracle synonyms in the database if you do not want to use the default Oracle schema.

5. If you cleared the **Automatically create tables and load data** check box during installation, then you must manually create and load the Oracle database tables for business rules data. For more information, see “Create Oracle Database Tables” on page 23.

6. Verify that the Certificate Authority certificate is available.

7. (Optional) Configure your deployment to use HTTPS.

8. (Optional) Add the Visual Analytics: Data Building and Data Management: Lineage roles to the Decision Manager Users group. See “Administering Group and Role Membership” on page 48 for more information. These roles enable users to run SAS Visual Data Builder and view lineage information for rule flows.

11. (Optional) Modify log file settings.

12. (Optional) If you are using Oracle for the SAS Decision Manager database, you can stop the SAS Decision Manager Common Data Server.

For more information about post-installation tasks, see *SAS Intelligence Platform: Installation and Configuration Guide*.

---

### Create Users and Assign Permissions

The SAS Deployment Wizard does not create application users by default. The SAS Administrator must create users in SAS Management Console with the appropriate group and role permissions. Make sure that all users are granted the appropriate permissions to the SAS Workspace Server. For more information, see Chapter 7, “Configuring Users, Groups, and Roles,” on page 43.

In a Windows environment, each user or group must be granted permission to the **Log on as a batch job** local security policy. This permission is required in order to access functionality in the Data category. For more information, see “Create Windows Operating System Accounts and Groups for Users” on page 19.

In a UNIX environment, all SAS Business Rules Manager users must be part of a group that has the appropriate group permissions. For more information, see “Create UNIX Operating System Accounts and Groups for Users” on page 20.
Creating Operating System Accounts for Product Administrators and Users

About the User Accounts for SAS Business Rules Manager

SAS Business Rules Manager provides two types of user accounts:

Product administrator

A SAS Business Rules Manager administrative user is specific to SAS Business Rules Manager. A product administrator account is not the same as a general administrator account, such as the SAS Administrator (sasadm@saspw). These users must have a valid host operating system account, and you must associate that account with a metadata user.

Users of SAS Business Rules Manager

These users must have a valid host operating system account, and you must associate that account with a metadata user through SAS Management Console.

You must create the operating system account for the administrator and for regular user accounts as a post-installation task. For more information, see the following topics:

- “Create Windows Operating System Accounts and Groups for Users”
- “Create UNIX Operating System Accounts and Groups for Users”
- Chapter 7, “Configuring Users, Groups, and Roles,”

Using Operating System Groups to Assign Permissions

Users have different operating system privileges on the SAS Workspace Server. By defining a user group for SAS Business Rules Manager, you can assign all users to the same group and grant the same permissions to all users at one time. All SAS Business Rules Manager users must have Read, Write, and Execute permissions for each environment directory that a user is permitted to use. Users also need permissions to all of the files and directories in an environment directory. The operating system must be configured to grant these permissions when new files and directories are created. The steps that you follow to do this depend on which operating system groups are defined and your site’s security policies.

Create Windows Operating System Accounts and Groups for Users

On the SAS Workspace Server, create an operating system account for the administrator of SAS Business Rules Manager and all SAS Business Rules Manager users.

If the SAS Workspace Server is running in the Windows operating environment, use one of the following methods to create this operating system account:

- If you are using an LDAP server to manage your users, define the user (for example, domain\username) on the Active Directory server.
- If you are working on a local machine, complete these steps to create this user account:
  1. Right-click the Computer icon on your desktop and select Manage. The Computer Management window appears.
If you are creating users on a server, you can use the Server Manager.

2. In the left navigation pane, expand the Local Users and Groups node. The Users and Groups nodes appear.

3. Right-click the Users node and select New User. The New User window appears.

4. In the New User window, complete these tasks:
   - Specify a user name and password.
     
     Note: In Windows, you cannot enter <domain>\username (you enter the user name only), but you must enter <domain>\username in the SAS Deployment Wizard and SAS Management Console.
     - Clear the User must change password at next logon check box.
     - Select the User cannot change password check box.
     - Select the Password never expires check box.
   - Click Create.

5. Click Close to close the New User dialog box.

6. If you want to add the users that you created to a group, perform the following steps:
   a. Right-click the Groups node in the Computer Management window, and select New Group.
   b. Click Add. Enter the user names, separated by semicolons, and click Check Names.
   c. Click OK.

7. Assign the security policy of Log on as batch job for each user or group.
   b. From the Local Security Policy window, expand the Local Policies node and select User Rights Assignment. Then double-click the Log on as batch job policy.
   c. Click Add user or Group. Enter the user names or group names, separated by semicolons, and click Check Names.
   d. Click OK.

Create UNIX Operating System Accounts and Groups for Users

Conditions for the User Group

If you are working in a UNIX operating environment, the following conditions must be met:

- A group of users is created for the UNIX operating environment. The logon IDs for each user must be in this group. The group must also include any user who might run code that is created by SAS Business Rules Manager in a SAS session.
- Users can be members of multiple groups, but the SAS Business Rules Manager group is the primary group for each user.
The SAS scripts are updated to grant permissions to the SAS Business Rules Manager users on the SAS Workspace Server. For more information, see “Update the SAS Scripts to Grant Permissions to the User Group” on page 21.

Each environment directory has the correct ownership, and the user group has Read, Write, and Execute permissions.

Update the SAS Scripts to Grant Permissions to the User Group

Using the `umask` option, you can grant permissions to users on a conditional basis if the user is part of the SAS Business Rules Manager user group.

Note: This example might require changes to fit your server configuration. In particular, this example could result in changed permissions on other SAS files, such as OLAP cubes. For example, if you are working with multiple UNIX groups and have a SAS OLAP Server, you must ensure that the account under which the SAS OLAP Server runs has Read and Execute permissions to OLAP files.

To set these permissions:

2. Enter the configuration information for your operating environment. Here is the general format of this code:

   Note: The following code uses grave accents and not quotation marks.

   ```
   CMD=<your-operating-system-path>
   CURR_GID=`eval $CMD -g`
   GID=<solution-group-id>
   if [ $CURR_GID -eq $GID ]; then umask 002 fi
   ```

   1 In the `CMD=<your-operating-system-path>`, specify the full path on your server where the ID command is stored. You can get this information by entering a `which id` or `whence id` command on your console.

   2 In the `GID=<solution-group-id>`, specify the group ID. Type `id` on your console to get the GID and UID information.

   3 A value of 002 is recommended for the `umask` option.

Here are code examples for each UNIX environment where SAS Business Rules Manager is supported:

<table>
<thead>
<tr>
<th>Operating Environment</th>
<th>Sample Code</th>
</tr>
</thead>
</table>
| AIX                     | `CMD=/usr/bin/id`
                        | `CURR_GID='eval $CMD -g'`          |
                        | `GID=201`                            |
                        | `if [ $CURR_GID -eq $GID ]; then umask 002 fi` |
| H64I (HP-Itanium)       | `CMD=/usr/bin/id`
                        | `CURR_GID='eval $CMD -g'`          |
                        | `GID=201` if [ $CURR_GID -eq $GID ] ; then umask 002 fi |

Operating Environment | Sample Code
---|---
S64 (Solaris) | CMD=/usr/xpg4/bin/id
CURR_GID='eval $CMD -g'
GID=201 if [ $CURR_GID -eq $GID ] ; then umask 002
fi

SAX (Solaris for X64) | CMD=/usr/xpg4/bin/id
CURR_GID='eval $CMD -g'
GID=201
if [ $CURR_GID -eq $GID ] ; then umask 002
fi

LNX (Linux) | #!/bin/bash
CMD=/usr/bin/id
CURR_GID='eval $CMD -g'
GID=500
if [ "$CURR_GID" -eq "$GID" ] ; then umask 002
fi

Create Oracle Database Synonyms

If you use Oracle for your SAS Decision Manager database and you do not want to use the default schema, you can run two SQL scripts to create synonyms for the database tables. These scripts are in SASHome\SASDecisionManagerCommonDataServer\3.2\Config\Deployment\dbscript\Oracle\optional. Use your preferred Oracle tool to run these scripts. One of these scripts, brm_grant_priv_synonym.sql, uses substitution variables. If your Oracle tool does not support substitution variables, then you need to manually replace the variable with its value, as described in Step 2.

To run these scripts:

1. In the script named brm_grant_priv_synonym.sql, find the following line:
   
   ```
   def usernm='YOUR_USER_NAME';
   ```

   Replace **YOUR_USER_NAME** with the user ID that you are using to access the SAS Decision Manager database.

   If your Oracle tool supports substitution variables, skip to Step 3. If not, continue with Step 2.

2. If your Oracle tool does not support substitution variables, in the script named brm_grant_priv_synonym.sql, replace all occurrences of `&usernm` with the user ID that you are using to access the database.

3. Run the script named brm_create_synonym.sql using your preferred Oracle tool. This script does not require substitution variables.

4. Run brm_grant_priv_synonym.sql using your preferred Oracle tool.
Create Oracle Database Tables

When you ran the SAS Deployment Wizard, the **Automatically create tables and load data** check box was selected by default for the SAS Decision Manager database. (See “Create and Load Tables through the SAS Deployment Wizard” on page 16.) If you cleared the **Automatically create tables and load data** check box and you do not have an existing database instance, you must run the SQL scripts to create and load the tables.

Run the following scripts to create the business rules tables with a compatible database client for your installation. These scripts are located in

```plaintext
SASHome\SASDecisionManagerCommonDataServer\3.2\Config\Deployment\dbscript\oracle.
```

Before you run these scripts, replace `@schema.name@` in each file with the schema name for your database.

1. `brm_create_table.sql`
2. `brm_create_sequence.sql`
3. `brm_create_constraint.sql`
4. `brm_create_view.sql`
5. `brm_required_inserts.sql`
6. `edm_workflow_interface_create_table.sql`
7. `edm_workflow_interface_create_sequence.sql`
8. `edm_workflow_interface_create_constraint.sql`
9. `edm_workflow_interface_create_trigger.sql`
10. `edm_workflow_interface_required_inserts.sql`
11. `edm_create_table.sql`
12. `edm_create_constraint.sql`
13. `edm_create_sequence.sql`
14. `edm_required_inserts.sql`
15. `dcb_create_table.sql`
16. `dcb_create_constraint.sql`
17. `dcb_required_inserts.sql`

**Note:** The data model for all tables is the same for SAS Business Rules Manager 3.1 and 3.2 except for the business rules (brm) tables. The data model version for business rules tables is version 3.2.

---

**Verify the Certificate**

During installation and configuration of SAS 9.4, the SAS Deployment Wizard enables you to configure the SAS Web Server to use HTTPS and Secure Sockets Layer (SSL) certificates automatically. Verify that the Certificate Authority certificate is available to
the trust store for the browser and Java clients such as SAS Workflow Studio and SAS Management Console. For more information, see the Instructions.html file in the directory \SAS-configuration-directory\Lev\Web\Documents, and “Validating the Secured Middle-Tier Environment” in SAS Intelligence Platform: Middle-Tier Administration Guide.

If you did not use the SAS Deployment Wizard to configure the SAS Web Server to use HTTPS and SSL certificates, you can configure it manually. For more information, see “Configuring SAS Web Server Manually for HTTPS” in SAS Intelligence Platform: Middle-Tier Administration Guide.

The communication path between SAS Web Server and SAS Web Application Server uses HTTP by default. If you configured the SAS Web Server to use HTTPS by using the SAS Deployment Wizard, you must complete additional steps in order to use HTTPS between SAS Web Server and SAS Web Application Server. For more information, see “Configuring SAS Web Application Server to Use HTTPS” in SAS Intelligence Platform: Middle-Tier Administration Guide. If you configure the SAS Web Application Server to use HTTPS, see “Configure Your Deployment for HTTPS” on page 24 for additional instructions.

Configure Your Deployment for HTTPS

The steps listed in “Configuring SAS Web Application Server to Use HTTPS” in SAS Intelligence Platform: Middle-Tier Administration Guide change the communication path between the SAS Web Server and SAS Web Application Server to use HTTPS. If you completed those steps and configured the communication path to use HTTPS, then you must also configure the SAS Web Application Server to use HTTPS.

To configure the SAS Web Application Server to use HTTPS:

1. Edit the setenv file for your operating environment.

<table>
<thead>
<tr>
<th>Environment</th>
<th>File</th>
<th>Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIX</td>
<td>setenv.sh</td>
<td>/SAS-configuration-directory/Levn/Web/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WebAppServer/SASServer7_1/bin</td>
</tr>
<tr>
<td>Windows</td>
<td>setenv.bat</td>
<td>\SAS-configuration-directory\Lev\Web\</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WebAppServer\SASServer7_1\bin</td>
</tr>
</tbody>
</table>

Add the following options to the JVM_OPTS line:

-Dbcm.midtier.use.https=true

2. In Windows environments, edit the wrapper.conf file in the \SAS-configuration-directory\Lev\Web\WebAppServer \SASServer7_1\conf directory.

Add the following line to the Java Additional Parameters section:

wrapper.java.additional.n=-Ddcm.midtier.use.https=true

The number n is the next number in the sequence of wrapper parameters.

Note: The options are needed only on SASServer7; they are not needed on SASServer11.

Review Application Properties in SAS Management Console

Review Properties

Review the application properties in SAS Management Console to ensure that the values are appropriate for your environment. Complete the following steps:

1. In SAS Management Console, select the Plug-ins tab.
2. Select Application Management ➔ Configuration Manager ➔ SAS Application Infrastructure ➔ Enterprise Decision Manager 3.2.
   Note: If you are migrating to SAS Business Rules Manager 3.2, SAS Management Console displays the release number that you are migrating from. For example, if you are migrating from SAS Business Rules Manager 2.2, SAS Management Console displays Business Rules Manager 2.2.
4. Click the Settings tab. Review the properties listed in “Business Rules Manager Web Settings” on page 25. Click to enable editing for a property.
6. Click OK to close the Business Rules Manager Web 3.2 Properties dialog box.
7. Right-click Decision Manager 3.2 and select Properties. The Decision Manager 3.2 Properties dialog box appears.
8. Click the Advanced tab. Review the properties listed in “Decision Manager Advanced Properties” on page 28.
9. Click OK to close the Decision Manager 3.2 Properties dialog box.
10. Right-click Decision Manager Common Mid 3.2 and select Properties. The Decision Manager Common Mid 3.2 Properties dialog box appears.
11. Click the Advanced tab, and review the setting of the edm.datasource.summary.maxrowcount property. This property specifies the maximum number of rows for data table summaries.
12. Click OK to close the Decision Manager Common Mid 3.2 Properties dialog box.
13. Restart SASServer7. You must restart the server in order for changes to configuration properties to take effect.

Business Rules Manager Web Settings

Location of Code generation macro
the location of the macro that generates the SAS code for rule sets and rule flows.
This property is used only by rule flows that were published using the first
maintenance release of SAS Business Rules Manager 1.2. It is not used by rule flows published with later versions.

**Max row count per table**
the maximum number of rows per rule flow test table. This property applies only to the first maintenance release of SAS Business Rules Manager 1.2, to SAS Business Rules Manager 2.1, and to SAS Decision Manager 2.1. It is not used by later versions.

**Temporary test code generation directory**
applies only to SAS Business Rules Manager 1.2 and the first maintenance release of SAS Business Rules Manager 1.2. This directory is not used by later versions.

**Largest allowed uploaded lookup table row count**
the maximum number of rows that can be uploaded for a lookup table. The default is 5000. This value should not exceed 10,000.

**Maximum Testing Log Length (in lines) of SAS log displayed within User Interface**
the maximum number of lines from the SAS log that are displayed on the SAS log section on the **Results** tab for the rule flow.

**Support macros in rule expressions**
determines whether macros are allowed in rule expressions.

*Note:* Macros are not supported in decision flows that are deployed by SAS Real-Time Decision Manager or in decisions that are published and run in the SAS Micro Analytic Service.

**Temporary Location used in Rule Generation**
a temporary directory that SAS Business Rules Manager uses while it generates the SAS code for vocabularies, rule sets, and rule flows. A best practice is to specify a directory that is outside of the SAS configuration directory.

**Test Library Root File System Directory**
the directory where rule flow tests and test results are saved. As users create additional rule flow tests, administrators might need to delete old test results, or ask users to delete old test cases. A best practice is to specify a directory that is outside of the SAS configuration directory.

*Note:* If you are running tests that use data sources that are in a distributed environment such as the Hadoop Distributed File System (HDFS), ensure that the SAS Server file system has enough space to accommodate output data in the form of SAS data sets. If sufficient space is not available, you might need to create subsets of the input data to use for testing.

**Test Metadata Library Root Directory**
the folder in which metadata for rule flow tests is stored.

---

**Business Rules Manager Web Advanced Properties**

- **brm.csvfile.separator**
  the character that is used as a separator in CSV files that are used to create lookup tables through the SAS Business Rules Manager interface.

- **brm.datagrid.type.enabled**
  enables the use of data grid variables and functions in rule flows. Contact SAS Technical Support for more information.
brm.folder.config.enabled
enables you to control access to folders. When this property is set to true, you can
define a role for a business rules folder administrator. Users assigned to this role
control which user group has access to a folder.

Setting brm.folder.config.enabled to true disables the ability to import and export
business rules content from the SAS Decision Manager database. Business rules
content includes business rules folders, vocabularies, terms, lookup tables, rule sets,
and rule flows. See “Enable Business Rules Folder Administration” on page 51 for
more information.

You can enable the role of folder administrator and still allow content to be imported
and exported by setting brm.import.restriction.override to true.

brm.import.restriction.override
specifies whether business rules content can be imported to and exported from the
SAS Decision Manager database when the brm.folder.config.enabled property is set
to true.

brm.lookup.file.upload.encoding
the character encoding for files that contain lookup tables that will be imported
through the user interface. The default encoding is UTF-8. The supported encodings
are listed in Oracle Java SE documentation at https://docs.oracle.com/javase/7/docs/
technotes/guides/intl/encoding.doc.html.

brm.rulegen.mba.maxrowcount
the maximum number of rows for output tables that are generated by the Market
Baskets discovery technique.

brm.rulegen.rfm.maxrowcount
the maximum number of rows for output tables that are generated by the Recency
Frequency Monetary discovery technique.

brm.rulegen.scorecard.maxrowcount
the maximum number of rows for output tables that are generated by the Scorecard
discovery technique.

brm.rulegen.tree.maxrowcount
the maximum number of rows for output tables that are generated by the Decision
Tree discovery technique.

brm.runtime.codetype
determines whether SAS Business Rules Manager generates DS2 code or DATA step
(DS1) code for rule flows. In many cases, you will get better performance by
specifying DS1. However, consider specifying DS2 if your input data is in Teradata,
Greenplum, or Hadoop, and you have installed the SAS Code Accelerator. In
addition, the LIKE operator is not supported for DS1.

Note: If you are migrating or upgrading to SAS Business Rules Manager 3.2, this
property is not defined. You can add it as a new property.

brm.testing.char.length.override
the maximum number of characters for action terms that are defined as character
variables and that are not mapped to input variables. This value is used when rule
flows are tested in SAS Business Rules Manager.

brm.default.application.server.context.override
the default application server for rule flow testing. You can specify the short logical
name such as SASApp. If a value is not specified for this property, SAS Business
Rules Manager looks for a server context named SASApp. If that server context does
not exist, SAS Business Rules Manager uses the last one returned from the metadata
server.

Review Application Properties in SAS Management Console 27
Note: This property is not predefined. You can add it as a new property.

**Decision Manager Advanced Properties**

**Logon.Style**
the default theme used by the SAS Business Rules Manager interface.

**dcb.default.application.server.context.override**
the default application server for decision testing. You can specify the short logical name such as SASApp. If a value is not specified for this property, SAS Business Rules Manager looks for a server context named SASApp. If that server context does not exist, SAS Business Rules Manager uses the last one returned from the server service.

Note: This property is not automatically added for migrations or upgrades.

**services.rootscsfolder**
the root folder for the SAS Content Server. Do not change this value.

---

**Modify Log File Settings**

**Log4j Configuration File**

SAS Business Rules Manager uses log4j to perform logging. When SAS Business Rules Manager starts, the log4j configuration file for the web application is read from `SAS-configuration-directory\Lev\Web\Common\LogConfig\SASBusinessRulesManagerWeb-log4j.xml`. This file is a standard log4j configuration file.

You should not change the existing categories or root logger in a configuration file unless you are instructed to do so by SAS Technical Support.

Note: If you make any changes to the log4j configuration file, you must restart SASServer7 for the changes to take effect.

**Logging Priority Levels**

You can change the logging priority levels in a log configuration file if needed.

<table>
<thead>
<tr>
<th>Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG</td>
<td>The most verbose logging level. This level displays information that is most useful for debugging an application. SAS Business Rules Manager should run under this priority only for capturing additional log information. This priority level is not an acceptable priority level for the day-to-day operation of SAS Business Rules Manager.</td>
</tr>
<tr>
<td>Priority</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>INFO</td>
<td>Verbose logging level. This level displays messages that highlight the progress of an application. SAS Business Rules Manager should run under this priority only for capturing additional log information. This priority level is not an acceptable priority level for the day-to-day operation of SAS Business Rules Manager.</td>
</tr>
<tr>
<td>WARN</td>
<td>Restrictive logging. This level displays information about potentially harmful situations and is an acceptable priority for the day-to-day operation of SAS Business Rules Manager.</td>
</tr>
<tr>
<td>ERROR</td>
<td>The most restrictive logging level. This level displays error events and is an acceptable priority for the day-to-day operation of SAS Business Rules Manager.</td>
</tr>
</tbody>
</table>

**Log Files**

SAS Business Rules Manager writes information to the following log files:

SASBusinessRulesManagerWeb3.2.log
contains messages from SAS Business Rules Manager

SASDecMgrCommon3.2.log
contains messages from the Workflow and Data plug-ins

SASDecMgrShell3.2.log
contains general messages from the Shell

By default, SAS Business Rules Manager writes log files to
`SAS-configuration-directory\Lev\Web\Logs\SASServer7_1\`. You can change the location of these log files in the configuration file. Changes to the configuration file take effect when the middle-tier application server is restarted. See “Administering Logging for SAS Web Applications” in *SAS Intelligence Platform: Middle-Tier Administration Guide* for more information about this configuration file.

SAS Business Rules Manager creates new log files each day. For information about logging configurations, see “Modifying Your Server Logging Configurations” in *SAS Intelligence Platform: System Administration Guide*.

**Turn on SQL Logging**

To turn on SQL logging and write SQL parameter values for each query to the log file, add the following categories to the log4j.xml configuration file:

```xml
<category additivity="false" name="org.hibernate.type">
  <priority value="TRACE"/>
  <appender-ref ref="SAS_FILE"/>
</category>

<category additivity="false" name="org.hibernate.SQL">
  <priority value="DEBUG"/>
  <appender-ref ref="SAS_FILE"/>
</category>
```
Manage Directories for Business Rules Content

SAS Business Rules Manager creates two directories for business rules metadata: *Products* and */System*.

SAS Business Rules Manager creates a location for published XML files, *sasdav/Products*. The BusinessRuleFlow metadata object does not delete the XML documents stored in this location in order to ensure that an audit trail is maintained.

Before you delete any XML content from *sasdav/Products*, you should do the following:

1. Back up all versions of the content. The easiest way to back up the content is to use SAS Management Console to export the BusinessRuleFlow object that refers to the content.

2. Ensure that no BusinessRuleFlow objects refer to the content.

For content that was published with an earlier release of SAS Business Rules Manager, the current release of SAS Business Rules Manager continues to use the original publish location. Do not delete directories created by earlier releases of SAS Business Rules Manager.
# Chapter 5
Performing Migration Tasks

## About the Migration Process

You can migrate from any release of SAS Business Rules Manager to SAS Business Rules Manager 3.2.

The SAS Business Rules Manager migration process supports migrating to a database from the same vendor as the database that you are currently using. Migrating from a database based on Oracle to a database based on PostgreSQL, or vice versa, is not supported.

If you are using Oracle for your database, the migration process assumes that the migrated environment uses the same instance of Oracle. The migration process does not support moving to a different Oracle database server.

## Pre-migration Steps

For information about the pre-migration tasks that you must perform, see “Performing Pre-migration Tasks” in *SAS Intelligence Platform: Migration Guide*. Here are some important steps to help with your migration:

- Back up your SAS system, including servers and desktop clients.
- Back up the your database if you are migrating from SAS Business Rules Manager 2.1 or later to SAS Business Rules Manager 3.2 on a SAS 9.4 system.
- If you are moving to a new system, ensure that the required operating system user accounts that you use for SAS in your current operating system also exist in your new operating system.

## Post-migration Steps

- Overview of Post-migration Steps
- Copying Rule Flow Test Results
- Migrate to Version 3.2 for Oracle
- Migrate to Version 3.2 for SAS Decision Manager Common Data Server

<table>
<thead>
<tr>
<th>Section</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>About the Migration Process</td>
<td>31</td>
</tr>
<tr>
<td>Pre-migration Steps</td>
<td>31</td>
</tr>
<tr>
<td>Post-migration Steps</td>
<td>33</td>
</tr>
<tr>
<td>Overview of Post-migration Steps</td>
<td>33</td>
</tr>
<tr>
<td>Copying Rule Flow Test Results</td>
<td>34</td>
</tr>
<tr>
<td>Migrate to Version 3.2 for Oracle</td>
<td>34</td>
</tr>
<tr>
<td>Migrate to Version 3.2 for SAS Decision Manager Common Data Server</td>
<td>35</td>
</tr>
</tbody>
</table>
• Before you migrate to SAS Business Rules Manager 3.2, you should record the database settings in your current environment. Verify that these settings are entered in the SAS Deployment Wizard when you run the migration.

• If you are migrating from SAS Business Rules Manager 2.1 and you are using the SAS Web Infrastructure Platform Data Server for your database, record the database name and the user ID for the database. The default database name is brmdb.

You can find the database name in the /SAS-configuration-directory/Lev/1n/Web/WebAppServer/SASServer7_1/conf/server.xml file on the middle-tier server. Find the resource with the name sas/jdbc/dcmSharedDataSource, and look for the value of the url attribute. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is url="jdbc:postgresql://host:10482/brmdb", then the database name is brmdb.

• If you are migrating from SAS Business Rules Manager 2.2 or later, record the database name and the user ID for your SAS Decision Manager Common Data Server database. The default database name is dcmdb.

You can find the database name in the /SAS-configuration-directory/Lev/1n/Web/WebAppServer/SASServer7_1/conf/server.xml file on the middle-tier server. Find the resource with the name sas/jdbc/DecisionManagerDS, and look for the value of the url attribute. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is url="jdbc:postgresql://host:10482/dcmdb", then the database name is dcmdb.

• If you are using Oracle for your database, ensure that the Oracle client is installed on your server tier and that there is a matching tnsnames.ora file that corresponds to your database.

• If you are using Oracle for your database, record the information that is listed in the following table.

You enter this information in the SAS Decision Manager Database Properties and SAS Decision Manager Database JDBC Properties windows.

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Specifies the fully qualified host name of the server on which the database is installed.</td>
</tr>
<tr>
<td>Port</td>
<td>Specifies the port number that is used by the database. The default port for Oracle is 1521.</td>
</tr>
<tr>
<td>Directory containing JDBC driver jars</td>
<td>Specifies the location of the database vendor’s JDBC JAR file. This file must be available on the middle tier and on any machine on which you are deploying SAS Business Rules Manager in order to configure SAS Decision Manager database. See “Verify JDBC Drivers for Oracle” on page 11 for more information.</td>
</tr>
<tr>
<td>Prompt</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Database SID or Service Name</strong></td>
<td>Specifies the Oracle database name. The database name must match either the service name or the Oracle site identifier (SID), both of which can be found in the tnsnames.ora file. For example: (CONNECT_DATA = (SERVICE_NAME = mydb))</td>
</tr>
<tr>
<td></td>
<td>(CONNECT_DATA = (SID = mydb))</td>
</tr>
<tr>
<td></td>
<td>You can also find the Oracle SID by running the following query using a database user ID on your Oracle instance: select instance from v$thread</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> If you select <strong>Use Oracle database name as a Service Name</strong>, then you must enter the service name that is specified in the tnsnames.ora file. For information about naming methods for Oracle databases, see the Oracle documentation for your database at <a href="https://docs.oracle.com/en/database/oracle/oracle-database/index.html">https://docs.oracle.com/en/database/oracle/oracle-database/index.html</a>.</td>
</tr>
<tr>
<td><strong>User ID</strong></td>
<td>Specifies the user ID of the database user whose credentials are used to access SAS Business Rules Manager data on the server.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>Specifies the password of the user ID whose credentials are used to access SAS Business Rules Manager data on the server.</td>
</tr>
<tr>
<td><strong>Schema Pattern</strong></td>
<td>Specifies the schema name for the database. The default schema name is the same as the user ID.</td>
</tr>
</tbody>
</table>

- If you are using Oracle for your database, verify that you have the correct JDBC drivers. For more information, see “Verify JDBC Drivers for Oracle” on page 11.
- Use the SAS Migration Utility to create a migration package. For more information, see “SAS Migration Utility Reference” in *SAS Intelligence Platform: Migration Guide*.

### Post-migration Steps

**Overview of Post-migration Steps**

After you have migrated to SAS Business Rules Manager 3.2 on the fourth maintenance release of SAS 9.4, perform the following post-migration steps:

1. Copy or move the contents of the rule flow testing directories. See “Copying Rule Flow Test Results” on page 34 for more information.

2. Run the appropriate migration script to migrate your database to SAS Business Rules Manager 3.2. See the following topics for additional information:
   - “Migrate to Version 3.2 for Oracle” on page 34
   - “Migrate to Version 3.2 for SAS Decision Manager Common Data Server” on page 35

*Note:* If you are migrating from SAS Business Rules Manager 3.2 to 3.2 (hardware upgrade) and you are using Oracle for your database, you do not need to run a migration script.
3. (Optional) Configure your deployment to use HTTPS. See “Configure Your Deployment for HTTPS” on page 24 for more information.

4. Update your user group memberships, authorization, roles, and capabilities as needed. See “Updating Groups and Roles for SAS Business Rules Manager 3.2” on page 51 for more information.

5. (Optional) Add the Visual Analytics: Data Building and Data Management: Lineage roles to the Decision Manager Users group. See “Administering Group and Role Membership” on page 48 for more information. These roles enable users to run SAS Visual Data Builder and view lineage information for rule flows.

6. Review the configuration properties in SAS Management Console. Ensure that the values are appropriate for the new environment. See “Review Application Properties in SAS Management Console” on page 25 for more information.

7. (Optional) If you are migrating from SAS Business Rules Manager 2.1, perform post-installation configuration and verification steps for SAS Workflow. For more information, see “Configuring SAS Workflow for Use with SAS Business Rules Manager” on page 57.

**Copying Rule Flow Test Results**

Rule flow testing results are not automatically migrated. For any results that you want to access with SAS Business Rules Manager 3.2:

1. Copy the test results from your old deployment to the new deployment. The directory path for rule flow test results is specified by the Business Rules Manager Web property **Test Library Root File System Directory** in SAS Management Console. You must use the same directory path in the new deployment. See “Review Application Properties in SAS Management Console” on page 25 for more information.

2. (Optional) If you are running in a UNIX operating environment and the user that needs to access the test results is different from the current user, use the `chown -R` command to change the ownership of the testing folders. For more information, refer to the UNIX man page for the `chown` command.

3. Update the relationship information for the test results so that users can view the test results and re-run the test cases. To update the relationship information, run the following REST service:

   ```
   http://host:port/SASBusinessRulesManagerWeb/rest/RuleflowTestLibMigrate
   ```

**Migrate to Version 3.2 for Oracle**

The scripts for migrating an Oracle database are located in the following directory:

```
SASHome/SASDecisionManagerCommonDataServer/3.2/Config/Deployment/dbscript/oracle/migration/.
```

To migrate an Oracle database to SAS Business Rules Manager 3.2, run the `migration_brm_version_to_brm_3.2.sql` script for your current release of SAS Business Rules Manager.

For example, you can use SQL*Plus to run the script to migrate from SAS Business Rules Manager 2.2 to 3.2 as follows:

```bash
sqlplus username@tnsname @/install/SASHome/
```
**Migrate to Version 3.2 for SAS Decision Manager Common Data Server**

If you are migrating from SAS Business Rules Manager 2.1 or later to 3.2 and you are using the SAS Decision Manager Common Data Server, you must run the database migration script for your operating environment. Run this script on the target middle-tier machine where the SAS Decision Manager Common Data Server is running.

1. Verify that the SAS Decision Manager Common Data Server is running on both the source and target machines.
2. Shut down all SAS Web Application Server processes.
3. Run the database migration script for your operating environment. The script for Windows platforms is named `postgres-migration.bat`, and the script for UNIX platforms is named `postgres-migration.sh`. They are located in the following directory:

   ```
   SASHome/SASDecisionManagerCommonDataServer/3.2/Config/Deployment/Migration/
   ```

   **Note:** This directory contains a README.TXT file that contains information about the parameters for these scripts.

   When you run the migration script, substitute the correct values for the release you are migrating from, the server name, port number, and user ID for your database. The script prompts you to enter a password. The syntax for these scripts is as follows:

   ```
   postgres-migration.[bat | sh] SASHome version source_port source_host source_user source_db_name target_port target_host target_admin target_user target_db_name <target_exists>
   ```

   - **SASHome** specifies the SAS Home installation directory location. In Windows operating environments, it is recommended that you enclose this parameter in double quotation marks.
   - **version** specifies the version number of your current (source) database from which you are migrating content. Specify `2.1`, `2.2`, `3.1`, or `3.2`.
   - **source_port** specifies the port number of the database from which you are migrating content.
   - **source_host** specifies the host name of the database from which you are migrating content.
   - **source_user** specifies the user ID for Decision Manager Common Middle Tier. This value must be a user ID that has access to all of the database content that needs to be migrated. You can find the correct value for this parameter in the `/SAS-configuration-directory/LevN/Web/WebAppServer/ SASServer7_1/conf/server.xml` file on the middle-tier server for the source system. Specify the value of the `user` attribute of the resource with name `sas/jdbc/DecisionManagerDS`. 
   - **source_db_name** specifies the database name from which you are migrating content.
   - **target_port** specifies the port number of the target database.
   - **target_host** specifies the host name of the target database.
   - **target_user** specifies the user ID for the target database.
   - **target_db_name** specifies the database name for the target database.
   - **target_exists** specifies whether the target database already exists.

   **Post-migration Steps**

   35
source_db_name
specifies the name of the database from which you are migrating content. You can find the correct value for this parameter in the /SAS-configuration-directory/LevWeb/WebAppServer/SASServer7_1/conf/server.xml file on the middle-tier server for the source system. If you are migrating from SAS Business Rules Manager 2.1, find the resource with the name sas/jdbc/dcmSharedDataSource. If you are migrating from SAS Business Rules Manager 2.2 or later, find the resource with the name sas/jdbc/DecisionManagerDS. Look for the value of the url attribute. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is url="jdbc:postgresql://host:10482/dcmdb", then specify dcmdb for source_db_name.

target_port
specifies the port number of the database to which you are migrating the content.

target_host
specifies the host name of the database to which you are migrating the content.

target_admin
specifies the user ID of the database administrator for the database to which you are migrating the content. This user ID is used to clean the target database and prepare it for the migrated content.

target_user
specifies a database user ID for the database to which you are migrating the content. This user ID is assigned ownership of the migrated content.

target_db_name
specifies the database name of the database to which you are migrating the content. The default target database name is dcmdb.

target_exists
specifies whether the target database exists. The default value is YES. If you have attempted to run this migration script but the migration failed, specify NO. Normally, the script creates a backup of the source database. If you specify NO, the script does not create an additional backup.

Note: This parameter is optional.
About the Upgrade Process

You can upgrade from SAS Business Rules Manager 2.1 or 2.2 to SAS Business Rules Manager 3.2.

Note: Beginning with SAS Business Rules Manager 3.1, SAS Business Rules Manager is integrated with SAS Lineage. If you are upgrading from SAS Business Rules Manager 3.1 to 3.2, only one pass of the SAS Deployment Wizard is needed. If you are upgrading from SAS Business Rules Manager 2.1 or 2.2 to 3.2, two passes of the SAS Deployment Wizard installation and configuration process are required in order to complete the upgrade. During the first pass of the SAS Deployment Wizard, your existing deployment is upgraded. After the upgrade has completed successfully, you must run the SAS Deployment Wizard again to install the new product components and to complete the configuration.

The SAS Business Rules Manager upgrade process supports upgrading to a database from the same vendor as the database that you are currently using. Upgrading from a database based on Oracle to a database based on PostgreSQL, or vice versa, is not supported.

If you are using Oracle for your SAS Decision Manager database, the upgrade process assumes that the upgraded environment uses the same instance of Oracle. The upgrade process does not support moving to a different Oracle database server.
Pre-upgrade Steps

Before you upgrade to SAS Business Rules Manager 3.2, record the database settings in your current environment. You must enter this information in SAS Deployment Wizard.

- If you are upgrading from SAS Business Rules Manager 2.1 and you are using the SAS Web Infrastructure Platform Data Server for your database, record the database name and the user ID for the database. The default database name is\textit{brmdb}.

  You can find the database name in the \texttt{SASCONFIG/Web/WebAppServer/SASServer7_1/conf/server.xml} file on the middle-tier server. Find the resource with the name \texttt{sas/jdbc/dcmSharedDataSource}, and look for the value of the \texttt{url} attribute. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is \texttt{url="jdbc:postgresql://host:10482/brmdb"}, then the database name is \textit{brmdb}.

- If you are upgrading from SAS Business Rules Manager 2.2 or 3.1, record the database name and the user ID for your SAS Decision Manager Common Data Server database. The default database name is\textit{dcmdb}.

  You can find the database name in the \texttt{SASCONFIG/Web/WebAppServer/SASServer7_1/conf/server.xml} file on the middle-tier server. Find the resource with the name \texttt{sas/jdbc/DecisionManagerDS}, and look for the value of the \texttt{url} attribute. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is \texttt{url="jdbc:postgresql://host:10482/dcmdb"}, then the database name is \textit{dcmdb}.

- If you are using Oracle for your database, ensure that the Oracle client is installed on your server tier and that there is a matching \texttt{tnsnames.ora} file that corresponds to your database. Record the information in the following table.

  You enter this information in the SAS Decision Manager Database Properties and SAS Decision Manager Database JDBC Properties windows.

\begin{table}[h]
\centering
\caption{SAS Deployment Wizard Information for Oracle}
\begin{tabular}{|l|p{0.8\textwidth}|}
\hline
\textbf{Prompt} & \textbf{Description} \\
\hline
Host Name & Specifies the fully qualified host name of the server on which the database is installed. \\
\hline
Port & Specifies the port number that is used by the database. The default port for Oracle is 1521. \\
\hline
Directory containing JDBC driver jars & Specifies the location of the database vendor’s JDBC JAR file. This file must be available on the middle tier and on any machine on which you are deploying SAS Business Rules Manager in order to configure SAS Decision Manager database. \\
& See “Verify JDBC Drivers for Oracle” on page 11 for more information. \\
\hline
\end{tabular}
\end{table}
### Database SID or Service Name
Specifications the Oracle database name. The database name must match either the service name or the Oracle site identifier (SID), both of which can be found in the tnsnames.ora file. For example:

```
(CONNECT_DATA = (SERVICE_NAME = mydb))
```

```
(CONNECT_DATA = (SID = mydb))
```

You can also find the Oracle SID by running the following query using a database user ID on your Oracle instance:

```
select instance from v$thread
```

**Note:** If you select **Use Oracle database name as a Service Name**, then you must enter the service name that is specified in the tnsnames.ora file.

### User ID
Specifies the user ID of the database user whose credentials are used to access SAS Business Rules Manager data on the server.

### Password
Specifies the password of the user ID whose credentials are used to access SAS Business Rules Manager data on the server.

### Schema Pattern
Specifies the schema name for the database. The default schema name is the same as the user ID.

---

**Upgrade Steps for SAS Business Rules Manager**

To determine the required steps to upgrade to the latest version of SAS Business Rules Manager, see the upgrade instructions in *SAS Guide to Software Updates* at [http://support.sas.com/documentation/whatsnew/index.html#wn94](http://support.sas.com/documentation/whatsnew/index.html#wn94).

Follow the instructions provided in “Add SAS Products That Require Configuration” in *SAS Intelligence Platform: Installation and Configuration Guide* to complete the installation and configuration process for an upgrade.

When you run the SAS Deployment Wizard the second time, complete these steps:

1. Verify that your plan file contains SAS Decision Manager Common products.

2. Verify that you are using the new SAS installation data (SID) file. The SID file for your software (your order) is located in the `sid_files` directory at the root of your SAS Software Depot or, if you have received media, on the first disk of that installation media.

3. In the list of products to be installed, do not change the selections. If there are no product changes, then the deployment wizard does not re-install any pre-existing products.

   When you run the SAS Deployment Wizard the second time, the SAS Lineage Mid-Tier is installed.

**Note:** In a multi-machine environment, the server products are typically installed on the SAS Application Server. The rest of the products are on the SAS Middle-Tier Server.
Note: If you are configuring multiple Web Application servers, SAS\textit{Server13} is added to the deployment for the additional products, so be aware of the need for additional ports.

4. Before the configuration stage begins, make sure that the following SAS Services are started:
   - SAS Metadata Server
   - SAS Web Infrastructure Platform Data Server
   - SAS Decision Manager Common Data Server (if you are not using Oracle for your database)
   - SAS Web Server (httpd - WebServer)
   - SAS Object Spawner
   - SAS JMS Broker
   - SAS Cache Locator

5. Verify that the following products are selected for configuration:

<table>
<thead>
<tr>
<th>Product</th>
<th>Upgrading from Version 2.1</th>
<th>Upgrading from Version 2.2 or Later</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Decision Manager Common Data Server</td>
<td>Yes</td>
<td>not applicable</td>
</tr>
<tr>
<td>SAS Web Application Server Configuration</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SAS Lineage Mid-Tier</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SAS Help Viewer for Mid-Tier Applications</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SAS Decision Manager Common Mid-Tier for Decision Manager</td>
<td>Yes</td>
<td>not applicable</td>
</tr>
<tr>
<td>SAS Business Rules Manager Web Mid-Tier</td>
<td>Yes</td>
<td>not applicable</td>
</tr>
</tbody>
</table>

**Post-upgrade Steps**

1. After you complete the upgrade process with the SAS Deployment Wizard, see the Instructions.html file. The Instructions.html file is located in \SAS-configuration-directory\Lev\Documents\Lev\Documents. The default URL is http://host_name:port/SASDecisionManager.

2. If you are upgrading from SAS Business Rules Manager 2.1 to 3.2 and you are using the SAS Decision Manager Common Data Server for your database, use SAS Deployment Manager to remove the existing configuration for both Decision Manager Common Mid-Tier and Business Rules Web Manager Mid-tier. See “Removing a SAS Configuration” in SAS Intelligence Platform: Installation and Configuration Guide for more information.

Note: Do not remove the configurations if you are using Oracle for your database.
3. If you are upgrading from SAS Business Rules Manager 2.1 to 3.2 and you are using the SAS Decision Manager Common Data Server for your database, run the SAS Deployment Wizard a second time to reconfigure both Decision Manager Common Mid-tier and Business Rules Web Manager Mid-Tier.

   Note: Do not reconfigure these products if you are using Oracle.

4. If you are upgrading from SAS Business Rules Manager 2.1 and you are using the SAS Decision Manager Common Data Server, run the database migration script for your operating system. See “Migrate to Version 3.2 for SAS Decision Manager Common Data Server” on page 35 for more information. (You do not need to run a migration script if you are using Oracle or if you are upgrading from SAS Business Rules Manager 2.2 or later.)

5. (Optional) Configure your deployment to use HTTPS. See “Configure Your Deployment for HTTPS” on page 24 for more information.

6. Update your user group memberships, authorization, roles, and capabilities as needed. See “Updating Groups and Roles for SAS Business Rules Manager 3.2” on page 51 for more information.

7. (Optional) Add the Visual Analytics: Data Building and Data Management: Lineage roles to the Decision Manager Users group. See “Administering Group and Role Membership” on page 48 for more information. These roles enable users to run SAS Visual Data Builder and view lineage information for rule flows.

8. Review the configuration properties in SAS Management Console. Ensure that the values are appropriate for the new environment. See “Review Application Properties in SAS Management Console” on page 25 for more information.

9. (Optional) If you are upgrading from SAS Business Rules Manager 2.1 and are using SAS Workflow, perform the post-installation configuration and verification steps for SAS Workflow. For more information, see “Configuring SAS Workflow for Use with SAS Business Rules Manager” on page 57.

Security Administration Tasks for SAS Business Rules Manager

Security administration for SAS Business Rules Manager consists of the following tasks:

• administering SAS identities for your users by adding account information to the SAS Metadata Server
• administering groups of users in order to simplify the management of roles
• administering roles, which provide users with access to specific application features

The information included here is a brief introduction to the concepts of users, SAS identities, groups, roles, and capabilities. For complete information about security administration, see *SAS Management Console: Guide to Users and Permissions* and *SAS Intelligence Platform: Security Administration Guide*. 
Administering SAS Identities for Users

Overview of SAS Identities

For each SAS Business Rules Manager user, you must create an individual SAS identity on the SAS Metadata Server. The SAS identity is a copy of the ID with which the user logs on to SAS applications. Based on this identity, the system can determine who can access which application and can audit individual actions in the metadata layer. The SAS identity consists of a name, user ID, and password for the user’s external account. This ID can be any type of account that is known to the metadata server’s host, such as an LDAP account, Active Directory account, host account, or other type of account.

When you are entering user IDs for Windows accounts, be sure to qualify the ID (for example, WIN\myID or myID@mycompany.com).

In a Windows environment, add new users to the Log on as a batch job local security policy on the machine that hosts the SAS Workspace Server.

Note: Users who log on to SAS Business Rules Manager using an internal account (a user ID that ends in @saspw) cannot access all of the features of the application. All users should be assigned external accounts.

The following users are created as part of the SAS Business Rules Manager installation process:

<table>
<thead>
<tr>
<th>User</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS Administrator</td>
<td>This user has access to all SAS Management Console capabilities and metadata administrative tasks.</td>
</tr>
<tr>
<td>SAS Demo User</td>
<td>This user is optional. You can choose to create this user during installation. However, this user is not assigned to a group during installation.</td>
</tr>
</tbody>
</table>

Creating SAS Identities

To create SAS identities for your users, manually enter the information for each user through the User Manager plug-in in SAS Management Console. If you have a large number of users, then you can extract user and group information from one or more enterprise identity sources. You can then use SAS bulk-load macros to create the identity metadata from the extracted information.

For more information about creating and managing identities, see SAS Management Console: Guide to Users and Permissions. For information about the SAS bulk-load macros, see “” in SAS Intelligence Platform: Security Administration Guide.
Groups and Group Membership

About Groups

A group is a set of users. Groups enable you to grant multiple users membership in a role or permissions to metadata, thus simplifying security administration. You can create as many groups as are needed in order to manage your installation.

A group’s membership can include other groups as well as individual users. This enables you to create a nested group structure.

Predefined User Groups in SAS Business Rules Manager

Table 7.2  Predefined User Groups

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public</td>
<td>This group includes everyone who can access the metadata server, either directly or through a trust relationship. If a user is able to log on to a client application but does not have an individual SAS identity, the user is assumed to be in the public group. Because this group has implicit membership, you cannot explicitly add or remove users from this group.</td>
</tr>
<tr>
<td>SAS Users</td>
<td>This group includes everyone who can access the metadata server, either directly or through a trust relationship. If a user is able to log on to a client application but does not have an individual SAS identity, the user is assumed to be in the public group. Because this group has implicit membership, you cannot explicitly add or remove users from this group.</td>
</tr>
<tr>
<td>SAS Administrators</td>
<td>This is a standard group for metadata administrators. In a standard configuration, members are granted broad access and administrative capabilities, but are not unrestricted.</td>
</tr>
<tr>
<td>Decision Manager Common</td>
<td>This group has administrative permissions. Membership in this group is required to administer workflows. In your initial installation, this group is a member of the following roles:</td>
</tr>
<tr>
<td>Administrators</td>
<td>• Decision Manager Common: Administration</td>
</tr>
<tr>
<td></td>
<td>• Business Rules Manager: All Capabilities</td>
</tr>
</tbody>
</table>

In your initial installation, this group is a member of the following roles:

• Decision Manager Common: Administration
• Business Rules Manager: All Capabilities
Groups and Roles

**Group**  
**Description**

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
</table>
| Decision Manager Users | This group is created during the installation process. Members of this group have permission to read, add, or delete table summary information in the Data category. During configuration, this group was associated with an identity that enables members to access the database during rule flow and table summary execution.  
  **Note:** This group is the only group that is granted permission to publish business rules content to the SAS Content Server by default.  
  **Note:** Unless you make configuration changes, users who do not have administrator permission must be members of this group. If you want these users to be members of a different group, you must grant the group permissions that enable members to do the following:  
  - access the database (using the necessary identity)  
  - publish content to the folders for SAS Business Rules Manager on the SAS Content Server |

### Roles and Capabilities

**About Roles and Capabilities**

A role manages the availability of application features such as menu items and plug-ins. An application feature that is under role-based management is called a capability.

Certain actions are available only to users or groups that have a particular role. Any user or group who is a member of a role has all of that role’s capabilities.

Roles can contribute to one another. A role automatically includes all of the capabilities of a role that contributes to it.

Roles differ from permissions. In general, roles do not affect access to metadata or data.

**Predefined Roles and Capabilities for SAS Business Rules Manager**

Your installation includes several predefined roles for administrators and users of SAS Business Rules Manager. Depending on what software you have installed, you might have other predefined roles.

**Note:** The ability to access and update metadata is subject to permissions that are placed on that metadata. These roles do not affect permissions.
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision Manager Common: Administration</td>
<td>Enables users to perform all Decision Manager Common tasks, including administering workflows. This role is assigned to the group Decision Manager Common Administrators and has the Decision Manager Common: Workflow category capability.</td>
</tr>
<tr>
<td>Business Rules Manager: All Capabilities</td>
<td>Enables users to create, edit, and delete all business rules content, including vocabularies, entities, terms, lookup tables, rule sets, and rule flows.</td>
</tr>
<tr>
<td>Business Rules Manager: Rule Flow and Rule Set Designer</td>
<td>Enables users to create, edit, and delete rule sets and rule flows.</td>
</tr>
<tr>
<td>Business Rules Manager: Rule Flow and Rule Set Read-Only</td>
<td>Enables users to view rule sets and rule flows.</td>
</tr>
<tr>
<td>Business Rules Manager: Vocabulary and Lookup Designer</td>
<td>Enables users to create, edit, and delete vocabularies, entities, terms, and lookup tables.</td>
</tr>
<tr>
<td>Business Rules Manager: Vocabulary and Lookup Read-Only</td>
<td>Enables users to view vocabularies, entities, terms, and lookup tables.</td>
</tr>
<tr>
<td>Comments: Administrator</td>
<td>Enables users to edit or delete comments. The ability to edit and delete comments is controlled by the capabilities under Applications ⇒ SAS Application Infrastructure ⇒ Comments in SAS Management Console.</td>
</tr>
<tr>
<td>Data Management: Lineage</td>
<td>Provides default access to the SAS Lineage application. This role is predefined, but it is not automatically added to the Decision Manager Users group. To enable SAS Business Rules Manager users to access SAS Lineage, add the Data Management: Lineage role to the Decision Manager Users group. See “Adjust Group or Role Membership” in SAS Management Console: Guide to Users and Permissions for instructions.</td>
</tr>
</tbody>
</table>
**Administering Group and Role Membership**

To administer group and role membership, use the User Manager plug-in in SAS Management Console.

**Viewing Roles and Capabilities in SAS Management Console**

To view details about a role, open the User Manager plug-in in SAS Management Console, right-click the role, and select **Properties**. You can then view tabs that display the role’s members, capabilities, and contributing roles.

For example, the following display shows the capabilities for the Business Rules Manager: Rule Flow and Rule Set Designer role. These capabilities correspond to the
Some roles have implicit capabilities, see the description on the General tab.

Note: The preferred way to manage permissions for viewing vocabularies and lookup tables is by using capabilities under Vocabulary/Entity/Term and Lookup. The Manage Vocabulary/Lookup definitions capability is for compatibility with previous releases.

Note: Some roles have implicit capabilities that are not specified on the Capabilities tab.

The SAS Business Rules Manager capabilities control access to categories in the application. For example, the Rule Sets and Rule Flows categories do not appear when a user signs in to SAS Business Rules Manager if that user is not assigned to either of the following categories:

- Business Rules Manager: Rule Flow and Rule Set Designer
- Business Rules Manager: Rule Flow and Rule Set Read-Only

The Create/Update and Delete capabilities control access to specific object types. You can combine the category capabilities with the object capabilities to control access at
whatever level is needed. For example, if you want a user to be able to view and edit rule flows only, the user should have only the following capabilities:

- Manage Business Rule Flows/Sets for the Business Rules Plugin
- Create/Update and Delete capabilities for Rule Flow objects

The following table describes the icons used in the Properties window.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon]</td>
<td>None of the capabilities in this category have been specified for this role.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Some of the capabilities in this category have been specified for this role, either explicitly or through a contributing role.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>All of the capabilities in this category have been specified for this role, either explicitly or through a contributing role.</td>
</tr>
</tbody>
</table>

Shaded check boxes indicate capabilities that come from contributing roles.

**Adding a User to a Group or Role**

In most cases, the best way to place a user in a role is to add the user to a group that belongs to the role. You can also add users directly to groups or roles.

To place a user in one of the predefined roles, you can add the user to one of the predefined groups. For example, to add a user to the Decision Manager Common: Administration role, add the user to the Decision Manager Common Administrators group.

For more information, see *SAS Management Console: Guide to Users and Permissions*.

**Creating New Groups and Roles**

The predefined groups and roles might be sufficient for many sites. Other sites might need to make application features available to users on either a broader or more granular basis than the predefined groups or roles allow.

You can use combinations of capabilities to create a new role. However, you can use only the capabilities that already appear in User Manager. You cannot create new capabilities.

For detailed information about roles and how to create them, see *SAS Management Console: Guide to Users and Permissions*.

**Modifying Roles**

The User Manager plug-in in SAS Management Console enables you to modify roles by selecting or deselecting different capabilities.

**CAUTION:**

No automated method can revert a role to its original set of capabilities. Instead of adjusting the capabilities of a predefined role, consider creating a new role. This advice is especially important if you need to make major changes.

If you modify a role, then follow these best practices:
• Do not rename the predefined roles. Renaming the predefined roles makes it difficult for SAS Technical Support to help you resolve problems.

• Keep a record of the changes that you make.

When modifying a role, you can use only the capabilities that already appear in User Manager. You cannot create new capabilities.

For more information about roles and how to modify them, see SAS Management Console: Guide to Users and Permissions.

---

**Updating Groups and Roles for SAS Business Rules Manager 3.2**

When you perform a migration or an upgrade, the groups, roles, and capabilities defined in SAS Management Console are preserved in case they have been customized for your site. To take advantage of new roles and capabilities available in SAS Business Rules Manager, you might need to modify the settings in SAS Management Console.

**Enable Business Rules Folder Administration**

*Note:* This information applies to all new installations, upgrades, and migrations. Enabling folder administration is optional.

A business rules folder administrator specifies which groups have permission to create and update top-level business rules folders and to modify the location of tests and test data for those folders. See “Create New Top-Level Folders” in SAS Business Rules Manager: User’s Guide for more information.

*Note:* After you enable folder administration, you must assign a group to any pre-existing folders. Any folder that has not been assigned a group is visible only to folder administrators.

Follow these steps in SAS Management Console:

1. Set the `brm.folder.config.enabled` property to `true`. See “Review Application Properties in SAS Management Console” on page 25 for more information.

   *Note:* Setting `brm.folder.config.enabled` to `true` disables the ability to import and export business rules content. Business rules content includes business rules folders, vocabularies, terms, lookup tables, rule sets, and rule flows. You can override this restriction by setting `brm.import.restriction.override` to `true`.

2. Click the User Manager plug-in.

4. On the `General` tab, enter a name for the administrator role.

5. On the `Capabilities` tab, select `Business Rules Manager Web 3.2 ⇒ Administration ⇒ Folder Administration`. 

---
6. On the **Members** tab, add the necessary identities to the role.

7. Click **OK**.

**Update User Group Membership and Authorization**

*Note:* This section applies only if you are upgrading or migrating from SAS Business Rules Manager 2.1 to 3.2.

In SAS Business Rules Manager 2.1, all users that needed access to the SAS Business Rules Manager database were assigned to the Business Rules Manager Users group. Beginning with SAS Business Rules Manager 2.2, users are assigned to the Decision Manager Users group. If you migrate or upgrade from SAS Business Rules Manager 2.1 to SAS Business Rules Manager 3.2, you might need to update the membership or authorization for the Business Rules Manager and Decision Manager User groups.

You can continue to use the Business Rules Manager Users group as your primary group, or you can start using the Decision Manager Users group. If you continue to use the Business Rules Manager Users group, you can preserve customized authorization settings.

To use the Decision Manager Users group as your primary group, in SAS Management Console, assign all users that need access to SAS Business Rules Manager to the Decision Manager Users group.

To continue to use the Business Rules Manager Users group:

1. Ensure that all users that need access to the SAS Business Rules Manager database are assigned to the Business Rules Manager Users group.

2. If you are using a different database instance in the migrated environment, update the authentication domains for migrated user groups. Complete the following steps in SAS Management Console:

   a. Remove the identity for the authentication domain `edm_db_auth` from the Decision Manager Users group.

      i. Select the **User Manager** plug-in.

      ii. Right-click **Decision Manager Users** and select **Properties**.

      iii. Click the **Accounts** tab. Record the user ID that is specified for the `edm_db_auth` authentication domain. This user ID is the user ID that you need to add to the Business Rules Manager Users group.

      iv. Select the row for `edm_db_auth` and click **Delete**.

      v. Click **OK**.
b. Update the identity for the authentication domain `edm_db_auth` for the Business Rules Manager Users group to match the updated login that was added to the Decision Manager Users group.

   i. Select the User Manager plug-in.
   ii. Right-click Business Rules Manager Users and select Properties.
   iii. Click the Accounts tab, and click New. The New Login Properties dialog box appears.
   iv. Enter the user ID that you recorded for the `edm_db_auth` domain and the password for this user ID. Select the `edm_db_auth` domain, and click OK.
   v. Click OK to save the changes to the Business Rules Manager Users group.

**Update Administrator Groups and Roles**

*Note:* This information applies only if you are upgrading from SAS Decision Manager 2.1 to 3.2.

SAS Decision Manager 2.1 created the Decision Manager Common Administrator group and the Decision Manager Common: Administrator role. When you upgrade from SAS Decision Manager 2.1 to 3.2, the second pass of the SAS Deployment Wizard creates a new group named Decision Manager Common Administrators and a new role named Decision Manager Common: Administration.

Follow these steps in SAS Management Console:

1. Add the members of the Decision Manager Common Administrator group to the Decision Manager Common Administrators group.
2. Add the members of the Decision Manager Common Administrators role to the Decision Manager Common: Administration role.
3. Delete the old Decision Manager Common Administrator group and the old Decision Manager Common Administrators role.

See “Adjust Group or Role Membership” in *SAS Management Console: Guide to Users and Permissions* for more information.

**Configure the Ability to Import and Export Content**

SAS Business Rules Manager provides several macros for importing and exporting business rules content from the Decision Manager database. (Business rules content includes business rules folders, vocabularies, terms, lookup tables, rule sets, and rule flows.) You can limit the ability of users to run these macros by setting the correct properties and configuring identities in SAS Management Console. For more information about the macros, see “Macros Available with SAS Business Rules Manager” on page 66.

**Control Access to the Import and Export Macros**

Perform the following steps in SAS Management Console:

1. Set the `brm.import.restriction.override` property to `true` if the `brm.folder.config.enabled` property is also set to `true`.

   *Note:* Setting `brm.folder.config.enabled` to `true` disables the ability to import and export business rules content. To override this restriction, set
2. Create a new group for users with full access. For example, create a new group named **Business Rules Admin Users**.

3. Add the new group as a member of the existing Decision Manager Users group. Members of the new group have the same access as members of the Decision Manager Users group. This access includes the ability to run the import and export macros and to update content through the user interface.

4. Create a second new group for users with limited access. For example, create a new group named **Business Rules NonAdmin Users**. Members of this group will be able to update content through the user interface but will not be able to run the import or export macros.

5. Create a runtime database user that has Read access to lookup tables only. This permission is the only one that is required to be able to run rules in SAS Business Rules Manager and in SAS Data Integration Studio. Follow the instructions for your database:
   - “Create a Runtime User for SAS Decision Manager Common Data Server” on page 54
   - “Create a Runtime User for Oracle” on page 55

6. Add a new login for the runtime user to the second new group (**Business Rules NonAdmin Users**). Specify the user ID and password that were created in the previous step, and select the authentication domain **edm_db_auth**.

7. Add any additional roles or capabilities that are needed by members of the new group.

**Create a Runtime User for SAS Decision Manager Common Data Server**

Run the `createRuntimeUser` script for your operating environment. This script creates an identity that has Read permission only for lookup tables.

The script for Windows platforms is named `createRuntimeUser.bat`, and the script for UNIX platforms is named `createRuntimeUser.sh`. They are located in the following directory:

```
SASHome/SASDecisionManagerCommonDataServer/3.2/Config/Deployment/createUser
```

*Note:* This directory contains a README.TXT file that contains information about the parameters for these scripts.

When you run the script, substitute the correct values for the port number, host name, and user ID for your database. The script prompts you to enter a password. The syntax for these scripts is as follows:

```
createRuntimeUser.[bat | sh] SASHome port host admin db_name user_ID
```
SASHome
specifies the SAS Home installation directory location. In Windows operating environments, it is recommended that you enclose this parameter in double quotation marks.

port
specifies the port number of your database.

host
specifies the host name of the database.

admin
specifies the user ID of the database administrator for the database. This user ID must have access to all of the database content. You can find the correct value for this parameter in SAS Management Console. In SAS Management Console, select the User Manager plug-in. Right-click the SAS Administrator user, and select Properties. The user ID of the database administrator is the user ID for the DecisionManagerComDataSvrCfg3.2Admin domain.

db_name
specifies the name of the database. You can find the correct value for this parameter in the SASCONFIG/Web/WebAppServer/SASServer7_1/conf/server.xml file on the middle-tier server. The database name is the text after the final forward slash (/) in the URL. For example, if the attribute is url="jdbc:postgresql://host:10482/dcmdb", then specify dcmdb for db_name.

user_ID
specifies a user ID for the new identity that will have Read permission only for lookup tables.

Create a Runtime User for Oracle
Ask your Oracle database administrator to perform the following tasks:

1. Create a new user and schema in Oracle and provide you with the new user ID and password.
2. Grant SELECT access to the following views for the new user in the SAS Business Rules Manager database.
   - DCM_LOOKUP_VIEW
   - DCM_SELECTED_LOOKUP_VIEW
3. Create synonyms in the new user’s default schema so that they can execute queries with unqualified references to those views.

```
CREATE SYNONYM DCM_LOOKUP_VIEW FOR @brm.schema.name@.DCM_LOOKUP_VIEW;
CREATE SYNONYM DCM_SELECTED_LOOKUP_VIEW FOR @brm.schema.name@.DCM_SELECTED_LOOKUP_VIEW;
```
Chapter 8
Configuring SAS Workflow

Configuring SAS Workflow for Use with SAS Business Rules Manager

Overview
SAS Workflow provides services that work together to model, automate, integrate, and streamline business processes. It provides a platform for more efficient and productive business solutions.

SAS Workflow is used by SAS solutions that benefit from business process management. SAS Workflow Studio is a desktop client application that is used to design and deploy workflow definitions. The SAS middle tier hosts the workflow engine and the workflow services as part of the SAS Web Infrastructure Platform. SAS Business Rules Manager is used to manage the workflows that are associated with versions. For more information about SAS Workflow, see “SAS Workflow” in SAS Intelligence Platform: Middle-Tier Administration Guide.

Prerequisites for Using SAS Workflow
To use SAS Workflow with SAS Business Rules Manager, be sure the following prerequisites are met:

1. SAS Workflow Engine, SAS Workflow Services, and SAS Workflow Studio must be installed and configured. For more information, see SAS Intelligence Platform: Installation and Configuration Guide.
2. If you want to receive notifications for a workflow, you must configure alert notifications using SAS Management Console. For more information, see “Configure Alert Notifications for SAS Workflow” on page 61.

3. The Workflows category capability (under Decision Manager 3.2 Decision Manager Common) must be selected for the Decision Manager Common: Administration role. See “Administering Group and Role Membership” on page 48 for more information.

4. Users must be a member of the Decision Manager Common Administrators Group or of another user group that is associated with the Decision Manager Common: Administration role.

5. In SAS Web Administration Console, the users or groups must be assigned to a workflow template management role. For more information, see Deploying and Maintaining Workflows in SAS Workflow Studio: User’s Guide.

6. Workflow definitions must be created using SAS Workflow Studio. For more information about creating workflow definitions, see Defining Workflows with SAS Workflow Studio in SAS Workflow Studio: User’s Guide.

Guidelines for Creating Workflow Definitions

When you create workflow definitions in SAS Workflow Studio to use with SAS Business Rules Manager, follow these guidelines:

- Participants, and policies must be added to the task level. Statuses added at the task level and the default statuses at the workflow definition level can be used for a task status. Data objects can be added at the workflow definition level or task level. Users can see only the data objects defined at the task level from the Workflows category in SAS Business Rules Manager.

- Only the Potential Owner and Business Administrator workflow roles are used by SAS Business Rules Manager and they can be used in either a participant or swimlane definition. The Actual Owner workflow role should not be used as part of a workflow definition.

- In order to assign additional participants to tasks in SAS Business Rules Manager, the user must have or be in a group that is assigned the workflow role of Business Administrator. Also, in order to manage workflows and assign participants, the user must be in the Decision Manager Common Administrators group, or in a group that is a member of the Decision Manager Common Administrators group or that is associated with the Decision Manager Common: Administration role in SAS Management Console.

The following groups are created at installation time:

- Decision Manager Common Administrators Group
- Decision Manager Users Group

For more information, see “Security Administration Tasks for SAS Business Rules Manager” on page 43.

- Only workflow definitions that are activated in the Workflow repository, that are associated with the mmapi tag attribute in the file properties, are available to SAS Business Rules Manager.
Add the Approval Attribute to a Status

The Approval attribute allows a workflow designer to signify that a specific task approves the associated version for a rule flow. This attribute then notifies the users of the version that a rule flow is approved. For business rules the Approval attribute must be set so that a workflow can be used to manage rule flows.

To add the Approval attribute to a status:

1. Expand the Statuses folder in the Workflow Tree.
2. Right-click a status and select Edit.
3. Click Attributes.
4. Click Add and enter the following values for the new attribute.
   - **Key**: Approval
     - Note: This key is case-sensitive.
   - **Value**: true
5. Click OK twice to save.

Make Workflow Definitions Available to SAS Business Rules Manager

After you have created a workflow definition in the SAS Workflow Studio, you must make the workflow definition available to SAS Business Rules Manager.

To save the workflow definition to the Workflow repository:

1. Save the workflow definition to your local drive.
2. Log on to the server.
3. Add the tag attribute of mmapi to the workflow definition file properties.
4. Upload the workflow definition.
5. Verify that the workflow definition is available in the Workflows category.
For more information, see Deploying and Maintaining Workflows in SAS Workflow Studio: User’s Guide.

**Log On to the Server**

With SAS Workflow Studio, you are limited to managing locally stored workflow definitions on your system until you have logged on to the SAS Content Server. After you are connected, you can access additional workflow definitions that are stored in the SAS Content Server.

To log on to the server:

1. Select **Server ➔ Log On**.
2. In the Log On window, select the host-name from the **SAS environment** drop-down list.
   
   **Note:** For more information, see “Configuring the SAS Environment File” in SAS Intelligence Platform: Middle-Tier Administration Guide.
3. Enter a user ID and password, and click **Log On**.
4. Click **OK** if a confirmation message appears.

**Add Tag Attributes to a Workflow Definition**

Only those workflow definitions in the Workflow repository that contain the `mmapi` tag attribute in the file properties are available to SAS Business Rules Manager.

To add a tag attribute to the file properties of a workflow template in SAS Workflow Studio:

1. Select **File ➔ Properties** and click **Add**.
2. Enter the tag value of `mmapi`.
   
   **Note:** The file properties are case sensitive. This value must be lowercase.
3. Click **OK** twice.

**Upload a Workflow Definition**

To upload a workflow:

1. From the **Server** menu, select the **Save to Repository** menu option. The Save to Workflow Repository window appears.
2. (Optional) Enter relevant comments to associate with the workflow definition.
3. Select the **Activate** option if you want to activate the current version in the Workflow repository.
4. Click **OK**.
5. Click **OK** if confirmation messages appear.
Verify That the Workflow Definitions Are Available In SAS Business Rules Manager

To verify that the workflow definitions are available in the Workflows category view of SAS Business Rules Manager:

1. Enter the URL `http://hostname:port/SASDecisionManager` in your web browser.
2. Enter the user ID and password for a user that is in the Decision Manager Common Administrators Group or a user group that is associated with the Decision Manager Common: Administration role.
3. Verify that the uploaded workflow definition is available in the Workflows category view. From the Workflows category view, select **Actions** ➔ **Set Mappings**. The Set Mappings window appears with a list of the available workflow definitions.

For more information, see “Set Mappings” in *SAS Business Rules Manager: User’s Guide*.

Configure Alert Notifications for SAS Workflow

To enable workflow participants to receive alert notifications from SAS Workflow, you must configure the **E-mail** notification type in SAS Management Console. After you have configured the alert notifications, you can then use the Notify Participant policy and other workflow notification policies for workflow tasks in SAS Workflow Studio. The notifications setting in SAS Management Console is a global setting. Preferences and notifications can also be configured for individual users.

The Send Notification By Data Object policy in SAS Workflow Studio integrates with the SAS Web Infrastructure Platform's Notification Service. Recipients are notified according to their preferences (e-mail or portlets).

1. Log on to SAS Management Console as an administrator.
2. On the **Plug-ins** tab, navigate to **Application Management** ➔ **Configuration Manager** ➔ **SAS Application Infrastructure**.
3. Right-click **SAS Application Infrastructure** and select **Properties**.
4. Click the **Settings** tab.
5. Select **Notifications** in the left panel. Use the menus or text fields to set the property.
6. Select the **E-mail** notification type.
7. Click **OK**.
8. To apply this setting and make it available, restart the SAS Web Infrastructure Platform Services, SAS Shared Services, and applications using SAS Workflow.

For more information about the notification properties, see “Setting Global Properties for SAS Applications” in *SAS Intelligence Platform: Middle-Tier Administration Guide*. For more information about setting the notification policies for SAS Workflow, see the SAS Workflow Studio Help or *SAS Workflow Studio: User’s Guide*. 
Part 3

Macro Reference

Chapter 9
Macros Available with SAS Business Rules Manager ............ 65
Requirements and Tips for Using SAS Business Rules Manager Macros

The SAS Business Rules Manager macros must be run on the server tier.

If your SAS environment is in the locked-down state, your access to the file system of the host operating environment might be restricted. In order to run the SAS Business Rules Manager macros, your system administrator must enable the HTTP access method by specifying ENABLE_ AMS=HTTP on the LOCKDOWN statement. For more information, see “Locked-Down Servers” in SAS Intelligence Platform: Security Administration Guide and “LOCKDOWN Statement” in SAS Intelligence Platform: Application Server Administration Guide.

If folder administration is enabled, your system administrator must set brm.import.restriction.override to true in SAS Management Console in order for you to be able to use the import macros. For more information, see “Enable Business Rules Folder Administration” on page 51 and “Business Rules Manager Web Advanced Properties” on page 26.
• If the value of a macro option contains a space, comma, forward slash (/), or other special characters, escape these characters by using a macro function such as the %STR function. For example, specify a full path name as %STR(/Users/user_ID/My Folder) or a set of rule flow identification numbers as %STR(10168,10043). For more information, see “%STR and %NRSTR Functions” in *SAS Macro Language: Reference*.

• You can modify data values in exported CSV files, and then re-import the data. However, do not modify the CSV file structure (column or row order) or the CSV header row.

**CAUTION:**

*If an input file contains errors, the database might become corrupted.*

Carefully review any changes you make to exported CSV files before you re-import the data.

• The same macro can be run simultaneously by multiple users. However, running import macros concurrently is not recommended.

---

**Macros Available with SAS Business Rules Manager**

SAS Business Rules Manager macros are categorized by their functionality. Each macro belongs to one of the following categories:

Create terms

Create and load new vocabulary terms into the SAS Decision Manager database.

Export

Export content from the SAS Decision Manager database.

Import

Import content into the SAS Decision Manager database.

Publish rule flows

Publish rule flows to the content server.

Run rule flows

Create DS2 package code for rule flows and run the rule flows.

<table>

<td>Creates (but does not compile) a DS2 package that contains the SAS code for a specific rule flow. You can run this rule flow package by using the %BRM_RULEFLOW macro.</td>
</tr>
<tr>
<td></td>
<td>%BRM_RULEFLOW (p. 87)</td>
<td>Runs rule flows. You can use the %BRM_RULEFLOW macro to run packages that were created with the %BRM_GET_RULEFLOW_CODE macro.</td>
</tr>
</tbody>
</table>

**Dictionary**

**%BRM_CREATE_TEMP_TERM**

Reads a CSV file or a SAS data set that defines vocabulary terms and produces a SAS data set named WORK.TERM. You can use the WORK.TERM data set as input to the %BRM_LOAD_VOCABULARY macro.
Category: Create terms

See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax

```sas
%BRM_CREATE_TEMP_TERM (DATAFILE=\input_file\, BRM_USER=\user_ID\);
```

**Required Argument**

**DATAFILE=\input_file**

specifies either a SAS data set name or the full path name to a CSV file.

If the input file is a CSV file, the first row of the file must contain valid SAS column names, and the remaining rows must contain column values. The column values can be only numeric or character data. You cannot specify SAS informats in the column data. The column names must be unique. For example, a simple CSV file that specifies two columns, both with numeric data, might look like the following:

```
patientID,BloodPressure
1,140
2,141
3,142
```

**Optional Argument**

**BRM_USER=\user_ID**

specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.

Default User ID of the user that is logged on to the server and running the macro

**Details**

This macro reads a CSV file or SAS data set that defines vocabulary terms and creates a SAS data set named WORK.TERM. You can use the WORK.TERM data set as input to the `%BRM_LOAD_VOCABULARY` macro. The `%BRM_LOAD_VOCABULARY` macro loads the vocabulary terms into the SAS Decision Manager database. See “%BRM_LOAD_VOCABULARY” on page 85 for more information.

The `%BRM_CREATE_TEMP_TERM` macro derives domain types and domain values for the vocabulary terms based on the data type of the term as described in Table 9.1.

**Table 9.1 Domain Types and Values for Input Terms**

<table>
<thead>
<tr>
<th>Term Data Type</th>
<th>Derived Domain Type</th>
<th>Derived Domain Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td>Discrete</td>
<td>If there are ten or fewer distinct values in the input data, all of the values are included in the list of domain values. If there are greater than ten distinct values in the input data, individual values are not listed in the domain values.</td>
</tr>
</tbody>
</table>
Term Data Type | Derived Domain Type | Derived Domain Values
---|---|---
Date | Continuous | No input values are included in the list of domain values.
Datetime | Continuous | No input values are included in the list of domain values.
Boolean | Boolean | True and False
Numeric | If there are ten or fewer distinct values in the input data, the domain type is Discrete. If there are greater than ten distinct values, the domain type is Continuous. | For Discrete domain types, all of the values in the input data are included in the list of domain values. For Continuous domain types, only the minimum and maximum values are included in the list of domain values.

%BRM_EXPORT_FOLDER

Exports either the definition of a single business rules folder or the definitions all business rule folders into a CSV file. You can modify the CSV file and use it as input to the %BRM_IMPORT_FOLDER macro.

Category: Export

See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax

%BRM_EXPORT_FOLDER (CSV=\output_filename.\CSV <, FOLDER_PATH=\path_name\>);

Required Argument

CSV=\output_filename

specifies the full path name to the CSV file for the exported data.

Optional Argument

FOLDER_PATH=\path_name

specifies the full path name of the business rules folder that you want to export. Use a forward slash to separate folder names. By default, %BRM_EXPORT_FOLDER exports all business rules folders. If you specify a folder path name, then only that folder is exported.

Example

folder_path=%STR(Retail/ApprovedLoans)
%BRM_EXPORT_LOOKUP

Exports the contents of lookup tables into a CSV file. You can modify the CSV file and use it as input to the %BRM_IMPORT_LOOKUP macro.

Category:  Export

See:  "Requirements and Tips for Using SAS Business Rules Manager Macros" on page 65

Syntax

%BRM_EXPORT_LOOKUP (CSV=\output_filename\.CSV<, optional-arguments>);  

Required Argument

CSV=\output_filename\n
specifies the full path name to the CSV file for the exported data.

Optional Arguments

FOLDER_PATH=\path_name\n
specifies the full path name to the business rules folder from which you want to export lookup tables. Use a forward slash to separate folder names.

If you specify a folder path name, then the lookup tables only in that folder are exported. For example, if you specify FOLDER_PATH=\Loans/Retail\, then the lookup tables only in the Loans/Retail folder are exported. If you specify both LOOKUP=CountryCodes,ZipCodes and FOLDER_PATH=\Loans/Retail\, but neither of the specified lookup tables are in the Loans/Retail folder, then no lookup tables are exported.

LOOKUP='\lookup_table_1\', '\lookup_table_2\', ...

specifies the names of the lookup tables that you want to export. Separate multiple names with commas.

By default, %BRM_EXPORT_LOOKUP exports all lookup tables. You do not need to specify the LOOKUP= option unless you want to export specific tables.

Example  lookup=\STR('BadVINSTates','StateCodes')

%BRM_EXPORT_RULE_FLOW

Exports rule flows from the SAS Decision Manager database into a CSV file. You can modify the CSV file and use it as input to the %BRM_IMPORT_RULE_FLOW macro.

Category:  Export

See:  "Requirements and Tips for Using SAS Business Rules Manager Macros" on page 65

Example  lookup=\STR('BadVINSTates','StateCodes')
%BRM_EXPORT_RULE_FLOW

Syntax

%BRM_EXPORT_RULE_FLOW (CSV=output_filename.CSV
RULEFLOWS=ALL | rule_flow_1<, rule_flow_2>...<, FOLDER_PATH=path_name>);

Required Arguments

CSV=output_filename

specifies the full path name to the CSV file for the exported data.

RULEFLOWS=ALL | rule_flow_1<, rule_flow_2>...

specifies the rule flows that you want to export. Specify ALL to export all rule flows. To export only selected rule flows, specify the identification numbers of the rule flows. Separate multiple identification numbers with commas.

Example

dataflows=%STR(10168,10043)

Optional Argument

FOLDER_PATH=path_name

specifies a business rules folder from which you want to export rule flows. Use a forward slash to separate folder names.

If you specify a folder path name, then the rule flows only in that folder are exported. For example, if you specify both RULEFLOWS=ALL and FOLDER_PATH=%STR(Loans/Retail), then the rule flows only in the folder Loans/Retail are exported. If you specify both RULEFLOWS=%STR(10045,10572) and FOLDER_PATH=%STR(Loans/Retail), but neither of the specified rule flows are in the Loans/Retail folder, then no rule flows are exported.

%BRM_EXPORT_RULESET

Exports rule sets from the SAS Decision Manager database into a CSV file. You can modify the CSV file and use it as input to the %BRM_IMPORT_RULESET macro.

Category: Export

See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax

%BRM_EXPORT_RULESET (CSV=output_filename.CSV,
RULESETS=ALL | rule_set_1<, rule_set_2>...<, FOLDER_PATH=path_name>);

Required Arguments

CSV=output_filename

specifies the full path name to the CSV file for the exported data.

RULESETS=ALL | rule_set_1<, rule_set_2>...

specifies the rule sets that you want to export. Specify ALL to export all rule sets. To export only selected rule sets, specify the identification numbers of the rule sets. Separate multiple identification numbers with commas.
Tip
To find the identification number for a rule flow, open the rule flow and click the Properties tab.

Example
rulesets=%STR(10168,10043)

Optional Argument
FOLDER_PATH=path_name
specifies the full path name for the business rules folder from which you want to export rule sets. Use a forward slash to separate folder names.

If you specify a folder path name, then the rule sets only in that folder are exported. For example, if you specify both RULESETS=ALL and FOLDER_PATH=%STR(Loans/Retail), then the rule sets only in the folder Loans/Retail are exported. If you specify both RULESETS=%STR(10045,10572) and FOLDER_PATH=%STR(Loans/Retail), but neither of the specified rule sets are in the Loans/Retail folder, then no rule sets are exported.

%BRM_EXPORT_VOCABULARY
Exports vocabularies from the SAS Decision Manager database into a CSV file. You can modify the CSV file and use it as input to the %BRM_IMPORT_VOCABULARY macro.

Category: Export
See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax
%BRM_EXPORT_VOCABULARY (CSV=output_filename.CSV VOCAB=ALL | vocabulary_1<, vocabulary_2><...<, FOLDER_PATH=path_name>);

Required Arguments
CSV=output_filename
specifies the full path name to the CSV file for the exported data.

VOCAB=ALL | vocabulary_1<, vocabulary_2><...<
specifies the names of the vocabularies that you want to export. Specify ALL to export all vocabularies. To export only selected vocabularies, specify the names of the vocabularies, enclosed in quotation marks. Separate multiple names with commas.

Interaction
To export only a specific list of vocabularies instead of all vocabularies, you must include the FOLDER_PATH= option.

Example
vocab=%STR(LRAutoVocab,AcmeAuto)

Optional Argument
FOLDER_PATH=path_name
specifies the full path name of the business rules folder from which you want to export vocabularies. Use a forward slash to separate folder names.
If you specify a folder path name, then the vocabularies only in that folder are exported. For example, if you specify both VOCAB=ALL and FOLDER_PATH= %STR(Loans/Retail), then the vocabularies only in the folder Retail are exported. If you specify both VOCAB=%STR(loanVocab,riskVocabulary) and FOLDER_PATH= %STR(Loans/Retail), but neither of the specified vocabularies are in the Retail folder, then no vocabularies are exported.

%BRM_GET_RULE_FLOW_CODE

Creates (but does not compile) a DS2 package that contains the SAS code for a specific rule flow. You can run this rule flow package by using the %BRM_RULE_FLOW macro.

Category: Run rule flows

See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax

%BRM_GET_RULE_FLOW_CODE (RULEFLOW_NAME=name,
RULEFLOW_SK=number, FOLDER_PATH=path_name,
FILELOCATION=package_path_name<, optional-arguments>);

Required Arguments

RULEFLOW_NAME=name
specifies the name of the rule flow that you want to export.

Interaction If you specify both the RULEFLOW_NAME= and FOLDER_PATH= options, then you do not need to specify the RULEFLOW_SK= option.

Example ruleflow_name=Ruleflow1

RULEFLOW_SK=number
specifies the identification number of the rule flow. The identification number is shown in parentheses after the rule flow name on the rule flow History page or in the Properties section of the Results tab on the rule flow Tests page.

Interaction If you specify the RULEFLOW_SK= option, then you do not need to specify the RULEFLOW_NAME= or FOLDER_PATH= options.

Example ruleflow_sk=10014

FOLDER_PATH=path_name
specifies the full path name to the business rules folder in which the rule flow is defined. Separate folder names with forward slashes.

Interaction If you specify both the RULEFLOW_NAME= and FOLDER_PATH= options, then you do not need to specify the RULEFLOW_SK= option.

Example folder_path=%STR(Claims/Processing)

FILELOCATION=package_path_name
specifies the full path name to the file for the DS2 package that is produced by the macro. The path name must exist.
Optional Arguments

RULEFLOW_VERSION=version
specifies the version of the rule flow to run. If you do not specify a version number, the macro retrieves the current version of the rule flow.

SERVICETICKET=ticket_identifier
specifies a central authentication service ticket to use for middle-tier authentication.

USERNAME=user_ID
specifies a user ID that has access to retrieve the rule flow. You must also use the PASSWORD= option to specify the password for the user ID.

PASSWORD=password
specifies the password for the user specified with the USERNAME= option.

WEBAUTHDOMAIN=domain
specifies the authentication domain.

Default The domain specified in metadata (DefaultAuth). The metadata entry for the domain must specify the user ID and password for the domain.

%BRM_IMPORT_FOLDER
Imports the folder definitions in the specified CSV file into the SAS Decision Manager database.

Category: Import

See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax

%BRM_IMPORT_FOLDER (CSV=input_filename.CSV,
REJECT=reject_filename.CSV<, BRM_USER=user_ID>);

Required Arguments

CSV=input_filename
specifies the full path name to the CSV file from which you want to import the data. For more information, see “Format of the Folder CSV Input File” on page 75.

REJECT=reject_filename
specifies the full path name to the CSV file to which you want the macro to write any records that were not imported to the SAS Decision Manager database. See “Using the %BRM_IMPORT_FOLDER Macro” on page 75 for more information.

Optional Argument

BRM_USER=user_ID
specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.
Using the %BRM_IMPORT_FOLDER Macro
The %BRM_IMPORT_FOLDER macro enables you to create new folders. You cannot update the content in existing folders with this macro. The macro uses the path name to determine whether a folder already exists. If the path name already exists, then the folder is rejected.

The %BRM_IMPORT_FOLDER macro runs several validation checks as it imports the folders. For example, it checks whether each folder path name begins with a top-level folder and verifies that individual folder names are not longer than 100 characters. If the macro finds an invalid folder definition in the CSV file, it writes a message to the SAS log, and the folder is rejected. The macro writes the input records for the rejected folder to the CSV file that was specified in the REJECT= option.

Format of the Folder CSV Input File
Each row of the CSV input file identifies a folder. The CSV file must contain all of the columns listed in the following table, in the order listed. You must specify values for all columns, except as noted in the following table. To create a blank column in the CSV file, specify two comma separators without any content between them. For example, to create a folder named Applications and to specify a blank column for the folder description, specify the following in the CSV file:

Applications,,N,Loans/Retail

Table 9.2 Format of the Folder CSV Input File

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Can Column Be Blank</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOLDER_NM</td>
<td>The name of the folder to which you want to import the contents of the CSV file.</td>
<td>No</td>
</tr>
<tr>
<td>FOLDER_DESC</td>
<td>The description of the folder.</td>
<td>Yes</td>
</tr>
<tr>
<td>TOP_LEVEL_FOLDER_FLG</td>
<td>Specifies whether the folder is a top-level folder. Specify Y or N.</td>
<td>No</td>
</tr>
<tr>
<td>FOLDER_PATH</td>
<td>The path name to the business rules folder to which you want to import the contents of the CSV file. This path name must exist. Separate folder names with forward slashes.</td>
<td>No</td>
</tr>
</tbody>
</table>

%BRM_IMPORT_LOOKUP
Imports lookup tables from the specified CSV file into the SAS Decision Manager database.

Category: Import

Syntax

```%BRM_IMPORT_LOOKUP (CSV=input_filename.CSV, REJECT=reject_filename.CSV<, BRM_USER=user_ID>);```

**Required Arguments**

**CSV=input_filename**
- Specifies the full path name to the CSV file from which you want to import the data. For more information, see “Format of the Lookup CSV Input File” on page 76.

**REJECT=reject_filename**
- Specifies the full path name to the CSV file to which you want the macro to write any records that were not imported to the SAS Decision Manager database. See “Using the %BRM_IMPORT_LOOKUP Macro” on page 76 for more information.

**Optional Argument**

**BRM_USER=user_ID**
- Specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.

| Default | User ID of the user that is logged on to the server and running the macro |

**Details**

**Using the %BRM_IMPORT_LOOKUP Macro**

The %BRM_IMPORT_LOOKUP macro enables you to do the following tasks:

- add new lookup tables
- add new key-value pairs to existing lookup tables
- update (refresh) existing key-value pairs in existing lookup tables

The macro uses the lookup table name and path name to determine whether a lookup table already exists. If the lookup table already exists, then it is updated. If the path name exists but the lookup table does not exist, the lookup table is created. If the path name does not exist, then the lookup table is rejected.

The %BRM_IMPORT_LOOKUP macro runs several validation checks as it imports the lookup tables. For example, the macro checks whether the LOOKUP_NM or NAME columns in the input file are empty or whether the LOOKUP_NM column specifies an invalid lookup name. All valid key-value pairs are imported. If the macro finds an invalid key-value pair in the CSV file, it writes a message to the SAS log, and the key-value pair is rejected. The macro writes the input records for the rejected key-value pairs to the CSV file that was specified in the REJECT= option.

**Format of the Lookup CSV Input File**

Each row of the CSV input file identifies a key-value pair and the lookup table in which it belongs. The CSV file must contain all of the columns listed in the following table, in the order listed. You must specify values for all columns, except as noted in the table. To create a blank column in the CSV file, specify two comma separators without any content between them. The following example specifies the keys AU and CA and associates them with the values Australia and Canada, respectively. These key-value pairs will be imported into the lookup table Country_Codes.
This input file would appear in Microsoft Excel as shown in the following figure.

<table>
<thead>
<tr>
<th></th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FOLDER_PATH</td>
<td>LOOKUP_NM</td>
<td>DESCRIPTION</td>
<td>NAME</td>
<td>VALUE</td>
</tr>
<tr>
<td>2</td>
<td>Loans/Retail</td>
<td>Country_Codes</td>
<td>,AU,</td>
<td>Australia</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Loans/Retail</td>
<td>Country_Codes</td>
<td>,CA,</td>
<td>Canada</td>
<td></td>
</tr>
</tbody>
</table>

*Note:* When you import a lookup table with the `%BRM_IMPORT_LOOKUP` macro, the first line of the input file must be a header row.

**Table 9.3 Format of the Lookup CSV Input File**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Can Column Be Blank</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOLDER_PATH</td>
<td>The path name to the business rules folder to which you want to import the lookup table. This path name must exist. Separate folder names with forward slashes.</td>
<td>No</td>
</tr>
<tr>
<td>LOOKUP_NM</td>
<td>The name of the lookup table.</td>
<td>No</td>
</tr>
<tr>

<td>The lookup key.</td>
<td>No</td>
</tr>
<tr>
<td>VALUE</td>
<td>The lookup value.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

---

**%BRM_IMPORT_RULE_FLOW**

Imports rule flows from the specified CSV file into the SAS Decision Manager database.

**Category:** Import

**See:** “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

**Syntax**

```
%BRM_IMPORT_RULE_FLOW (CSV= input_filename.CSV, REJECT= reject_filename.CSV<, optional-arguments>);
```

**Required Arguments**

**CSV=input_filename**

specifies the full path name to the CSV file from which you want to import the data. For more information, see “Format of the Rule Flow CSV Input File” on page 78.
REJECT=reject_filename  
specifies the full path name to the CSV file to which you want the macro to write any  
records that were not imported to the SAS Decision Manager database. See “Using  
the %BRM_IMPORT_RULE_FLOW Macro” on page 78 for more information.

Optional Arguments

BRM_USER=user_ID  
specifies the user ID that you want to be associated with the data that is imported.  
This user ID is associated with the imported objects in the SAS Decision Manager  
database and is displayed in the interface.

Default  User ID of the user that is logged on to the server and running the macro

OVERWRITE=Y|N  
specifies whether existing rule flows can be updated. If you specify N, the updates  
are rejected.

Details

Using the %BRM_IMPORT_RULE_FLOW Macro  
The %BRM_IMPORT_RULE_FLOW macro enables you to add new rule flows and to  
update existing rule flows. The macro uses the rule flow name and path name to  
determine whether a rule flow already exists. If the rule flow name and path name  
already exist, then the rule flow is updated (unless OVERWRITE=N is specified when  
the macro is invoked). If the rule flow path name exists but the rule flow name does not  
eXist, the rule flow is created. If the rule flow path name does not exist, then the rule  
flow is rejected.

The %BRM_IMPORT_RULE_FLOW macro runs several validation checks as it  
imports the rule flows. For example, it checks whether a rule set is referenced in a given  
rule flow more than once and whether section codes are correct. If the macro finds a  
validation error in a rule flow, it writes a message to the SAS log, and the rule flow is  
rejected. The macro writes the input records for the rejected rule flow to the CSV file  
that was specified in the REJECT= option.

Format of the Rule Flow CSV Input File  
Each row of the CSV input file identifies a rule set, and a rule flow provides the  
information about how that rule set fits into the rule flow. The CSV file must contain all  
of the columns that are listed in the following table, in the order listed. You must specify  
values for all columns, except as noted in the table. To create a blank column in the CSV  
file, specify two comma separators without any content between them.

For example, to add a rule set to position 1 in the main section of the rule flow named  
assignRisk in the Retail/Loans folder, you can specify the following in the CSV file:  
.,assignRisk,,Y,main,Y,Loans/Retail,RuleSet1,Loans/Retail,Loan_Vocab,,1

Table 9.4 Format of the Rule Flow CSV Input File

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Can Column Be Blank</th>
</tr>
</thead>
<tbody>
<tr>
<td>RULE_FLOW_SK</td>
<td>The identification number of the rule flow.</td>
<td>Yes</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
<td>Can Column Be Blank</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>RULE_FLOW_NM</td>
<td>The name of the rule flow to which you want to add the rule set that is specified in RULE_SET_NM.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_FLOW_SHORT_DESC</td>
<td>The description of the rule flow.</td>
<td>Yes</td>
</tr>
<tr>
<td>RULE_FIRED_OUTPUT_FLG</td>
<td>Specifies whether to create output only for records that fire rules. Specify Y or N. For some types of applications, only the output records for which at least one rule has fired are of interest. Limiting output is useful for applications that detect outliers, such as applications that detect fraud.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_SET_SECTION_CODE</td>
<td>The section of the rule flow to which the rule set that is specified in RULE_SET_NM belongs. Specify init, groupstart, main, groupend, or final. The codes groupstart and groupend are valid only if you also specify at least one term for BY_TERM. See “Simple Rule Flows, Complex Rule Flows, and BY Groups” in SAS Business Rules Manager: User’s Guide for more information.</td>
<td>No</td>
</tr>
<tr>
<td>INCLUDE_NODE_OBJECT_FLG</td>
<td>Specifies whether the rule set specified in the RULE_SET_NM field is run when the rule flow executes. Specify Y or N. Selectively running certain rule sets is useful during rule flow development and testing.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_FLOW_PATH</td>
<td>The path name to the business rules folder for the rule flow. This path name must exist. Separate folder names with forward slashes.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_SET_NM</td>
<td>The name of the rule set to be added to the rule flow. A rule set can be added to the same rule flow only once.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_SET_PATH</td>
<td>The path name to the business rules folder for the rule set that is specified by RULE_SET_NM. The rule set must exist at the specified location. Separate folder names with forward slashes.</td>
<td>No</td>
</tr>
<tr>
<td>VOCAB_NM</td>
<td>The name of the vocabulary that the rule set uses. All rule sets in the same rule flow must use the same vocabulary.</td>
<td>No</td>
</tr>
<tr>
<td>BY_TERM</td>
<td>The list of BY-group terms that the rule set uses. Separate multiple BY-group terms with commas. The BY-group terms must be the same for all rule sets that are in the same rule flow. All of the BY-group terms must belong to the same vocabulary. See “Simple Rule Flows, Complex Rule Flows, and BY Groups” in SAS Business Rules Manager: User’s Guide for more information.</td>
<td>Yes</td>
</tr>
<tr>
<td>ORDER</td>
<td>The order number for the rule set that is in the rule flow. Order numbers must start with 1 and be continuous through the entire rule flow. Do not restart order numbers at section boundaries.</td>
<td>No</td>
</tr>
</tbody>
</table>
%BRM_IMPORT_RULESET

Imports rule sets from the specified CSV file into the SAS Decision Manager database.

**Category:** Import

**Requirement:** The vocabulary that is used by a rule set must exist before you import the rule set.

**See:** “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

**Syntax**

```
%BRM_IMPORT_RULESET (CSV=input_filename.CSV,
REJECT=reject_filename.CSV<, optional-arguments>);
```

**Required Arguments**

**CSV=** *input_filename*

specifies the full path name to the CSV file from which you want to import the data. For more information, see “Format of Rule Set CSV Input File” on page 81.

**REJECT=** *reject_filename*

specifies the full path name of the CSV file to which you want the macro to write any records that were not imported to the SAS Decision Manager database. See “Using the %BRM_IMPORT_RULESET Macro” on page 81 for more information.

**Optional Arguments**

**BRM_USER=** *user_ID*

specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.

**Default** User ID of the user that is logged on to the server and running the macro

**LOCK=** *Y|N*

specifies whether to lock the imported rule set.

**Default** N

**NEWVERSIONS=** *Y|N*

specifies whether new, unlocked versions of each rule set are created with the imported content. If you specify Y, any existing unlocked versions of the rule sets are locked before the new unlocked version is imported. This option is useful when you are updating rule sets that are used in rule flows that have been published.

If you specify N, rule sets that are locked are not updated and are written to the reject file specified by the CSV= option.

**Default** N

**OVERWRITE=** *Y|N*

specifies whether existing rule sets can be updated. If you specify N, the updates are rejected.
Details

**Using the %BRM_IMPORT_RULESET Macro**

The %BRM_IMPORT_RULESET macro enables you to add new rule sets and to update existing rule sets. The macro uses the rule set name and rule set path name to determine whether a rule set already exists. If the rule set path name and name already exist, then the rule set is updated. If the rule set path name exists but the rule set name does not exist, the rule set is created. If the rule set path name does not exist, then the rule set is rejected.

The %BRM_IMPORT_RULESET macro runs several validation checks as it imports the rule sets. For example, it verifies that the expressions are valid, ensures that the first rule in each rule set uses the IF operator, and verifies that the specified vocabularies exist. If the macro finds a validation error in a rule set, it writes a message to the SAS log, and the rule set is rejected. The macro writes the input records for the rejected rule set and the reason that the record was rejected to the CSV file that was specified in the REJECT= option.

Rule sets that you import with the %BRM_IMPORT_RULESET macro are imported as unlocked versions. Before you can publish rule flows that contain the imported rule sets, you must lock the rule sets.

**Format of Rule Set CSV Input File**

Each row of the CSV input file specifies a rule, rule set, term, and an expression for that term. The row also specifies whether the expression is a condition expression or an action expression. Each row of the input file can specify only one condition expression or one action expression for a given rule. The CSV file must contain all of the columns that are listed in the following table, in the order listed. You must specify values for all columns, except as noted in the table. To create a blank column in the CSV file, specify two comma separators without any content between them.

For example, the following two lines add a rule to the rule set named riskSet, which uses the Loan_Vocab vocabulary. The first line adds the condition term CondTerm and assigns to it the expression <5000. The second line adds the action term ActionTerm and assigns to it the expression 'Bad'.

```plaintext
.,riskSet,,Loan_Vocab,Loans/Retail,RuleName1,,1,IF,Y,CondTerm,<5000,1,CONDITION
.,riskSet,,Loan_Vocab,Loans/Retail,RuleName1,,1,IF,Y,ActionTerm,'Bad',1,ACTION
```

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Can Column Be Blank</th>
</tr>
</thead>
<tbody>
<tr>
<td>RULE_SET_SK</td>
<td>The identification number of the rule set.</td>
<td>Yes</td>
</tr>
<tr>
<td>RULE_SET_NM</td>
<td>The name of the rule set to which you want to add the rule that is specified in RULE_NM.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_SET_DESC</td>
<td>The description of the rule set.</td>
<td>Yes</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
<td>Can Column Be Blank</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>VOCAB_NM</td>
<td>The name of the vocabulary that the rule set uses. All rules in the same rule set must use the same vocabulary.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_SET_PATH</td>
<td>The path name to the business rules folder for the rule set. This path name must exist. Separate folder names with forward slashes.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_NM</td>
<td>The name of the rule to be added to the rule set.</td>
<td>No</td>
</tr>
<tr>
<td>RULE_DESC</td>
<td>The description of the rule.</td>
<td>Yes</td>
</tr>
<tr>
<td>RULE_SEQ_NO</td>
<td>The order number for the rule that is in the rule set. Order numbers in a rule set start with 1.</td>
<td>No</td>
</tr>
<tr>
<td>CONDITIONAL_NM</td>
<td>The operator for the rule. Specify <code>IF</code>, <code>ELSEIF</code>, or <code>OR</code>. The first rule in a rule set must use the <code>IF</code> operator. For information about these operators, see “Controlling Which Conditions Are Evaluated” in SAS Business Rules Manager: User’s Guide.</td>
<td>No</td>
</tr>
<tr>
<td>RECORD_RULE_FIRED_FLG</td>
<td>Specifies whether a rule-fired record is created when the condition for the rule identified in the RULE_NM field evaluates to <code>True</code>. Specify <code>Y</code> or <code>N</code>. If you specify <code>N</code>, a rule-fired record is not created regardless of what the condition evaluates to.</td>
<td>No</td>
</tr>
<tr>
<td>LHS_TERM</td>
<td>The term for the expression specified in the EXPRESSION column. Terms that are specified in the LHS_TERM column are the condition and action terms for the rule set. In the rule set editor, these terms appear in the Term column in the list view. They appear as column headings in the horizontal view and as row headings in the vertical view.</td>
<td>No</td>
</tr>
<tr>
<td>EXPRESSION</td>
<td>A single condition or action expression for the term specified in the LHS_TERM column. This expression is the expression that you would enter into a cell in the rule set editor. Enclose character strings in single quotation marks. To specify a missing expression, enter a period and an underscore (<code>._</code>). See “Defining New Rules in the Rule Set” in SAS Business Rules Manager: User’s Guide for more information about expressions.</td>
<td>Yes</td>
</tr>
<tr>
<td>EXPRESSION_ORDER</td>
<td>The order number of the rule’s condition or action expressions. A rule’s condition and action expressions are numbered beginning with 1. For example, a rule might have two condition expressions that are numbered 1 and 2, and it might have three action expressions that are numbered 1, 2, and 3.</td>
<td>No</td>
</tr>
</tbody>
</table>
%BRM_IMPORT_VOCABULARY
Imports vocabulary terms from the specified CSV file into the SAS Decision Manager database.

Category: Import
See: “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

Syntax
%BRM_IMPORT_VOCABULARY (CSV=input_filename.CSV, REJECT=reject_filename.CSV,<, BRM_USER=user_ID>);

Required Arguments

CSV=input_filename
specifies the full path name to the CSV file that defines the vocabulary that you want to import. For more information, see “Format of the Vocabulary CSV Input File” on page 84.

REJECT=reject_filename
specifies the full path name to the CSV file to which you want the macro to write any records that were not imported to the SAS Decision Manager database. See “Using the %BRM_IMPORT_VOCABULARY Macro” on page 83 for more information.

Optional Argument

BRM_USER=user_ID
specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.

Default
User ID of the user that is logged on to the server and running the macro

Details

Using the %BRM_IMPORT_VOCABULARY Macro
The %BRM_IMPORT_VOCABULARY macro enables you to add new vocabulary terms. You can also use this macro to update the description, domain type, and domain values for existing terms. You cannot use this macro to change the data type or name of an existing term.

The %BRM_IMPORT_VOCABULARY macro runs several validation checks as it imports the vocabulary terms. For example, it verifies that term, entity, and vocabulary names are valid, and ensures that a term is not duplicated in a vocabulary. If the macro
finds a validation error, it writes a message to the SAS log, and the term is rejected. The macro writes the input records for the rejected term to the CSV file that was specified in the REJECT= option.

**Format of the Vocabulary CSV Input File**

Each row of the CSV input file defines a term, including the term data type, domain type, and the entity and vocabulary that contains the term. The CSV file must contain all of the columns listed in the following table, in the order listed. You must specify values for all columns, except as noted in the table. To create a blank column in the CSV file, specify two comma separators without any content between them.

For example, the following lines add two terms to the Loan_Vocab vocabulary. The first term is named Priority, and it is an integer with domain values in the range 1–10. The second term is named RiskCategory, and it is a character string with domain values 'Low' and 'High'.

```
Loan_Vocab,,AppEnt,,Priority,,Integer,discrete,(1-10),N,N,Loans/Retail
Loan_Vocab,,AppEnt,,RiskCategory,,Character,discrete,(Low;High),N,N,Loans/Retail
```

<table>

</tr>
<tr>
<td>VOCAB_TERM_DOMAIN_TYPE_TXT</td>
</tr>
<tr>
<td>VOCAB_TERM_DOMAIN_TXT</td>
</tr>
</tbody>
</table>
### VOCAB_TERM_INPUT_EXCLUDE_FLG
Specifies whether the term must be mapped to a column in an input data set. Specify Y or N.

### VOCAB_TERM_OUTPUT_EXCLUDE_FLG
Specifies whether to exclude the term from the output data sets created by rule flows. Specify Y or N.

### FOLDER_PATH
The path name to the business rules folder for the rule flow. This path name must exist. Separate folder names with forward slashes.

---

### %BRM_LOAD_VOCABULARY

Loads the vocabulary terms that are defined in the WORK.TERM data set into the SAS Decision Manager database. You can create the WORK.TERM data set by using the %BRM_CREATE_TEMP_TERM macro.

**Category:** Create terms

**See:** "Requirements and Tips for Using SAS Business Rules Manager Macros" on page 65

#### Syntax

```
%BRM_LOAD_VOCABULARY (FOLDER_PATH=path_name,
VOCAB_NM=vocabulary_name, VOCAB_ENTITY_NM=entity_name
<, BRM_USER=user_ID>);
```

#### Required Arguments

**FOLDER_PATH=path_name**
specifies the path name of the business rules folder to which you want to import the vocabulary terms. Separate folder names with forward slashes.

**Requirement**
The path name must exist. If the path name does not exist, the macro terminates and writes an error message to the SAS log.

**Example**
```
folder_path=%STR(Loans/Retail/Applications)
```

**VOCAB_NM=vocabulary_name**
specifies the name of the vocabulary to which the terms in the WORK.TERM file will be added.

**Requirement**
The vocabulary must not exist. If it already exists, the macro terminates and writes an error message to the SAS log.

**VOCAB_ENTITY_NM=entity_name**
specifies the name of the entity to which the terms in the WORK.TERM file will be added.

**Requirement**
This entity must not exist. If it already exists, the macro terminates and writes an error message to the SAS log.
**Optional Argument**

**BRM_USER=user_ID**
specifies the user ID that you want to be associated with the data that is imported. This user ID is associated with the imported objects in the SAS Decision Manager database and is displayed in the interface.

Default: User ID of the user that is logged on to the server and running the macro

---

**%BRM_PUBLISH_RULE_FLOW**

Publishes a specific rule flow.

**Category:** Publish rule flows

**See:** “Requirements and Tips for Using SAS Business Rules Manager Macros” on page 65

**Syntax**

```sas
%BRM_PUBLISH_RULE_FLOW (RULEFLOW_NAME=name, RULEFLOW_SK=number, FOLDER_PATH=path_name, METADATA_FOLDER=path_name);
```

**Required Arguments**

**RULEFLOW_NAME=name**
specifies the name of the rule flow that you want to publish.

Interaction: Specify either the RULEFLOW_SK= option or both the RULEFLOW_NAME= and FOLDER_PATH= options.

Example: `ruleflow_name=Ruleflow1`

**RULEFLOW_SK=number**
specifies the identification number of the rule flow. The identification number is shown in parentheses after the rule flow name on the rule flow History page or in the Properties section of the Results tab on the rule flow Tests page.

Interaction: Specify either the RULEFLOW_SK= option or both the RULEFLOW_NAME= and FOLDER_PATH= options.

Example: `ruleflow_sk=10014`

**FOLDER_PATH=path_name**
specifies the full path name to the business rules folder in which the rule flow is defined. Separate folder names with forward slashes.

Interaction: Specify either the RULEFLOW_SK= option or both the RULEFLOW_NAME= and FOLDER_PATH= options.

Example: `folder_path=%STR(Claims/Processing)`

**METADATA_FOLDER=path_name**
specifies the path name to the folder that contains the metadata for the rule flow.
%BRM_RULE_FLOW

Runs rule flows. You can use the %BRM_RULE_FLOW macro to run packages that were created with the %BRM_GET_RULE_FLOW_CODE macro.

**Category:** Run rule flows

**See:** "Requirements and Tips for Using SAS Business Rules Manager Macros" on page 65

**Syntax**

```sas
FILENAME fileref"path_name";
%BRM_RULE_FLOW (INPUTTABLE=libref.table_name,
MAPPING=mapfile.mapping, FILELOCATION=fileref,
RULEFIRE=Y | N | S | D | Q<, optional-arguments>);
```

**Required Arguments**

**INPUTTABLE=libref.table_name**

specifies the libref and table name for the input table against which you want to run the rule flow.

**MAPPING=mapfile.mapping**

specifies the file that contains the variable mappings. This file is typically a SAS file. See “Creating a Mapping Table” on page 88.

**FILELOCATION=fileref**

specifies the fileref for the file that contains the DS2 package code for the rule flow. See SAS DATA Step Statements: Reference for information about the FILENAME statement and how to define filerefs.

**RULEFIRE=Y | N | S | D | Q**

specifies whether rule-fired data is recorded when the rule flow is run.

- **Y** records both summary and detailed rule-fired data.
- **N** does not record any rule-fired data.
- **S** records only summary rule-fired data.
- **D** records only detailed rule-fired data.
- **Q** collects rule-fired data but does not generate summary or detailed rule-fired tables. The rule-fired data is added to the output table in columns named Rule Fired Count and _RULEFIREDCOUNTS_1.

**Optional Arguments**

**CODETYPE=DS1 | DS2**

determines whether SAS Business Rules Manager generates DS2 code or DATA step (DS1) code for rule flows. In many cases, you will get better performance by specifying DS1. However, consider specifying DS2 if your input data is in Teradata, Greenplum, or Hadoop, and the SAS Code Accelerator is installed.
If the rule flows use data grids, you must specify CODETYPE=DS2.

**THREADCOUNT=number**

Specifies the number of processors that are available for concurrent processing. If the rule flow contains rules in either the INIT or FINAL sections, the value of the THREADCOUNT option is set to 1 when rule flow tests are run. This option is ignored when rule flows are executed in the database.

Default: the value of the CPUCOUNT= system option

Interaction: This option is used only if CODETYPE=DS2.

See: “CPUCOUNT= System Option” in *SAS System Options: Reference*

### Details

**Running Rule Flows Dynamically**

You can use the &DCM_USE_LATEST_VERSION macro variable and either the &DCM_RULEFLOW_NAME or &DCM_DEPLOYED_RULEFLOW_NAME macro variable to ensure that when a rule flow is run, the latest version of the rule flow is always used. If you specify both &DCM_RULEFLOW_NAME and &DCM_DEPLOYED_RULEFLOW_NAME, then the name specified by &DCM_DEPLOYED_RULEFLOW_NAME is used.

For &DCM_DEPLOYED_RULEFLOW_NAME, specify the name of the published rule flow and the identification number of the rule flow. You can find the published name and identification number in the **Name** column of the rule flow **History** page. For example:

```
%let DCM_DEPLOYED_RULEFLOW_NAME= published_flow_name(ID_number);
```

**Note:** If you specify &DCM_RULEFLOW_NAME and SAS Business Rules Manager finds multiple rule flows that match the specified name, it writes an error message in the SAS log, and the rule flow is not executed. If you encounter this issue, specify the specific rule flow by using &DCM_DEPLOYED_RULEFLOW_NAME.

Define these macro variables in preprocessing code such as in the Preprocessing Code section of a rule flow test or in the **Precode** section on the **Precode and Postcode** tab in SAS Data Integration Studio. Define these variables before calling the %BRM_RULE_FLOW macro. For example:

```
%let DCM_USE_LATEST_VERSION=Y;
%let DCM_RULEFLOW_NAME=rule_flow_name;
```

**Note:** SAS Data Integration Studio uses the latest version of the rule flow that matches the variable mappings in the Business Rules transformation. SAS Business Rules Manager writes a note in the SAS log that states which version was selected.

### Creating a Mapping Table

**Note:** You must create a mapping table only if you are invoking the %BRM_RULE_FLOW macro in SAS code. In SAS Data Integration Studio and in the SAS Business Rules Manager test interface, the mapping table is created for you.

You must supply a file that maps terms in the rule flow to columns in the input table. You can create this file manually, or you can create and run a rule flow test in SAS Business Rules Manager. The mapping tables that are created when a rule flow test is
run are written to the WORK library. The code that produces the mapping table is written to the SAS log.

The mapping table also defines the names and structure of the output table, the rule-fired summary table, the rule-fired details table, and the test information table that are generated by the rule flow. The structure of the rule-fired summary table, rule-fired details table, and test information table is static, and you must define them as shown in “Example: Creating a Mapping File for a Simple Rule Flow” on page 89.

The number in the data set ID column in the example specifies which table the column that is being defined belongs to. The following table lists the possible values for this column and the default table names that are generated when a rule flow is run in SAS Data Integration Studio.

<table>
<thead>
<tr>
<th>Data Set ID</th>
<th>Table</th>
<th>Contents</th>
<th>Name Generated by SAS Data Integration Studio</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Rule-fired details</td>
<td>One row for each time that a rule evaluates to true. There might be multiple entries for the same rule, but each entry has different values for the _recordCorrelationKey and RULE_ACTION_FIRE_ID columns.</td>
<td>DCM_RULE_ACTION_FIRE</td>
</tr>
<tr>

</table>

**Example: Creating a Mapping File for a Simple Rule Flow**

The following example creates a mapping table that maps terms in the rule flow to an input table with five columns. The column names are EngineSize, Make, Model, MSRP, and Type.

The example assumes that the following librefs have been defined: RULEFIRE, DEPLOY, INDATA, and OUTLIB. It uses the table names listed the following table.

<table>
<thead>
<tr>
<th>Data Set ID</th>
<th>Table</th>
<th>Libref and Table Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Rule-fired details</td>
<td>RULEFIRE.Details</td>
</tr>
<tr>
<td>2</td>
<td>Test information</td>
<td>DEPLOY.ThisRun</td>
</tr>
<tr>
<td>4</td>
<td>Input</td>
<td>INDATA.InData</td>
</tr>
<tr>
<td>5</td>
<td>Output</td>
<td>OUTLIB.MyResults</td>
</tr>
</tbody>
</table>
