You manage configuration properties for SAS Viya servers, services, and applications using the Configuration pages in SAS Environment Manager.
A programming-only deployment does not use SAS Viya services and SAS Environment Manager.

You manage configuration properties for SAS Studio 5.2 (Basic) by modifying its configuration file. For more information, see How To Configure SAS Studio 5.2 (Basic) on page 9.

Configuration Properties: How to Configure Services

Introduction

These instructions explain how to view and modify service configuration properties using SAS Environment Manager.

Navigation

In the applications menu (≡), select Administration ⇒ Manage Environment. In the navigation bar, click ⌁.

The Configuration page is an advanced interface. It is available to only SAS Administrators by default.

Edit Configuration Instances

Note: Most SAS Viya applications and servers have a corresponding service in which you set their configuration property values.

1 Using the drop-down list, choose All services.

2 In the navigation pane, select a service whose configuration properties you want to change.

3 Next to the configuration instance, click ⬤.
In the Edit Configuration dialog box, change the value in one or more of the configuration property fields.

When you are finished, click **Save**.

On a non-cloud platform, such as native Linux, some services require that you restart them when configuration changes are made. See "What Services Must Be Restarted?" on page 15.

### Create Configuration Instances

In some situations, you might decide to create a configuration instance. For example, if you want to configure a logging level for a service that is not already associated with logging.level, you must create a new configuration instance of logging.level for that service.

1. Using the drop-down list, choose **All services**.

2. Select a service for which you want to create a new configuration instance.

3. At the top of the content pane, click **New Configuration**.

4. In the Select Definition dialog box, select a **configuration definition** from which to create a new configuration instance.

5. In **Services**, make sure that the service displayed is the one for which you want to create a new definition. If the correct service is displayed, skip to **Step 6**.

   Otherwise, do the following:

   a. Next to **Services**, click ![services](link).

   b. In the Choose Services dialog box, highlight the service to which the configuration instance you are creating applies, and click ![apply services](link).

   c. Remove any services for which you do not want to create a configuration instance, by highlighting the service and clicking ![remove services](link).

   d. When you are finished, click **OK**.

6. Continue entering values. When you are finished, click **Save**.

   **TIP** Properties with a red asterisk (*) are required to have a value.

7. On a non-cloud platform, such as native Linux, some services require that you restart them when configuration changes are made. See "What Services Must Be Restarted?" on page 15.
Review Default Configuration Values

1. In the top left corner of the window, make sure that **Basic services** is selected.

2. In **Basic services** list, select a service, application, or server whose configuration instance must be created.

   ![Tip] Incomplete required configuration instances are marked with a half-filled red circle.

3. On the right side of the window, next to the half-filled red circle (●), click.[1]

4. Most configuration definitions apply to only one service. In the New Configuration dialog box, if there is no edit icon (●) next to the **Services** field, skip to **Step 5**.

   Otherwise, do the following:
   a. Next to **Services**, click (●).
   b. In the Choose Services dialog box, highlight the service to which the configuration instance you are creating applies, and click (●).
   c. When you are finished, click **OK**.

5. Continue entering values. When you are finished, click **Save**.

   ![Tip] You are required to provide a value for properties marked with a red asterisk (*).

6. Repeat steps 2 – 5 for every configuration instance that is incomplete (●).

Set Time-out Interval for SAS Viya Web Applications

Using SAS Environment Manager, you can change the session time-out interval for SAS Viya web applications. The session time-out specifies the amount of time between checks for user activity, minus a five-minute warning period. The activity check interval starts when a user logs on to the application, not when a user performs an action. The application checks for activity within the specified interval. If activity has occurred, the counter resets at the time of the check. If no activity has occurred, a window appears that warns the user that they will be logged off after five minutes. The window displays a countdown of the time and options to extend the session (which resets the time-out interval) or to immediately log off.

For example, the default global value for SAS Viya web applications is 30 minutes. Suppose that you log on to the application, immediately perform an action, and then leave the application idle. The application checks for activity 25 minutes after you log on to the application and discovers that activity has occurred within that period. The application then resets the counter and checks again after
another 25 minutes. If your action occurred within the first minute of logging on to the application and the application is idle after that, you will not receive the logoff warning message until 55 minutes have passed.

You can set the time-out interval for all applications or only for specific applications. However, the time-out value for the SAS Logon Manager service must be at least as long as the longest time-out interval for any application. When the SAS Logon Manager reaches its time-out interval, all other services end. For example, suppose that you specify a time-out value of 45 minutes for Application A but leave the default value of 30 minutes unchanged for everything else (including SAS Logon Manager). Application A exhibits the behavior of using the 30-minute time-out value with which SAS Logon is configured. In order for Application A to honor its 45-minute time-out value, you must also set the time-out value for SAS Logon Manager to at least 45 minutes.

**IMPORTANT** In SAS Studio 5.2 (Basic), individual users set the session time-out interval up to a maximum that is specified by the administrator with `server.servlet.session.timeout`. For more information, see “SAS Studio 5.2 (Basic)” on page 64.

1. Using the drop-down list, choose **Definitions**.

2. In the list of configuration definitions, select **server**. In the top right corner of the view, click **New Configuration**.

3. The **Services** field in the New server Configuration dialog box specifies the applications to which the time-out value applies.

   To specify the time-out interval for all applications, do not change the default value of **Global** in the **Services** field.

   To specify the time-out interval for specific applications, click **Services**.

   In the Choose Services dialog box, highlight one or more SAS Viya web applications, click **»**, and click **OK**.
4 In the New server Configuration dialog box, click **Add property**.

5 In the Add property dialog box, in the **Name** field, enter the following Spring server property: `servlet.session.timeout`. See “Spring Boot Services” on page 71 for a list of services whose properties can be changed.

6 In the **Value** field, enter the number of seconds, minus a five minute (300 second) warning period, between checks for user activity. For example, if you specify 3600 seconds (60 minutes), the user activity check is performed after 55 minutes (3600 second time-out value minus 300-second warning period). See the introduction to this procedure for more information.

**Note:** The minimum valid value for this field is **360**, which yields a time-out interval of six minutes.
Click **Save** to close the Add Property window and **Save** to close the New Server Configuration window.

If you change the global time-out interval, you must restart all services in order for the change to take effect for any new sign-ins. If you change the interval for specific services, you must restart the services that you changed.

---

**Disable Opt-In Notifications**

SAS Viya provides messages called *notifications* in various web applications. The number of unread *subscription-based (opt-in) notifications* is displayed in a red box in place of 📥 on the right side of the web application's banner.

When you click on the number, the Notification Center window displays the notifications. You can delete one or all of the notifications from the window.
The SAS Viya Notifications service processes only events that are published by participating services and applications, such as SAS Visual Analytics and the Backup service.

To disable opt-in notifications, follow these steps:

1. Using the drop-down list, choose All services.

2. In the search field, enter notifications.

3. In list, select Notifications service.

   **TIP** At the top right side of the window, click to easily locate the Notifications service.

4. In the content pane, locate sas.notifications and click on the right side of the window.

5. In the Edit sas.notifications Configuration dialog box, disable the Enabled slider and click Save.

   **IMPORTANT** Disabling sas.notifications.enabled, turns off all subscription-based notification channels including subscription-based email notifications. To disable only subscription-based email notifications, disable sas.notifications.delivery.mailEnabled.

---

**Configuration Properties: How to Configure SAS Studio 5.2 (Basic)**

**Update SAS Studio Configuration Properties**

**Note:** SAS supplies two versions of SAS Studio, 5.2 (Basic) and 5.2 (Enterprise). SAS Viya programming-only deployments use SAS Studio 5.2 (Basic). For more information, see “SAS Studio 5.2” in What's New in SAS 9.4 and SAS Viya.
Note: You specify SAS Studio 5.2 (Enterprise) properties in the same way as the other SAS Viya applications and services. For more information, see “Configuration Properties: How to Configure Services”.

To customize web application configuration properties for SAS Studio 5.2 (Basic), edit init_usermods.properties, in the path appropriate for your operating system:

- **Linux:**
  
  `/opt/sas/viya/config/etc/sasstudio/default/init_usermods.properties`

- **Windows:**
  
  `\ProgramData\SAS\Viya\etc\sasstudio\default\init_usermods.properties`

Note: For sites that use Ansible: Ansible updates init_deployment.properties when it is run. Therefore, SAS Studio configuration changes that you make to init_usermods.properties are not overwritten by Ansible and are carried forward.

For a listing of configuration properties that you can update, see “SAS Studio 5.2 (Basic)” on page 64.

Changes take effect after you restart the web application. For more information, see instructions appropriate for your operating system.

**TIP** Values that you specify in the init_usermods.properties file have precedence over corresponding values in other files. Unlike values in other files, values in the init_usermods.properties survive software upgrades.

---

**Set File Navigation Options**

For SAS Studio 5.2 (Basic), the root directories that are available in the **Explorer** section depend on the value for the **sas.studio.fileNavigationRoot** property.

You can specify a value of USER, SYSTEM, or CUSTOM for the **sas.studio.fileNavigationRoot** property. The default value is USER.

- **If** **sas.studio.fileNavigationRoot** **is set to USER,** the **Explorer** section displays an empty **Folder Shortcuts** folder and a **Files** folder.

  - On Windows, the **Files** folder is mapped to your **My Documents** folder.
  - On Linux, the **Files** folder is mapped to your **$HOME** directory.

- **If** **sas.studio.fileNavigationRoot** **is set to SYSTEM,** the **Explorer** section displays the following information:

  - On Windows, the **Folder Shortcuts** folder includes a predefined shortcut to your **My Documents** folder.
  - On Linux, the **Folder Shortcuts** folder includes a predefined shortcut to your home directory. The **Files** folder is mapped to the system **root** directory for the server.

- **If** **sas.studio.fileNavigationRoot** **is set to CUSTOM,** the path displayed in the **Explorer** section is specified by the value of the **sas.studio.fileNavigationCustomRootPath** property.
Operations

Automate Configuration Properties during Deployment (Ansible)

You can deploy SAS Viya with configuration values that are customized to your site by running your Ansible playbook with sitedefault.yml. Using sitedefault.yml, enables you to provision multiple machines in the same manner, and prevents you from having to modify configuration values with an administration interface after deployment.

Note: It is extremely important that the initial values applied with sitedefault.yml are correct. After you specify a value with sitedefault.yml, you cannot re-run sitedefault.yml to change that value. You can re-run sitedefault.yml only to specify properties that have not already been specified. To change properties set with sitedefault.yml, you must use the sas-bootstrap-config CLI directly or use another administration interface, such as SAS Environment Manager.

To specify configuration values using sitedefault.yml, follow these steps:

1. Sign on to your Ansible controller with administrator privileges and locate the file, /playbook/roles/consul/files/sitedefault_sample.yml.

2. Make a copy of sitedefault_sample.yml and name the copy, sitedefault.yml.

3. Using a text editor, open sitedefault.yml and add values that are valid for your site.
   
   Configuration values that apply to all services should be nested under config: / application:
   
   Values that apply only to a specific service should be nested under config: / service_name:
   
   For information about the LDAP properties used in sitedefault.yml, see “sas.identities.providers.ldap” on page 35.

   For information about all the properties that can be used in sitedefault.yml, see “Configuration Properties: Reference (Services)” on page 22.

   CAUTION
   Some properties require passwords. If properties with passwords are specified in sitedefault.yml, you must secure the file appropriately. If you chose not to supply the properties in sitedefault.yml, then you can enter them using SAS Environment Manager. (Sign in to SAS Environment Manager as sasboot and follow the instructions in “Configure the Connection to Your Identity Provider” in SAS Viya for Linux: Deployment Guide.)

4. When you are finished, save sitedefault.yml and make sure that it resides in the /playbook/roles/consul/files directory of the playbook.

5. Run your Ansible playbook. Running the playbook using the site.yml file checks for sitedefault.yml, and uses those settings if the file is present.

Here is an example:
ansible-playbook site.yml

For a complete list of playbook commands, see “Deploy the Software” in SAS Viya for Linux: Deployment Guide.

6 After the playbook is run, verify that the configuration values are successfully loaded into the configuration server by performing the following steps:

a Verify that a copy of sitedefault.yml resides in /viya/config/etc/consul.d/default/.

b Verify that config-kv-bulkload-sitedefault.json resides in /viya/config/etc/consul.d/.

c View the configuration properties for a configuration definition such as, SAS Logon Manager, in SAS Environment Manager to verify that the specified values are present.

For more information, follow the first five steps in “Edit Configuration Instances” on page 3.

---

Customizing Configuration for All Java Services

You can use global configuration files to customize the start-up options for all Java services on a Linux deployment.

Follow these steps:

1 In the /opt/sas/viya/config/etc/sysconfig/sas-javaexntl/ directory, create a file whose name starts with sas-java-services. For example, for a monitoring framework named AppMonitor, the configuration file could be named sas-java-services-appmon.

   Note: Options are applied in all of the files in the /opt/sas/viya/config/etc/sysconfig/sas-javaexntl/ directory whose filenames begin with sas-java-services, regardless of the rest of the filename. If the directory contains renamed old files or work files, the options in those files will be applied as well.

2 In the configuration file, add configuration statements for each option that you want to specify. This is the format of each configuration statement:

   export JAVA_OPTION_<variable_name>=<JVM_command_line_option>

   Each JAVA_OPTION_<variable_name> value must be globally unique. Do not use names that might conflict with names in other configuration files.

   The JVM_command_line_option must be enclosed in double quotation marks if the command contains blanks.

   For example, a monitoring framework named AppMonitor requires multiple JVM start-up options. The file /opt/sas/viya/config/etc/sysconfig/sas-javaexntl/sas-java-services-appmon could contain these options:

   export JAVA_OPTION_APPMON_AGENT=-javaagent:/opt/appmon/javaagent.jar
   export JAVA_OPTION_APPMON_CONTROLLER_HOST=-Daappmonitor.controller.hostName=eval.appmonitor.com
   export JAVA_OPTION_APPMON_CONTROLLER_PORT=-Dappmonitor.controller.port=443
   export JAVA_OPTION_APPMON_CONTROLLER_SSL=-Dappmonitor.controller.ssl.enabled=true
   export JAVA_OPTION_APPMON_AGENT_NODE=-Dappmonitor.agent.nodeName=viya1
   export JAVA_OPTION_APPMON_APPNAME=-Dappmonitor.agent.applicationName=prod-vdmml
   export JAVA_OPTION_APPMON_PROXY_HOST=-Dappmonitor.http.proxyHost/inet.abc.com
   export JAVA_OPTION_APPMON_PROXY_PORTS=-Dappmonitor.http.proxyPort=808
3 Restart one service and inspect the service log to confirm that all options are applied as expected.

4 Modify the configuration file and restart. Repeat until all options are applied correctly.

5 After all options are correct, restart all services for the new options to take effect.

CAUTION
Global configuration should be used carefully. Global options, especially invasive options like Java agents, can have a significant impact on the operation of a SAS Viya system. New options should be carefully tested and validated before deploying them to production systems.

---

Configuration Properties: Concepts

What Is SAS Viya Configuration?

From SAS Environment Manager, you can manage the configuration needs of the various SAS Viya services.

Configuration Components

A service’s configuration consists of the following components:

- **configuration definition**: A schema that describes a type of configuration. You create configuration instances from a configuration definition. Some examples of configuration definitions are: jvm, spring, and sas.reportdata.

  Note: Configuration definitions that apply to one or a small set of services are referred to as service configuration definitions. System configuration definitions can apply to any service.

- **configuration instance**: A collection of name-value pairs (a property) that a service uses. (These name-value pairs can sometimes be nested.)

  Note: Certain configuration instances are required for a service to be able to run. See “Review Default Configuration Values” on page 5.
How Configuration Definitions and Instances Are Displayed

The Configuration window in SAS Environment Manager contains three views: **Basic services**, **All services**, and **Definitions**.

*Figure 1  Configuration Views in SAS Environment Manager*

The **All services** view lists all SAS Viya services that are currently deployed and those that an administrator has not manually stopped. A SAS Viya service can be affected by one or more configuration instances. Most services have a one-to-one relationship with a configuration instance. However, some services are associated with more than one configuration instance. It is important to
note that some services do not have any configuration instances, but you can specify configuration properties for any of these services.

The Definitions view lists all the SAS Viya configuration definitions.

The Basic services view contains those services with configuration properties for which SAS cannot create a reasonable default (for example, the machine name for your SMTP service). As an advanced topic, these configuration properties can be specified in an initial deployment using sitedefault.yml. For more information, see "Automate Configuration Properties during Deployment (Ansible)" on page 11.

For a tenant within a multi-tenant environment, the services in the Basic services view can seem to be incomplete configuration instances (indicated by a half-filled red circle next to the configuration instance name). For security purposes, tenants cannot see configuration values that apply to other tenants. This means that the tenant administrator sees incomplete red icons, because administrators are not allowed to see a configuration for an item that does not apply to them. For more information, see "Manage Tenants" in SAS Viya Administration: Multi-tenancy.

What Services Must Be Restarted?

On a non-cloud platform, such as native Linux, whenever a change is made to a Java virtual machine (JVM) configuration property (a Java option), any services that rely on that property must be restarted. For information about how to restart one or more services, see “General Servers and Services: Operate (Linux)” in SAS Viya Administration: General Servers and Services.

If you change any properties that affect the cache, all services must be restarted in order for the change to take effect.

If you change configuration property values for any of the following services, you must restart the service:

- **SAS Cache Locator**
  - Red Hat Enterprise Linux 7.x (or an equivalent distribution) and SUSE Linux Enterprise Server 12.x:
    
    ```sh
    sudo systemctl restart sas-viya-cachelocator-default
    ```
  - Red Hat Enterprise Linux 6.x (or an equivalent distribution):
    
    ```sh
    sudo service sas-viya-cachelocator-default restart
    ```

- **SAS Cache Server**
  
  Note: If SAS Cache Server is restarted, a full restart is also required.

  ```sh
  sudo systemctl restart sas-viya-cacheserver-default
  ```

  ```sh
  sudo service sas-viya-cacheserver-default restart
  ```

- **SAS Configuration Server (Consul)**
  
  ```sh
  sudo systemctl restart sas-viya-consul-default
  ```

  ```sh
  sudo service sas-viya-consul-default restart
  ```
Red Hat Enterprise Linux 6.x (or an equivalent distribution):

```
sudo service sas-viya-consul-default restart
```

- **SAS Message Broker (RabbitMQ)**
  - Red Hat Enterprise Linux 7.x (or an equivalent distribution) and SUSE Linux Enterprise Server 12.x:
    
    ```
sudo systemctl restart sas-viya-rabbitmq-server-default
```

  - Red Hat Enterprise Linux 6.x (or an equivalent distribution):
    
    ```
sudo service sas-viya-rabbitmq-server-default restart
```

- **SAS Infrastructure Data Server (PostgreSQL)**

  For information, see “Operate a Cluster (Linux)” in *SAS Viya Administration: Infrastructure Servers*.

---

**Note:** You must be signed in to the machine where these services reside with sudo privileges to run these commands.

---

**See Also**

- “Start and Stop a Specific Server or Service” in *SAS Viya Administration: General Servers and Services*

---

**How SAS Viya Configuration Works**

**Spring-Based Microservices**

For SAS Viya Spring-based microservices, property changes are made in SAS Environment Manager and stored in SAS Configuration Server. SAS Viya triggers a refresh, and the new property values are applied to the service. In most situations, no restart of the service is required.
Non-Spring-Based Servers

For SAS Viya, non-Spring-based servers, property changes are made in SAS Environment Manager and stored in SAS Configuration Server. A tool, such as the consul-template daemon, extracts the configuration change from SAS Configuration Server and updates the appropriate service configuration file. Some servers, such as SAS Infrastructure Data Server, require you to manually restart them for their configuration changes to take effect.
Figure 3  How Configuration Properties Are Updated (Non-Spring-Based Servers)

1. Configuration property B is changed.

2. Configuration property B is updated in the SAS Configuration Server.

3. Depending on the server, a process, such as the consul-template daemon, writes a new configuration file for the server.

4. Some servers such as, SAS Infrastructure Data Server, require an admin to manually restart them.

Bulk Loading of Configuration Values (sitedefault.yml)

You can deploy SAS Viya with configuration values that are customized for your site by running your Ansible playbook with sitedefault.yml. When sitedefault.yml is present in the playbook roles/consul/files directory, Ansible copies it to the machines that contain the SAS Configuration Server (Consul). When the configuration server starts, the watch script invokes the sas-bootstrap-config CLI to bulk load the key-value pairs that are specified in sitedefault.yml.

For more information, see “Automate Configuration Properties during Deployment (Ansible)” on page 11.
Note: The sas-bootstrap-config CLI uses a *check and set policy*. If a property currently exists in the configuration server, the CLI does not update the property. Therefore, it is extremely important that the initial values applied with sitedefault.yml are correct. After you specify a value with sitedefault.yml, you cannot re-run sitedefault.yml to change that value. You can re-run sitedefault.yml only to specify properties that have not already been specified. To change properties specified with sitedefault.yml, you must use the sas-bootstrap-config CLI directly, or use another administration interface, such as SAS Environment Manager.

**Figure 4  How Configuration Properties Are Updated (Non-Spring-Based Services)**

### SAS Studio 5.2 (Enterprise) and 5.2 (Basic) Administration Differences

**Overview**

SAS Viya 3.5 includes two releases of SAS Studio:
SAS Studio 5.2 (Basic) is used in programming-only deployments. SAS Studio 5.2 (Basic) is an embedded web application that does not rely on external services. Therefore, SAS Studio 5.2 (Basic) has relatively few dependencies, such as a SAS Object Spawner and SAS Workspace Server.

SAS Studio 5.2 (Enterprise) is itself a microservice and provides functionality by relying on SAS Configuration Server, SAS Message Broker, SAS Infrastructure Data Server, and other microservices. For this reason, SAS Studio 5.2 (Enterprise) is available only in full deployments of SAS Viya.

Authentication Differences

SAS Studio 5.2 (Basic) uses host authentication such as Pluggable Authentication Modules (PAM) and Integrated Windows Authentication (IWA) to authenticate users. For more information, see "Authentication for Programming Interfaces" in SAS Viya Administration: Authentication.

SAS Studio 5.2 (Enterprise) authentication fully integrates with the features provided by SAS Logon Manager, and provides more authentication possibilities, such as the following:

- LDAP provider
  - standard user name and password form.
- Kerberos or Integrated Windows Authentication (IWA)
  - single sign-on from the client host to the visual interfaces.
- Security Assertion Markup Language (SAML) provider
  - single sign-on from third-party provider.
- OAuth and OpenID connect provider
  - single sign-on from third-party provider.
- Pluggable Authentication Modules (PAM)
  - multi-factor authentication via third-party tools.
- SAS 9.4
  - single sign-on from SAS 9.4.

For more information, see "Authentication for Visual Interfaces" in SAS Viya Administration: Authentication.
Accessing SAS Content

SAS Studio 5.2 (Enterprise) enables you to access both folders and items in the native file system and the folders and items in the SAS Content area.

**SAS Content** is shared across all SAS Viya applications and managed by the SAS Drive web application.

*Note:* Files of type *.sas7bdat are not supported in the SAS Content folder.

SAS Studio 5.2 (Basic) enables you to access only the folders and items in the native file system.

Improved Recovery

Previous releases of SAS Studio can be clustered for scalability and high availability, providing multiple instances of the web application. However, before SAS Studio 5.2 (Enterprise), end-user sessions were bound to a specific instance known as a “sticky session.”

To understand the disadvantages of a sticky session, consider the following example. Suppose that you have two SAS Studio 5.2 (Basic) instances running on server1 and server2. When you sign in to SAS Studio 5.2 (Basic), the front-end load balancer directs you to server2. Until you sign out, your session remains on server2. If server2 abnormally shuts down—even though server1 is unaffected—your session is lost and you must sign out, possibly losing your work. When you sign in again, the load balancer redirects you to the available server, in this case, server1.

There is also another, more subtle issue. Each instance of SAS Studio 5.2 (Basic) can access only an object spawner and workspace servers running locally on the same machine. Suppose that all SAS Studio 5.2 (Basic) instances are running fine, but the object spawner on server2 goes down. Even if your SAS Studio 5.2 (Basic) session is unaffected, you are unable to perform any work. If you decide to sign out and back in, there is a chance that you will again be routed to server2, because the load balancer continues to see SAS Studio 5.2 (Basic) running on server2.

SAS Studio 5.2 (Enterprise) solves all these issues. Because it is a stateless microservice, Studio 5.2 (Enterprise) end-user sessions are not bound to any specific instance. If one instance stops abnormally, SAS Studio 5.2 (Enterprise) continues working using another microservice instance. Also, to run SAS code, SAS Studio 5.2 (Enterprise) does not use an object spawner and workspace server. Instead, Studio 5.2 (Enterprise) submits code to a compute server started by a launcher server. The compute and launcher server infrastructure ensures that there are no dependencies to a specific server machine. Therefore, SAS Studio 5.2 (Enterprise) can use a launcher and compute server located on any machine.

Architectural Comparison

To understand the architectures of SAS Studio 5.2 (Basic) and 5.2 (Enterprise) compare these diagrams:

- full deployment (SAS Studio 5.2 (Enterprise))
Configuration Properties: Reference (Services)

Application Registry Service

The Application Registry service registers applications to enable integration with SAS Drive and with the Application Switcher (side menu).

sas.appregistry
   The set of configuration properties for the Application Registry service.
      supplementalProperties
         The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

Audit Service

The Audit service provides a framework for reporting on audit events.

sas.audit.archive
   The set of properties that are used to archive audit records.
      batchSize
         The number of audit records to process in a single batch during an archive request.
      enabled
         Enables archiving of audit records.
      localRetention
         The retention period for persisting audit records within the service.
      scanSchedule
         The schedule that determines when an archive request is initiated.
      storageType
         The external storage mechanism to use for archiving audit records. Must be set to 'none' or 'local'.
         storage.local.destination
            The file location to use when 'storageType' is set to 'local'.

sas.audit.record
   The set of properties that are used to control how audit events are recorded.
resource.enabled
Specifies whether to collect audit records for resource events. Valid values are true and false. The default value is true.

resource.action.read.state
Specifies whether to collect success or failure records for resource events. Valid values are success and failure. The default value is failure.

security.enabled
Specifies whether to collect audit records for security events. Valid values are true and false. The default value is true.

security.action.read.state
Specifies whether to collect success or failure records for security events. Valid values are success and failure. The default value is failure.

application
Customizable properties to control which application-specific audit events are recorded.

Authorization Service

The Authorization service provides the general authorization system.

sas.authorization
The set of configuration properties for the Authorization service.

maxAncestryCacheSize
Specifies the maximum number of ancestors to cache per object. The default value is 1000. The cache enhances performance in container-based inheritance.

reshareEnabled
Specifies whether resharing is enabled. When set to off, prevents downstream sharing by users who lack Secure access to the object that is being shared. The default value is on. See “Sharing: Details for Administrators” in SAS Viya Administration: General Authorization.

Note: If sharingEnabled is off, specifying this property has no effect.

Note: You cannot enable or disable downstream sharing on a per-object or per-identity basis. The ability to perform downstream sharing is controlled only by this deployment-wide configuration property.

sharingEnabled
Specifies whether sharing is enabled. When set to off, prevents all sharing. The default value is on. See “Sharing: Details for Administrators” in SAS Viya Administration: General Authorization.

rules.executorThreads (a supplemental property.)
Specifies the number of threads that are available for bulk processing of authorization rules. The default value is 20. Modify this value only if you are directed to do so by SAS Technical Support.

remote (a supplemental property.)
Disables enforcement in the general authorization system, if set to false. The default value is true. An administrator might temporarily disable authorization if rules that inadvertently prevent access are introduced. Do not disable authorization while the system is available to other users.
warnOnCycles (a supplemental property.)
Prevents cyclic warnings from being written to the authorization service log, if set to false. The
default value is true. An administrator might temporarily set this property to false if cyclic
warnings are causing the log to grow rapidly. After cyclic rules are corrected, set this property
back to true.

Backup Service

The Backup service manages the backup and recovery of configuration information and user-created
content in a SAS deployment.

sas.deploymentbackup
The set of configuration properties for the Backup service.

agentType

IMPORTANT  This property is deprecated. Do not use this property.

The type of communication (messaging or SSH) that is used between the Backup service and the
Backup agent.

jobTimeout
The number of minutes a backup job or a restore job is allowed to run before the job is marked
'Failed.'

retentionPeriod
The number of days that backups are stored before they are removed from the backup vault.

scheduledBackupAllowed

IMPORTANT  This property is deprecated. Do not use this property.

Allows scheduled backups to run. In this release, the default value is false and cannot be changed.

sharedVault
A network location where all the backups are stored. This location should be accessible to the
user identity installing deploymentBackup and backup-agent services.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

vaultLocation

IMPORTANT  This property is deprecated. Do not use this property.

The location where all backups are stored. In a multi-machine deployment, the install user must
have Read and Write permissions on every machine.
Cache Services

The Cache services provide other microservices the ability to distribute cached data across instances. The Cache services consist of both a Cache Locator and a Cache Server.

sas.cache.default

IMPORTANT The configuration definition, sas.cache.default, has been deprecated. Use instead, sas.cache.config.

sas.cache.config

The set of properties that provide customization for caching.

ackSevereAlertThreshold
  The number of seconds the distributed system waits after the ack-wait-threshold for an acknowledgment from a system member before sending a severe alert. A value 0 (zero) disables this feature.

ackWaitThreshold
  The number of seconds a distributed message waits for an acknowledgment from a system member before sending an alert.

conserveSockets
  Allows sockets to be shared by a system member's threads.

criticalHeapPercentage
  The percentage of Java old generation heap. When reached, prevents Write operations of cached data from occurring.

deployWorkingDir
  The working directory used when deploying JAR application files to distributed system members. This directory can be local and unique to the member, or it can be a shared resource.

disableAutoReconnect
  Disables the ability of a system member to reconnect and re-initialize after it has been forced out of the distributed system.

diskStoreDir
  The directory used when region data is overflowed to disk. This directory can be local and unique to the member or can be a shared resource.

diskStoreOpLogSize
  The maximum size for a region overflow file when region data is overflowed to disk. The value is specified in Megabytes.

diskStoreSize
  The maximum amount of data on disk when region data is overflowed. The value is specified in megabytes.
distributedCache
   Specifies that the cache should be distributed. Valid values are true or false. SAS Cache Server requires the value true.

enableNetworkPartitionDetection
   Enables the distributed system to detect and handle splits in the distributed system. Splits are typically caused by a partitioning of the network (split brain) where the distributed system is running.

evictionHeapPercentage
   The percentage of Java old generation heap when reached, causes cached data to overflow to disk.

groups
   The list of groups that this system member belongs to. Use a comma to separate group names.

locatorDiscoveryAttempts
   The number of service discovery attempts allowed before a registered cache locator is found. A value of 0 (zero) allows for an unlimited number of attempts.

locatorWaitTime
   The number of seconds that a system member waits for a locator to join the distributed system.

logLevel
   Indicates the lowest diagnostic log level (TRACE, DEBUG, INFO, WARN, ERROR, and FATAL) that is processed. Log events whose levels are below the specified value are ignored.

maxConnections
   The maximum number of connections to pool when connected to a cache server.

membershipPortRange
   The port range used when selecting ephemeral ports for members of the distributed system. Values are 32768 to 61000.

memberTimeout
   The number of milliseconds the distributed system waits before it determines that a system member has timed out.

mode
   The mode of operation to use when connecting to the cache servers. Valid values are client or local. SAS Cache Server requires local.

overflowEnabled
   Allows cached data to overflow to disk in low memory situations.

persistentEnabled
   Allows cached data to persist to disk.

pingInterval
   The ping interval for the cache client to check the availability of servers in milliseconds.

retryAttempts
   The number of retry attempts for operations if a time-out or exception occurs.

subscriptionEnabled
   Configures the client to register with the cache server for subscription events.

tcpPort
   The TCP port a member of the distributed system listens on for cache communications.
Cache Locator Service

The Cache Locator service provides discovery information to SAS Viya microservices for the purpose of forming a distributed data cache. SAS Cache Locator is based on the open-source Apache Geode project.

sas.cache.locator

The set of properties that provide customization for the Cache Locator service.

host
The host where the service is deployed.

hostnameForClients
The external host name of the cache locator if different from the local bind address or host name.

port
The port registered for the cachelocator-listener.

retryCount
The number of attempts the service makes to register the cachelocator-listener.

retryPeriod
The amount of time between registration attempts for the cachelocator-listener.

timeout
The amount of time this service waits to start the locator process.

timeoutInterval
The amount of time between attempts checking for the start of the locator process.

Cache Server Service

The Cache Server service hosts long-lived data regions (a cache) and serves the contents to SAS Viya microservices. Like SAS Cache Locator, SAS Cache Server is based on the open-source Apache Geode project.

sas.cache.server

The set of properties that provide customization for the cache server.

autoStartup
Specifies whether the cache server should be started automatically on start-up.

host
The host where the service is deployed.

hostnameForClients
The external host name of the cache server if different from the local bind address or host name.

maxTimeBetweenPings
The maximum time in milliseconds between messages or a ping from a cache client.

port
The port registered for the cache server.
CAS Management Service

The CAS Management service provides access to shared data for users and applications. The service also provides information about the SAS Viya system for operations such as monitoring and auditing.

sas.casmanagement

The set of properties that are used to configure private values for the CAS Management service.

supplementalProperties
   The set of user-added, advanced properties.

   **Note:** Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

- The set of properties used for CAS manager.
  
  casManager.jobHeartbeatInterval
     Specifies the heartbeat value to use for CAS Manager jobs. Specify a value using the W3C XML duration format (for example, P7D=7 days, PT5M=5 minutes, PT8H=8 hours). The default value is PT5M. Specify PT0M to disable the heartbeat check.

  casManager.jobsExpireAfter
     Specifies the amount of time after job completion that the job is deleted. The default value is PT7D (7 days). Specify PT0D to disable job deletion.

- The set of properties used by datafile upload
  
  fileUpload.fileUploadEnabled
     Enables datafile upload.

  fileUpload.maxFileUploadSize
     The maximum size (in megabytes) of a datafile that can be uploaded. Specify a value of -1 for no limit.

sas.casmanagement.global

The set of properties that are used to configure global values for the CAS Management service.

The sas.casmanagement.global configuration instance applies to all SAS Viya servers and services (global).

- The set of properties used by applications to access shared data and analytics, such as map data.
  
  application.casServer
     The name of the CAS server used for application work.

  application.caslib
     The name of the caslib used for application data.

- The set of properties used to identify the default CAS server for users.
default.casServer
    The name of the default CAS server for users.

default.caslib
    The name of the default caslib for users.

default.loadedTableCopiesCount
    The number of copies of the table to make for fault tolerance when loading data. Larger values result in slower performance and use more memory but provide high availability of data in the event of a node failure.

- The set of properties used to identify the reference data.
  reference.caslib
    The name of the reference caslib.
  reference.TablesCopiesCount
    The number of redundant copies of the rows to make when saving data. Larger values provide greater fault tolerance for node failures but use more memory.

- The set of properties used by the system for data produced during normal operation, such as audit records and monitoring data.
  system.casServer
    The name of the system CAS server.
  system.caslib
    The name of the system caslib.
  system.tempTablesCopiesCount
    The number of extra copies of temporary tables.

Compute Service

The Compute service enables clients to submit SAS programs and stored procedures in the form of jobs for processing. The SAS Compute Server implements the Compute service. See “SAS Compute Server and Compute Service” in SAS Viya Administration: Programming Run-Time Servers.

sas.compute

The set of properties used to configure the compute and related servers.

domain.default
    The default authentication domain to use for looking up host credentials.
  kerberos.enabled
    Authenticate to compute servers using Kerberos.
  serviceAccount.default:
    The default service account that should be used to run jobs on the host.
Files Service

**sas.files**
- **blockedTypes**
  Specifies blocked file types.
- **extractionLimit**
  Size of file in bytes to be extracted using the tika extension for indexing. The default value is 5,000.
- **maxFileSize**
  Maximum size of file in bytes to be uploaded. The default value is 104857600. The maximum value is 2147483647
- **securedTypes**
  Specifies secured file types.

**sas.files.extraction**
- **largeFileSize**
  Size of file in bytes to be sent for extraction in the largeFileSize category using tika. The default value is 10485760 (10MB).
- **largeFileTypes**
  Specifies the types of files that will be considered for extraction in the largeFileSize category.
- **mediumFileSize**
  Size of file in bytes to be sent for extraction in the mediumFileSize category using tika. The default value is 5242880 (5MB).
- **mediumFileTypes**
  Specifies the types of files that will be considered for extraction in the mediumFileSize category.
- **smallFileSize**
  Size of file in bytes to be sent for extraction in the smallFileSize category using tika. The default value is 2621440 (2.5MB).
- **smallFileTypes**
  Specifies the types of files that will be considered for extraction in the smallFileSize category.

**sas.security**
- **network.databaseTraffic.enabled**
  Specifies that security is enabled for database traffic.
- **network.sasData.enabled**
  Specifies that security is enabled for SAS traffic.
- **network.serverControl.enabled**
  Specifies that security is enabled for server control.
- **network.web.enabled**
  Specifies that security is enabled for web-based traffic.

**sas.files.scan**
- ClamAV is currently the only antivirus application supported for SAS Viya. After you install the service using the instructions in the ClamAV documentation, you must use these properties to enable the application to work with the SAS Viya Files service.

You must also ensure that the value for the ClamAV property `StreamMaxLength`, which is specified in the `clamd.conf` file, is equal to or greater than the value for the File service property `maxFileSize`. See "maxFileSize" on page 30.
antivirusConnectionTimeout
Specifies the time-out value (in milliseconds) when reading from the antivirus application.

antivirusHost
Specifies the host address at which the antivirus application is installed. You must specify this property in order to enable the antivirus application.

antivirusPort
Specifies the port on which the antivirus application is listening. The default value is 3310, which is the default port for the ClamAV application. You must specify this property in order to enable the antivirus application.

antivirusScanEnabled
Specifies that files that are uploaded by the Files service are scanned by the antivirus application. You must set this property to True in order to enable the antivirus application.

Notifications Service
The Notifications service stores and retrieves system and application event notifications. There are two types of notifications, subscription-based (also known as opt-in notifications) and directed (explicit notifications).

You can manage subscription-based notifications using the Notifications service. Directed notifications are managed by the SAS applications that use them (such as SAS Workflow Manager).

sas.notifications
The set of properties used to control subscription-based (opt-in) notifications.

enabled
   Enables opt-in notifications on all channels.

   IMPORTANT Turning off sas.notifications.enabled, turns off all subscription-based notification channels, such as notifications in SAS Viya web applications' banner and email notifications.

sas.notifications.delivery
The set of properties used to control subscription-based (opt-in) notifications on specific delivery channels.

mail.enabled
   Enables opt-in notification delivery to the email channel.

   IMPORTANT To enable subscription-based notifications to email, sas.notifications.enabled must be on (TRUE).
CAS Proxy Service

The set of configuration properties for the CAS Proxy service.

jobExecutionProvider

Configurable values for the CAS language (CASL) job execution provider job.

caslJESExpiresAfter
The amount of time after job completion before the job execution service deletes the job. Specify time in W3C XML duration format (for example, PT5M = 5 minutes). A null value indicates that job is not deleted.

caslJESHeartbeatInterval
The heartbeat value (in seconds) to use with a CASL job execution provider job. A zero or negative value indicates that the heartbeat is not checked.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

Configuration Service

The Configuration service manages changes to the configuration of services. See “Configuration Properties: Concepts” on page 13.

sas.configuration
The set of configuration properties for the Configuration service.

forceWrite.enabled
Enables writing to the persistence layer for every operation even when that operation made no changes.

locking.enabled
Enables locking between multiple instances of the SAS Configuration Service. Locking must be enabled when more than one SAS Configuration Service instance is present in the deployment.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.
Cross Domain Proxy Service

The Cross Domain Proxy service provides access to external web resources over HTTP.

sas.crossdomainproxy

The set of configuration properties for the Cross Domain Proxy service.

allowedDomains

The list of domains (an allowlist) that the cross-domain proxy is allowed to access. The value is a Java regular expression. Use the Or character (|) to separate multiple domains (for example, https://*\./sas\./com(:\d+)?|https://*\./foo\./bar\./org/).

**TIP** SAS recommends that you escape dot (.) characters in regular expressions with a slash (\) (for example, *\./sas\./com). Also, add a trailing forward slash (/) with each domain (for example, *\./sas\./com/).

allowSystemDomains

Enables the list of trusted domains (if any) required by SAS. If the cross-domain proxy is denied access to one or more of these domains, certain SAS features are disabled. (This list of trusted domains is displayed in the property description in SAS Environment Manager.)

sas.crossdomainproxy.system

The set of system configuration properties for the Cross Domain Proxy service.

connectionTimeoutInMinutes

The number of minutes allowed before the connection to the HTTP client times out. A value of zero (0) specifies no time-out.

excludeRequestHeaders

The list of header names (a denylist) which the cross-domain proxy excludes from requests sent to a destination URL. The value is a Java regular expression. Use the Or character (|) to separate multiple header names (for example, cookie|Authorization).

maxPooledConnections

The maximum number of total pooled connections. (This value must be a positive integer.)

maxPooledConnectionsPerRoute

The maximum number of pooled connections per route. (This value must be a positive integer.)

Device Management Service

The Device Management service provides the means to maintain the server’s device denylist and allowlist tables, including controlling which security model is in place. See *SAS Viya Administration: Mobile*. 
sas.devicemanagement
The set of configuration properties for the Device Management service.

offlineLimitDays
The number of days before the mobile application goes off-line.

passcodeAttempts
The number of passcode attempts before the user is locked out of the mobile application.

passcodeTimeoutMinutes
The number of minutes before the passcode expires on the mobile application.

whitelistSupportEnabled
Enables allowlist support for mobile device security on the server.

Identities Service
The Identities service retrieves information about identities (users or groups) from your identity provider. It also enables the creation and management of custom groups. For detailed information about this functionality, see SAS Viya Administration: Identity Management. Here are the configuration properties for the Identities service:

sas.identities
The set of properties that are used to configure global values for the Identities service.

cache.cacheRefreshInterval
The refresh interval for the identities cache.

Note: Do not specify cache.cacheRefreshInterval below 20 minutes. Doing so might have a significant impact on your overall system, especially on the LDAP and SAS Infrastructure Data (PostgreSQL) servers.

Use the following conventions to specify the unit of time for the refresh interval:

- d - refers to days (for example, 6d).
- h - refers to hours (for example, 6h).
- m - refers to minutes (for example, 6m).
- s - refers to seconds (for example, 6s).
- ms - refers to milliseconds (for example, 6ms).

cache.enabled
Enables identities information to be cached. Caching is enabled by default.

cache.providerPageLimit
The number of identities to process in a given request when loading the cache. The default value is 1000.

defaultProvider
The default provider. The default value is local. (For this release, SAS recommends that you do not change this value.)
sas.identities.providers.ldap

The set of properties that are used to configure your LDAP provider.

**IMPORTANT** The set of properties for sas.identities.providers.ldap are global values that apply to all LDAP configurations. For multi-tenancy, these global settings apply to the provider and all tenants.

- **followReferrals**
  Enables referrals to other servers or domains to be followed automatically.

- **membershipCacheRefreshInterval**
  Specifies the interval that is used to refresh the membership cache for the LDAP provider. The default value is 6h.

- **pagedResults**
  Enables the LDAP server to use pagination when processing requests. Pagination is enabled by default.

- **pageSize**
  The number of identity requests per page to be processed by the LDAP server (if pagination is enabled). The default value is 500.

- **primaryGroupMembershipEnabled**
  Enables processing of primary group memberships (used only for posixGroup schema).

sas.identities.providers.ldap.connection

The set of properties that are used to configure your LDAP provider.

- **anonymousBind**
  Specifies whether Read-Only operations are performed using an anonymous (unauthenticated) context.

- **customEnvironmentProperties**
  The set of user-added, advanced properties for configuring the LDAP client environment.

  Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

- **host**
  The host name of the LDAP server to connect to.

- **password**
  The password for logging on to the LDAP server. If anonymousBind is enabled, specify a value of none.

- **pool.enabled**
  Enables pooling of LDAP connections. Pooling is enabled by default.

- **pool.evictionTimePeriodMillis**
  The number of milliseconds that the idle-object evictor thread sleeps between runs. If the value is non-positive, the idle object evictor thread does not run. The default value is 240000.
pool.idleTimeMillis
The minimum amount of time in milliseconds that objects can sit idle in the pool before becoming eligible for eviction by the idle-object evictor, if present. The default value is 480000.

pool.maxActive
The maximum number of active connections of a given type (either Read-Only or Read-Write) that can be allocated from the pool at the same time. The default value is 8.

pool.maxIdle
The maximum number of active connections of a given type (either Read-Only or Read-Write) that can remain idle in the pool without extra connections being released. For no limit, specify a non-positive value. The default value is 8.

pool.maxSize
The maximum number of active connections of all types that can be allocated from the pool at the same time. For no limit, specify a non-positive value. The default value is -1.

pool.maxWait
The maximum amount of time in milliseconds that the pool waits for a connection to be returned before throwing an exception. For no limit, specify a non-positive value.

pool.minIdle
The minimum number of active connections of a given type (either Read-Only or Read-Write) that can remain idle in the pool without extra connections being created. To create no extra connections, specify zero. The default value is 0.

pool.testOnBorrow
Enables validation of objects before they are borrowed from the pool. If an object fails validation, it is dropped from the pool and an attempt is made to borrow another object. This option is enabled by default.

pool.testOnReturn
Enables validation of objects before they are returned to the pool. This option is disabled by default.

pool.testWhileIdle
Enables validation of objects by the idle-object evictor, if present. If an object fails validation, it is dropped from the pool. This option is enabled by default.

pool.whenExhaustedAction
An integer that indicates the behavior when the pool is exhausted. Valid values are: 0 (fail), 1 (block), or 2 (grow).

port
The port for connecting to LDAP.

Note: When connecting via LDAP, port values are set to 389. When connecting via Lightweight Directory Access Protocol over TLS (LDAPS), port values are set to 636.

startTLS.mode
When using StartTLS, which mode to enable. The possible values are none (default) or simple. This property is case-sensitive.

url
The URL for connecting to LDAP.

The default is: url: ldap://${sas.identities.providers.ldap.connection.$host}:${sas.identities.providers.ldap.connection.port}

When the host and port properties have been specified, the url must be changed if you are connecting via the LDAPS protocol.
userDN
The distinguished name (DN) of the user account for logging on to the LDAP server (for example, cn=AdminUser,dn=example,dn=com). If anonymousBind is enabled, specify a value of none.

sas.identities.providers.ldap.group (Field Mappings)
The set of properties that are used to configure the mapping of group-level fields in your LDAP provider to group-level fields in SAS. For each of the following SAS fields, you specify the corresponding field in your LDAP provider. The default values are valid for most implementations of Microsoft Active Directory. For other LDAP providers, you must provide different values for some fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default (valid for most implementations of Microsoft Active Directory)</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>The field in the LDAP provider that is used to populate the group’s ID.</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>createdDate</td>
<td>The field in the LDAP provider that is used to populate the group’s account created date.</td>
<td>whenCreated</td>
</tr>
<tr>
<td>description</td>
<td>The field in the LDAP provider that is used to populate the group’s description.</td>
<td>description</td>
</tr>
<tr>
<td>member</td>
<td>The field in the LDAP provider that is used to populate the members of the group.</td>
<td>member</td>
</tr>
<tr>
<td>memberOf</td>
<td>The field in the LDAP provider that is used to populate the groups that this group is a member of. Set memberOf to none if the LDAP group attribute is not a fully qualified DN value.</td>
<td>memberOf</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>The field in the LDAP provider that is used to populate the date on which the group’s account was last modified.</td>
<td>whenChanged</td>
</tr>
<tr>
<td>name</td>
<td>The field in the LDAP provider that is used to populate the group’s name.</td>
<td>displayName</td>
</tr>
<tr>
<td>objectClass</td>
<td>The object class value to use when loading groups.</td>
<td>group</td>
</tr>
</tbody>
</table>

sas.identities.providers.ldap.group (Additional Properties)
The set of properties that are used to configure information for retrieving group information from your LDAP provider.
**baseDN**
The point from which the LDAP server searches for groups (for example, `ou=groups,dc=example,dn=com`).

**distinguishedName**
The field in the LDAP provider that is used to populate the group’s distinguished name value.

**Note:** If your LDAP server does not support an explicit distinguished name attribute (for example, OpenLDAP), you must set this property to `none`.

**objectFilter**
The filter for customizing results that are returned when groups are queried. The default filter is `(objectClass=group)`.

You can create a custom filter to exclude identities whose accounts are disabled or expired, or to exclude objects that represent computer resources rather than actual groups. If you have a large number of groups, using a custom filter can improve performance and reduce memory requirements. In addition, user management tasks can be performed more efficiently if only relevant identities are listed in SAS Environment Manager.

**searchFilter**
The filter that is used to find a group account. The default filter is `${sas.identities.providers.ldap.group.accountId}={0}`.

### sas.identities.providers.ldap.user (Field Mappings)
The following properties specify the mapping of user-level fields in your LDAP provider to user-level fields in SAS. For each of the following SAS fields, you specify the corresponding field in your LDAP provider. The default values are valid for most implementations of Microsoft Active Directory. For other LDAP providers, you must provide different values for some fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default (valid for most implementations of Microsoft Active Directory)</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>The field in the LDAP provider that is used to populate the user’s ID.</td>
<td>sAMAccountName</td>
</tr>
<tr>
<td>address.country</td>
<td>The field in the LDAP provider that is used to populate the user’s country.</td>
<td>co</td>
</tr>
<tr>
<td>address.locality</td>
<td>The field in the LDAP provider that is used to populate the user’s city.</td>
<td>I</td>
</tr>
<tr>
<td>address.postalCode</td>
<td>The field in the LDAP provider that is used to populate the user’s postal code.</td>
<td>postalCode</td>
</tr>
<tr>
<td>address.region</td>
<td>The field in the LDAP provider that is used to populate the user’s region or state.</td>
<td>region</td>
</tr>
<tr>
<td>address.street</td>
<td>The field in the LDAP provider that is used to populate the user’s street address.</td>
<td>street</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
<td>Default (valid for most implementations of Microsoft Active Directory)</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------</td>
</tr>
<tr>
<td>createdDate</td>
<td>The field in the LDAP provider that is used to populate the user’s account created date.</td>
<td>whenCreated</td>
</tr>
<tr>
<td>description</td>
<td>The field in the LDAP provider that is used to populate the user’s description.</td>
<td>description</td>
</tr>
<tr>
<td>emailAddress.other</td>
<td>The field in the LDAP provider that is used to populate the user’s alternate email address.</td>
<td>otherMailbox</td>
</tr>
<tr>
<td>emailAddress.work</td>
<td>The field in the LDAP provider that is used to populate the user’s work email address.</td>
<td>mail</td>
</tr>
<tr>
<td>emailAddress.sms</td>
<td>The field in the LDAP provider that is used to populate the user’s SMS email address.</td>
<td></td>
</tr>
<tr>
<td>memberOf</td>
<td>The field in the LDAP provider that is used to populate the groups that this user is a member of.</td>
<td>memberOf</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>The field in the LDAP provider that is used to populate the date on which the user’s account was last modified.</td>
<td>whenChanged</td>
</tr>
<tr>
<td>name</td>
<td>The field in the LDAP provider that is used to populate the user’s name.</td>
<td>displayName</td>
</tr>
<tr>
<td>objectClass</td>
<td>The type of user objects that are being searched for.</td>
<td>organizationalPerson</td>
</tr>
<tr>
<td>phone.business</td>
<td>The field in the LDAP provider that is used to populate the user’s work phone number.</td>
<td>telephoneNumber</td>
</tr>
<tr>
<td>phone.businessFax</td>
<td>The field in the LDAP provider that is used to populate the user’s work fax number.</td>
<td>facsimileTelephoneNumber</td>
</tr>
<tr>
<td>phone.home</td>
<td>The field in the LDAP provider that is used to populate the user’s home phone number.</td>
<td>homePhone</td>
</tr>
<tr>
<td>phone.mobile</td>
<td>The field in the LDAP provider that is used to populate the user’s mobile phone number.</td>
<td>mobile</td>
</tr>
<tr>
<td>phone.pager</td>
<td>The field in the LDAP provider that is used to populate the user’s pager number.</td>
<td>pager</td>
</tr>
<tr>
<td>title</td>
<td>The field in the LDAP provider that is used to populate the user’s title.</td>
<td>title</td>
</tr>
</tbody>
</table>
sas.identities.providers.ldap.user (Other Properties)

The set of properties that are used to configure additional information for retrieving user information from your LDAP provider.

**baseDN**
The point from which the LDAP server searches for users.

**distinguishedName**
The field in the LDAP provider that is used to populate the user’s distinguished name value.

*Note:* If your LDAP server does not support an explicit distinguished name attribute (for example, OpenLDAP), you must set this property to `none`.

**objectFilter**
The filter for customizing results that are returned when querying users. The default filter is:

```
(&{objectCategory=person}{objectClass=user}
(!{userAccountControl:1.2.840.113556.1.4.803:=2}))
```

The default filter excludes identities that represent computers and identities that are inactive. This filter is compatible with Microsoft Active Directory.

You can create a custom filter to exclude identities whose accounts are disabled or expired, or to exclude objects that represent computer resources rather than actual users. If you have a large number of users, using a custom filter can improve performance and reduce memory requirements. In addition, user management tasks can be performed more efficiently if only relevant identities are listed in SAS Environment Manager.

For OpenLDAP, the filter `{objectclass=person}` excludes identities that represent resources other than users.

**searchFilter**
The filter used for locating a user account in the LDAP provider so that the user can make a connection using an ID and password.

The default filter is:

```
(&{{sas.identities.providers.ldap.user.accountId}={0}}
{{sas.identities.providers.ldap.user.objectFilter}})
```

sas.identities.providers.ldap.tenancy

The set of specific, multi-tenancy properties that can be used when implementing an LDAP provider.

**groupRdn**
The relative distinguished name group (RDN) value.

**tenantKey**
The default value (OU) for tenantKey.

**IMPORTANT** The purpose of sas.identities.providers.ldap.tenancy is for a default tenant configuration for a single, shared LDAP server. These properties are not used when customizing the structures for each tenant.
userRdn
The relative distinguished name user (RDN) value.

---

**Mail Service**

The Mail service provides a client the ability to send email to a configured SMTP server using a REST API.

For more information, see “Configure the Connection to the Mail Service” in *SAS Viya for Linux: Deployment Guide*.

```yaml
sas.mail
  The set of configuration properties for the Mail service.
    allowAllSenders
      Provides the ability to override restriction on the ‘from’ mail address allowed to send mail.
    fromAddress
      Default ‘from’ mail address to use when mail is sent directly from a service. (The default is noreplies@company.com.) For the report alert service, specify the property email.defaultFromAddress. See “email.defaultFromAddress” on page 43. For the report distribution service, specify the property defaultFromAddress. See “defaultFromAddress” on page 47.
    fromPersonalName
      Default personal name to use when mail is sent directly from a service. (The default is Service.)
    host
      The mail server host (machine).
    multipleMail
      Specifies whether separate mail is sent for each mail type.
    password
      The optional password for connecting to the mail server.
    port
      The mail server port. (The default is 25.)
    properties
      Optional properties specified on the remote mail server.
    sizeLimit
      The maximum size of mail sent to the configured mail server (in megabytes).
    username
      The optional user name for connecting to the mail server.
```

---

**Maps Service**

The Maps service returns polygon information for selected identifiers from a given table.

SAS Viya supports several third-party map services. Whether the map service uses HTTP or secured HTTP (HTTPS), depends on the following:

- OpenStreetMap
Controlled by the defaultOSMCommunicationProtocol configuration property.

- ArcGIS Online
  Controlled by SAS Visual Analytics, which always uses secure HTTP (HTTPS).

- local Esri server
  Controlled by the URL that is entered for the server protocol://host-name:port/path. The protocol that is entered is used.

**IMPORTANT** SAS Viya currently supports only token-based authentication for Esri. For example, an Esri server configured for Integrated Windows Authentication (IWA) is incompatible with SAS Viya.

If you use the SAS OpenStreetMap servers with an application such as SAS Visual Analytics, the machine on which the application runs must have access to these OpenStreetMap servers:

- opnsta.sas.com
- opnstb.sas.com
- opnstc.sas.com

All three servers use the standard port 80 for HTTP connections or port 443 for HTTPS connections. Do not specify the port number in your proxy configuration for the servers. However, if you do include the port number, queries to the servers that do not include the port number will fail. For example, if you configure the proxy to allow http://opnsta.sas.com:80, and an application sends http://opnsta.sas.com/mq_lite/0/0/0.png (without a port number), the query fails because the port number :80 was not included.

sas.maps
The set of configuration properties for the Maps service.

  customOSM.maxResolution
  The maximum resolution in meters per pixel of each map tile. The value must be a decimal number.

  customOSM.numResolutions
  The number of tile levels configured on the tile servers. The value must be a positive integer.

  customOSM.servers
  A comma-separated list of servers, with paths to tiles (for example, http://myhost1.myorg.com/tiles/, http://myhost2.myorg.com/tiles/).

  defaultOSMCommunicationProtocol
  The protocol (HTTP, HTTPS) that is used for the default OpenStreetMap servers.

  localEsriServicesRequiresAuthentication
  Indicates that the local Esri map services URL requires an authentication token for access.

  localEsriServicesUrl
  The URL to the local Esri map services. The URL consists of a protocol, host, port, and path (for example, http://myserver:6080/arcgis/rest/services/).

**Note:** If your on-premises Esri servers use a different network domain than your SAS Viya system, then you must add the necessary map URLs to the allowlist of domains that the cross-domain proxy is allowed to access. For more information, see "allowedDomains" on page 33.

supplementalProperties
The set of user-added, advanced properties.
**Monitoring Service**

The monitoring service provides information about the machines and services in your environment. See *SAS Viya Administration: Monitoring*.

`sas.monitoring`

The set of configuration properties for the Monitoring service.

**Report Alerts Service**

The Report Alerts service issues alerts for reports.

`sas.reportalerts.x`

The set of system configuration properties for the Report Alerts service.

**Note:** In a multi-tenant configuration, `sas.reportrenderer.system` properties apply to all tenants.

- `allowEvaluationAtStartup`
  Do not modify this property unless you are directed to do so by SAS Technical Support.

- `disabled`
  If true, disables report alerting evaluation. The default is false.

- `disableDataChangeCheck`
  If true, disables checking to determine whether data has changed. The default is false.

- `email.defaultFromAddress`
  Specifies the address from which report alerts are sent. If this value is invalid, the value of the `fromAddress` property of the Mail service is used. See “Mail Service” on page 41.

- `email.defaultFromName`
  Specifies the name from which report alerts are sent.

- `interval.evalIntervalMilliseconds`
  Specifies the pause inserted between iterations of all alerts for evaluation.

- `interval.maxEvalTimeMilliseconds`
  Specifies the maximum allowed interval time.

- `interval.maxWaitForAccessTokenSeconds`
  Do not modify this property unless you are directed to do so by SAS Technical Support.

- `interval.maxWaitForEvalCacheLockMilliseconds`
  Do not modify this property unless you are directed to do so by SAS Technical Support.
query.maxNumberOfSubscriptions
Specifies the maximum number of subscriptions to be returned for evaluation. The returned subscriptions start with the oldest since the last time they were queried.

query.maxWaitToRunSynchronizedQueryMilliseconds
Do not modify this property unless you are directed to do so by SAS Technical Support.

supplementalProperties
  - defaultEmailNotificationInterval
  - defaultNotificationInterval (specifies the evaluation interval, which is how frequently the system makes a determination about whether the alert’s conditions have been met)
  - defaultNotificationIntervalUnit (specifies the units for the notification interval)
  - defaultSmsNotificationInterval

  Note: Do not modify this property unless you are directed to do so by SAS Technical Support.

  - maxRetriesFailedEvaluations
  - useDebugEmailTemplate

  Note: Do not modify this property unless you are directed to do so by SAS Technical Support.

threadPool.coreSize
Specifies the pool core size of the thread pool.

threadPool.idleTimeoutSeconds
Specifies the maximum amount of time that a thread can be idle before it is taken off of the thread pool.

threadPool.maxSize
Specifies the maximum size of the thread pool.

threadPool.queueSize
Specifies the size of the thread pool queue.

---

Report Data Service

The Report Data service retrieves data from reports.

sas.reportdata.system
The set of system configuration properties for the Report Data service.

  Note: In a multi-tenant configuration, sas.reportdata.system properties apply to all tenants.

supplementalProperties
The set of user-added, advanced properties.

  Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.
executorExpirationIntervalMinutes
The number of minutes before inactive data executor sessions are closed if they have no active queries.

executorForceExpirationIntervalMinutes
The number of minutes before inactive data executor sessions are forced closed even if they have active queries.

minTimeSensitivityForCaching
The minimum time sensitivity of queries for caching. Results that are valid for equal to or longer than the selected value are cached.

packageResultFileTimeToIdleSeconds
The number of seconds allowed for a client to retrieve package result data files before the files are removed from the cache.

resultCacheErrorExpirationSeconds
The number of seconds before the error cases for a report result are removed from the cache.

resultCacheTimeToLiveSeconds
The number of seconds before a report result is removed from the cache.

tempCacheTimeToIdleSeconds
The number of seconds allowed for a client to retrieve temporary result data files before the files are removed from the cache.

xmlParserPoolSize
The number of XML parsers to be instantiated during application start-up.

sas.reportdata.properties
The set of configuration properties for the Report Data service.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

comparisonEpsilon
The number in E notation that is the variability allowed when comparing floating point numbers for equality.

decisionTreePredictorCardinalityLimit
The maximum cardinality of independent variables allowed to run a decision tree.

decisionTreeResponseCardinalityLimit
The maximum cardinality of a dependent variable allowed to run a decision tree.

defaultInteractiveDrillDepth
The number of interactive drill levels included in the offline data for report viewers.

defaultMaxCellsProduced
The maximum number of data cells delivered for each query result to report viewers.

enableResultCache
Enable report result caching.

exportExcelRowLimit
The maximum number of rows allowed for export files formatted for Excel.

exportExcelColumnLimit
The maximum number of columns allowed for export files formatted for Excel.
exportTSVandCSVRowLimit
The maximum number of rows allowed for tab- and comma-separated export files.

exportTSVandCSVColumnLimit
The maximum number of columns allowed for tab- and comma-separated export files.

ignoreMissingValuesInCountDistinct
Ignore missing values in count distinct.

maxTiesToIncludeOnRank
The maximum number of ties allowed for a rank.

modelingClassCardinalityLimit
The maximum number of class values allowed to run on fit models.

modelingGroupByCardinalityLimit
The maximum number of group by values allowed to run on fit models.

socketTimeoutLiveCancellableMillis
The number of milliseconds allowed for executing live, cancelable data queries.

socketTimeoutLiveNonCancellableMillis
The number of milliseconds allowed for executing live, non-cancellable data queries.

socketTimeoutSubscribeMillis
The number of milliseconds allowed for executing subscribe data queries.

A map of the maximum result rows values for the supported visual types.

maxRowsLookup.bubble
The maximum result rows for a bubble visual.

maxRowsLookup.buttonBar
The maximum result rows for a button bar visual.

maxRowsLookup.crossTab
The maximum result rows for a multidimensional table visual.

maxRowsLookup.customContent
The maximum result rows for a custom content.

maxRowsLookup.dropdown
The maximum result rows for a drop-down control.

maxRowsLookup.dualAxisTimeSeries
The maximum result rows for a dual axis time series visual.

maxRowsLookup.geoBubble
The maximum result rows for a geo bubble visual.

maxRowsLookup.geoContour
The maximum number of result rows for a geo contour visual.

maxRowsLookup.geoHeatmap
The maximum result rows for a geo heat map visual.

maxRowsLookup.geoRegion
The maximum result rows for a geo region visual.

maxRowsLookup.geoScatter
The maximum result rows for a geo scatter visual.

maxRowsLookup.graphDefault
The maximum result rows for a default graph visual.

maxRowsLookup.heatbox
The maximum result rows for a heat box visual.
maxRowsLookup.heatmap
The maximum result rows for a heat map visual.

maxRowsLookup.kpi
The maximum result rows for a key performance indicator (KPI) visual.

maxRowsLookup.list
The maximum result rows for a list visual.

maxRowsLookup.listTable
The maximum result rows for a list table visual.

maxRowsLookup.scatter
The maximum result rows for a scatter visual.

maxRowsLookup.textInput
The maximum result rows for a text input control.

maxRowsLookup.timeSeries
The maximum result rows for a time series visual.

maxRowsLookup.treeMap
The maximum result rows for a treemap visual.

maxRowsLookup.wordCloud
The maximum result rows for a word cloud visual.

sas.reportdata.debug
The set of debug configuration properties for the Report Data service.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

---

Report Distribution Service

The Report Distribution service distributes reports.

sas.reportdistribution.mail
The set of system configuration properties for the Report Distribution service.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

defaultFromAddress
Specifies the address from which reports are distributed. If this value is invalid, the value of the fromAddress property of the Mail service is used. See “Mail Service” on page 41.

eemail.defaultFromName
Specifies the name from which report alerts are sent.
Report Images Service

The Report Images service handles the images used in reports.

sas.reportimages.config
The set of system configuration properties for the Report Images service.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

localeSensitiveThumbnails
Specifies whether images thumbnails are locale-sensitive. By default, this property is set to 0 (which indicates that thumbnails are no locale-sensitive) to improve performance.

Report Packages Service

The Report Packages service executes reports to generate corresponding report packages. A report package includes the report.xml, CSS style sheets, images, CSV data files, and so on, that are used to render the report.

sas.reportpackages.system
The set of system configuration properties for the Report Packages service.

Note: In a multi-tenant configuration, sas.reportpackages.system properties apply to all tenants.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

backgroundThreadMonitorSecs
The frequency in seconds at which the background thread monitor runs. A value of zero indicates that the monitor is disabled.

packageExpirationTime
The amount of time in seconds after which the report package expires from the cache.

useProxyServiceForExternalImages
Enable the Cross Domain Proxy service to retrieve the external images in the report.

xmlParserPoolSize
The number of XML parsers to be instantiated during application start-up.

sas.reportpackages.properties
The set of configuration properties for the Report Packages service.
supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

highContrastTheme
The name of the theme to be used when reports are displayed in high contrast.

imageDefaultMaxBytes
The maximum number of bytes for an image. Larger images are scaled down, unless 'noscale' is specified in the report.

subscribeConcurrentRequestLimit
The maximum number of report packages that can be generated concurrently per user.

subscribeConcurrentRequestLimitGuest
The maximum number of report packages that can be generated concurrently for the Guest user.

sas.reportpackages.debug
The set of debug configuration properties for the Report Packages service.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

Report Renderer Service

The Report Renderer service creates PDF documents from report packages.

sas.reportrenderer.system
The set of system configuration properties for the Report Renderer service.

Note: In a multi-tenant configuration, sas.reportrenderer.system properties apply to all tenants.

cacheDuration
The number of seconds allowed before rendered reports are deleted from the cache.

workingDirectory
Override the working directory used for building rendered reports.

supplementalProperties
The set of user-added, advanced properties.

Note: Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

sas.reportrenderer.properties
The set of configuration properties for the Report Renderer service.
timeoutMillis
The number of milliseconds allowed before the rendering process times out.

footerContentFormatted
The HTML formatted footer to be included on each PDF rendered page.

The following rules apply to the footer definition:
- The footer definition must consist of one or more HTML `<span>` elements. The spans cannot be nested.
- You can use the `style=` attribute in the `<span>` element to specify formatting for the text in the span.
- The following Cascading Style Sheets (CSS) attribute values are supported:
  - `color:`
    - Values must be specified with hexadecimal representation (for example, #000000 for black).
  - `font-family:`
    - Values must be available font or font family names (for example, sans).
  - `font-style:`
    - Supported values are normal or italic.
  - `font-size:`
    - Values must be specified in pt units (for example, 10pt).
  - `font-weight:`
    - Supported values are normal or bold.
  - `text-decoration:`
    - Supported values are underline or none.
- You can use the `<br />` element between spans to force a line break.

Here is a sample footer definition:

```
  <span style="font-weight: bold;">Company Confidential.</span><br />
  <span style="font-style: italic; font-size: 10pt;">This document contains sensitive information.</span>
```

forcePDFAccessibleTags
Force all generated PDF files to include accessibility information (tagged PDF). Setting to true overrides the user-level enablePdfAccessibleTags option.

webContentRendererLink
The URL to a service that is set up to provide images for printing of web content.

Note: In order for web content to be included when you print a report, you must set up an application to provide images for the web content. A third-party tool such as Rendertron (https://github.com/GoogleChrome/rendertron) is one option that can be installed and configured to generate such images dynamically using Headless Chrome.

The Report Renderer service supports URLs with the following substitution tokens: __WebContentURL__, __ImageWidth__, and __ImageHeight__.
__WebContentURL__ is a token that the Report Renderer service substitutes with the web content URL found in the report. The Report Renderer service substitutes __ImageWidth__, and __ImageHeight__ with the requested image size, as allocated by the report layout.
**Note:** `webContentRendererLink` supports only standard web content (that is, content that does not require data or authentication). For this reason, data-driven content and SAS stored processes are not supported and cannot be rendered when printing reports in this release.

You must add this domain to the cross-domain proxy allowlist using the `sas.crossdomainproxy.allowedDomains` property. For more information, see “`sas.crossdomainproxy`”.

Here is an example:

```
http://my-server.example.com:3000/screenshot/__WebContentURL__?
width=__ImageWidth__&height=__ImageHeight__
```

**supplementalProperties**
The set of user-added, advanced properties.

**Note:** Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

**sas.reportrenderer.debug**
The set of debug configuration properties for the Report Renderer service.

**supplementalProperties**
The set of user-added, advanced properties.

**Note:** Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

---

**Secret Manager Service**

The Secret Manager service manages certificates generated by and stored by HashiCorp Vault. Vault provides a secure interface to secrets. These connections are secured by a Public Key Infrastructure (PKI) based on HashiCorp Vault, which is configured by SAS. The certificates are all signed by a Vault-generated root CA and intermediate certificate.

**sas.vault**
The set of configuration properties used to configure SAS Secret Manager (Vault).

**IMPORTANT** When modifying `sas.vault.*_ttl` properties, you must not violate precedence rules or SAS Secret Manager does not start. For more information, see “TTL Precedence Rules” in SAS Viya Administration: Infrastructure Servers.

**certificate_role**
Role of the certificates.

**certificate_role_allow_any_name**
The common name represents the name protected by the TLS certificate. Any name is allowed for the common name. The certificate is valid only if the requested host name matches the certificate
common name. It consists of a single host name (for a single-name certificate) or a wildcard name (for a wildcard certificate, *.example.com).

certificate_role_key_bits
The key-length (in bits) of the certificate generated from Vault.

certificate_role_key_type
The certificate encryption algorithm. RSA or Elliptic-Curve (EC) can be specified.

certificate_role_key_usage
A comma-separated list that specifies the allowed uses of a generated certificates. You can specify one or all of the following:

  DigitalSignature, KeyAgreement, KeyEncipherment

certificate_role_max_ttl
The maximum length of time in hours that a Vault-issued certificate lasts before expiring. Must be greater than the certificate_role_ttl.

certificate_role_ttl
The default length of time that a Vault-issued certificate lasts before expiring.

intermediate_ca
An intermediate certificate is a subordinate certificate issued by the trusted root specifically to issue end-entity server certificates.

intermediate_ca_common_name
The common name (CN) for the Vault-issued intermediate certificate authority (CA) certificate. For SAS Viya, the name is SAS Viya intermediate CA. The CN identifies the host name associated with the certificate.

intermediate_ca_desc
The name for the Vault-issued intermediate CA certificates and SAS Viya Intermediate CA.

intermediate_ca_key_bits
The key-length (in bits) of the intermediate certificate generated from Vault.

intermediate_ca_max_ttl
The maximum length of time in hours that a Vault-issued intermediate certificate lasts before expiring. Must be greater than the intermediate_ca_ttl.

intermediate_ca_ttl
The default length of time that a Vault-issued intermediate certificate lasts before expiring.

root_ca
A public key certificate that identifies a root CA. A root certificate is the top-most certificate of the tree. The private key is used to sign other certificates.

root_ca_common_name
The common name for the Vault-issued root CA certificate and SAS Viya Root CA. The CN identifies the host name associated with the certificate.

root_ca_desc
The name for the Vault-issued Root CA and SAS Viya Root CA.

root_ca_key_bits
The key-length (in bits) of the root certificate generated from Vault.

root_ca_max_ttl
The maximum length of time in hours that a Vault-issued root CA certificate lasts before expiring. Must be greater than the root_ca_ttl value.

root_ca_ttl
The default length of time that a Vault-issued root CA certificate lasts before expiring.
systems
The time in hours that secrets and tokens are managed.

system_max_lease_ttl
The maximum amount of time (in hours) that Vault-issued secrets and tokens are valid. This value must be larger than the vault_token_default_lease_ttl value for the token configuration instance.

tokens
The time in hours that secrets and tokens are valid.

vault_token_default_lease_ttl
The default length of time (in hours) that Vault-issued tokens are valid.

Note: Changes to this value take effect after running the Ansible renewal playbook.

Configuration Properties: Reference (Applications)

SAS Data Explorer

SAS Data Explorer enables you to discover data and copy it to a CAS server.

sas.dataexplorer
The set of configuration properties for SAS Data Explorer.

casSessionImportNumNodes
The number of nodes on which to start CAS sessions when running import jobs. A value of 0 means all nodes.

casSessionInteractiveNumNodes
The number of nodes on which to start CAS sessions used for browsing data sources. A value of 0 means all nodes.

filterAvailableTab
Turn the toggle switch on to automatically populate the Available and Data Sources tabs with tables only from the default caslib for your site. The default is off.

By default, the Available and Data Sources tabs display all tables that have been loaded to memory, from any CAS server to which you have access. If some nodes are slow to respond to queries from the Available and Data Sources tabs, your browser might freeze while it is waiting for a response. If slow performance persists, an administrator can specify an option so that the Available and Data Sources tabs are automatically populated with tables only from the default caslib for your site.

jobExecutionProvider
Configurable values for the SAS Data Explorer job execution provider job:

- heartbeatInterval. Default is 300. The maximum number of items that can be submitted in a single import.
- **scheduledJobExpiresAfter.** Not specified by default. The amount of time after a scheduled job completion before the job execution service deletes the job. Specify time in W3C XML duration format (for example, PT5M = 5 minutes). A null value indicates that job is not deleted.

- **maxImportQueueSize**
The maximum number of items that can be imported with the Import All option on the Import tab. The default is 100F.

- **availableTabEntryTimeoutMS**
Specifies how long (in seconds) Data Explorer waits for a given library to report back its list of available tables. The default value is 10 seconds. If the request does not come back within the allotted time, the library is not included in the available tables list. This value affects the list of available tables in the Available tab and the Data Sources tab.

- **supplementalProperties**
The set of user-added, advanced properties.

**Note:** Do not enter a property name-value pair unless you are directed to do so by SAS Technical Support.

---

**SAS Data Studio**

SAS Data Studio provides a way for you to prepare data, including data transformations.

- **sas.datastudio**
The set of configuration properties for SAS Data Studio.

- **casSessionNumNodes**
The number of nodes on which to start a SAS Data Studio CAS session (0 means all nodes).

- **casSessionTimeout**
The number of seconds to specify as the CAS session time-out for sessions that SAS Data Studio creates.

- **interactiveJobExpiresAfter**
The amount of time after an interactive data plan job completes before the job execution service deletes the job. Specify time in W3C XML duration format (for example, PT5M = 5 minutes). A null value indicates that job is not deleted.

- **maxStreamingCellCount**
The maximum number of cells returned to SAS Data Studio for the sample results table. The default value is 1,024.

- **maxStreamingCellSize**
The maximum number of characters in each cell returned to SAS Data Studio in the sample results table. A value of -1 specifies an unlimited size.

- **saveTableJobExpiresAfter**
The amount of time after a data plan job, which saves a table, completes before the job execution service deletes the job. Specify time in W3C XML duration format (for example, PT5M = 5 minutes). A null value indicates that job is not deleted.
SAS Infrastructure Data Server

SAS Infrastructure Data Server is based on PostgreSQL version 9 and is configured specifically to support SAS software. See “Overview” in SAS Viya Administration: Infrastructure Servers. Here is the list of SAS Infrastructure Data Server configuration definitions that consist of third-party PostgreSQL and pgpool-II configuration properties.

sas.dataserver.common

The set of properties that are common to a cluster (that is, both to pgpool-II and to PostgreSQL nodes).

For a list of the valid PostgreSQL property names (configuration parameters) and descriptions, see https://www.postgresql.org/docs/9.1/static/runtime-config.html.

sas.dataserver.conf

The set of properties that are used to set up the SAS Infrastructure Data Server node database configuration file, postgresql.conf.

For a list of the valid PostgreSQL property names (configuration parameters) and descriptions, see https://www.postgresql.org/docs/9.1/static/runtime-config.html.

sas.dataserver.hba

The set of properties that are used to set up the SAS Infrastructure Data Server node host-based authentication file, pg_hba.conf.

For a list of the valid PostgreSQL property names (authorization records) and descriptions, see https://www.postgresql.org/docs/9.1/static/auth-pg-hba-conf.html.

sas.dataserver.pool

The set of properties that are used to set up the pgpool-II node configuration file, pgpool.conf.

For a list of the valid pgpool-II property names (key-value pairs) and descriptions, see http://www.pgpool.net/docs/pgpool-II-3.5.4/doc/pgpool-en.html#pgpool_conf.

sas.dataserver.pool.hba

The set of properties that are used to set up the pgpool-II node host-based authentication file, pool_hba.conf.

For a list of the valid pgpool-II property names (key-value pairs) and descriptions, see http://www.pgpool.net/docs/pgpool-II-3.5.4/doc/pgpool-en.html#hba.
SAS Logon Manager

SAS Logon Manager provides OAuth2 and OpenID Connect services for authentication, and a user interface for sign-in, sign out, and other related functions. See “Authentication: Overview” in SAS Viya Administration: Authentication. Here are the configuration properties for SAS Logon Manager:

**sas.logon.callback**

The set of properties that are used to configure the whitelist of URIs for trusted applications.

`allowed.uris`

The comma-delimited list of URIs that users can be redirected to after signing in following a timeout or logoff.

**sas.logon.custom**

The set of properties that are used to provide custom content that is included on the Sign In to SAS page.

`login`

The URI of the custom content included on the Sign In to SAS page.

`logout`

The URI of the custom content included on the Sign In to SAS page when users sign out of the system.

`timedout`

The URI of the custom content included on the time-out page.

**sas.logon.groups**

The set of properties that are used to customize lookup of group authorities.

`assumable`

Specifies groups that have an elevated level of access that the user must approve at sign-in in order to assume those groups in a session.

`approvalExpirySeconds`

When approving or denying access to a third-party application, specifies the number of seconds that the approval or denial should be remembered.

`groupLookupRequired`

Requires groups to be determined for authentication to succeed.

`recursion.enabled`

Allows recursive lookups of authorities for groups assigned to users.

`requiresRecursion`

The comma-separated list of groups that require a recursive lookup to determine externally assigned authorities.
sas.logon.initial

The set of properties that are used to initially configure the system.

Note: Modifying one of these property values requires you to restart one or more SAS Viya services. For more information, see “General Servers and Services: Operate (Linux)” in SAS Viya Administration: General Servers and Services.

passwordResetLifetime
   The number of milliseconds for which that the password reset code is valid after restart.

redirectUri
   The URI to which the initial user should be redirected after resetting the password.

reset.enabled
   Displays a password reset link for the initial user account at start-up.

user
   The user name for the initial user account.

sas.logon.jasig.cas

The set of properties that are used to enable sign-ins using a Java in Administration Special Interest Group (Jasig) central authentication server (CAS) provider.

autoLink
   Automatically open the link to this provider when the login page is displayed.

casServerUrl
   The URL for the CAS server.

enabled
   Enable sign-ins using CAS.

keepalive.enabled
   Keep the CAS server session active by obtaining proxy tickets.

keepalive.proxyTicketUrl
   The URL to obtain proxy tickets for keepalive purposes.

linkText
   The hyperlink to display on the sign-in page.

sasLogonUrl
   The URL of the SAS Logon Manager (for example: https://sas.example.com/SASLogon).

service.artifactParameter
   The request parameter to look for when attempting to see whether a ticket was sent from the server.

service.authenticateAllArtifacts
   Process all tickets, including proxy tickets.

service.sendRenew
   Force the server to authenticate the user again, even if the user has previously authenticated.

service.serviceParameter
   The request parameter to send the server for this service.
showLinkText
  Show the link text on the sign-in page.

single.signOn.enabled
  Enable single sign-on.

single.signOut.enabled
  Local sign-out should sign user out of the CAS server also.

single.signOut.logoutParameterName
  The parameter name that identifies a back channel single logoff request from the CAS server.

validate.encoding
  Encoding of the ticket validation response from the server.

validate.renew
  Determine whether the ticket validation request should include a renew.

sas.logon.jwt

The set of properties that are used to configure how JSON web tokens are issued.

claims.exclude
  The comma-separated list of claims that should be excluded from the JSON web token.

issuer.uri
  The URI of the application, for the issuer claim in tokens (for example, https://example.com/SASLogon).

policy.accessTokenValiditySeconds
  The default number of seconds that access tokens are valid for after being issued in the default zone.

policy.global.accessTokenValiditySeconds
  The default number of seconds that access tokens are valid for after being issued in all zones.

policy.global.refreshTokenValiditySeconds
  The default number of seconds that refresh tokens are valid for after being issued in all zones.

policy.refreshTokenValiditySeconds
  The default number of seconds that refresh tokens are valid for after being issued in the default zone.

refresh.restrictGrant
  Grant refresh tokens only to clients with a scope of refresh_token for offline access.

signingKey
  Either a Base64-encoded RSA private key that is used to digitally sign tokens, or a simple passphrase for HMACs. Enter a value only if you want to override the system-generated RSA private key.

sas.logon.kerberos

The set of properties that are used to enable sign-ins using Integrated Windows Authentication (IWA).
Note: Modifying one of these property values requires you to restart one or more SAS Viya services. For more information, see “General Servers and Services: Operate (Linux)” in SAS Viya Administration: General Servers and Services.

debug
   Enables the debug mode of the JAAS Kerberos login module.

disableDelegationWarning
   Disables the warning message displayed to users when Kerberos credential delegation is not properly configured.

holdOnToGSSContext
   Enables Kerberos delegation to SAS Cloud Analytic Services.

impersonate
   Impersonate user credentials using Microsoft S4USELF extension to Kerberos for outgoing connections.

keyTabLocation
   The URL of the keytab file (for example, file:///opt/sas/viya/conf/etc/my_keytab).

servicePrincipal
   The name of the service principal in the keytab.

spn
   The HTTP service principal name (SPN), if different from the principal name in the keytab.

stripRealmForGss
   Removes the @... from the end of the user name.

allowCopyPasteData
   Allows users to copy and paste from the table viewer.

allowGitPassword
   Enables users to create Git profiles that require a password for HTTPS authentication.

sas.logon.oauth.providers.external_oauth

The set of OAUTH provider properties that are used to enable sign-ins using an external provider. Modifying one of these property values requires you to restart SAS Logon Manager. For more information, see SAS Viya Administration in SAS Help Center.

addShadowUserOnLogin
   Adds a local shadow user upon successful authentication.

attributeMappings.user_name
   The attribute claim to use as the user name.

authUrl
   The URL to the authorization endpoint.

clientAuthInBody
   Include the client credentials in the request body.

discoveryURL
   The URL used to discover the provider and obtain information needed to interact with it.

emailDomain
   The comma-delimited list of possible email address domains of users that can sign on with this provider.
issuer
The principal that issued the token, as a case-sensitive string or URI.

linkText
The text that should be displayed on the sign-in page for this provider.

passwordGrantEnabled
Enable use of the password grant

relyingPartyId
The client ID registered in the provider.

relyingPartySecret
The secret registered in the provider for the client ID.

responseType
The expected response type, either ‘code’ or ‘token’.

scopes
The comma-delimited list of scopes for the authorization request.

showLinkText
Shows the link text on the sign-in page.

tokenKey
The HMAC key or RSA public key used to sign tokens.

tokenKeyId
The URL to obtain the token key.

tokenUrl
The URL to the token endpoint.

type
Either ‘oidc1.0’ or ‘oauth2.0’.

userInfoURL
The OIDC 1.0 URL that returns claims about the authorized user.

sas.logon.pam
The set of properties that are used to enable sign-ins using PAM.

enabled
Enables sign-in using PAM.

serviceName
The service name in the PAM configuration.

sas.logon.provider.guest
The set of properties that are used to configure guest access to the system.

Apply configuration only to this tenant (provider)
When this property is set to off, the configuration applies to all tenants, including the provider.
Each tenant can override the configuration from within its own environment.
Note: Apply configuration only to this tenant (provider) is available only to provider tenants in a multi-tenant environment.

enabled
Enable anonymous guest access to web applications.

sas.logon.saml

The set of Security Assertion Markup Language (SAML) properties that are used to enable sign-ins using an external identity provider.

Note: Modifying one of these property values requires you to restart one or more SAS Viya services. For more information, see "General Servers and Services: Operate (Linux)" in SAS Viya Administration: General Servers and Services.

entityBaseURL
The URL of the application where SAML assertions are accepted, (for example: https://example.com/SASLogon).

entityID
The entity ID of the service provider.

maxAuthenticationAge
The maximum time (in seconds) between users’ initial authentication with the IDP and processing of an authentication statement.

serviceProviderCertificate
The PEM-encoded, X.509 certificate that is used by the service provider.

serviceProviderKey
The PEM-encoded, RSA private key that is used by the service provider.

serviceProviderKeyPassword
The password for the private key.

setProxyParams
Allows the base URL to reside behind an HTTP proxy.

CAUTION
Do not modify setProxyParams. The value should remain off (false).

signatureAlgorithm
The algorithm for SAML signatures. The accepted values are SHA1, SHA256, and SHA512.

signMetaData
Specifies that the local service provider should sign metadata.

signRequest
Specifies that the local service provider should sign SAML requests.

socket.connectionManagerTimeout
The number of milliseconds before the connection pooling times out for HTTP requests for SAML metadata.

socket.soTimeout
The number of milliseconds before the read times out for HTTP requests for SAML metadata.
wantAssertionSigned
Specifies that the assertions must be signed.

**sas.logon.saml.providers.external_saml**

The set of Security Assertion Markup Language (SAML) identity provider properties that are used to enable sign-ins using an external provider.

**addShadowUserOnLogin**
Add a local shadow user upon successful authentication. If set to false, users must be pre-created in the database to log on.

**assertionConsumerIndex**
The index of the assertion consumer service to use from identity provider metadata. The value must be a positive integer.

**authnContext**
The comma-delimited list of authorization contexts to include in SAML requests to the identity provider.

**emailDomain**
The comma-delimited list of possible email address domains of users that can log on with this provider.

**idpMetadata**
The identity provider metadata or the URL to the metadata.

**linkText**
The hyperlink to display on the sign-in page.

**metadataTrustCheck**
Specifies that the identity provider certificate must be trusted.

**nameID**
The default name ID format.

**showSamlLoginLink**
Displays a link to the identity provider on the sign-in page.

**skipSslValidation**
Skips Transport Layer Security (TLS) validation of the certificate.

**sas.logon.sas9**

The set of properties that are used to enable sign-ins using SAS 9.4 and later.

**autoLink**
Automatically open the link to SAS 9 when the login page is displayed.

**enabled**
Enable sign-ins using SAS 9 credentials.

**linkText**
The hyperlink to display on the sign-in page.

**sas9LogonUrl**

**showLinkText**
Show the link text on the sign-in page.
single.signOn.enabled
Redirect to SAS 9 for single sign-on.

single.signOut.enabled
Local sign-out should sign user out of SAS 9 also.

viyaLogonUrl
The URL of the SAS Viya Logon Manager (for example, https://viya.sas.example.com/SASLogon).

**sas.logon.sessions**

The set of properties that are used to configure how concurrent SAS Logon sessions are handled.

maxConcurrentSessions
The maximum number of allowed concurrent SAS Logon sessions. A value of -1 allows an unlimited number of sessions.

rejectNewSessionsIfMaxExceeded
Rejects new SASLogon sessions if the maximum number of sessions is exceeded. If false, when the maximum number of sessions is reached, an existing session is invalidated to allow a new one to be created.

**sas.logon.tenancy**

The set of properties that are used to configure multi-tenancy.

sas.logon.tenancy.autoUpdateLdapConfiguration
Automatically update all identity zones’ LDAP configurations when the provider LDAP configuration is changed.

sas.logon.tenancy.bootstrap.enabled
Automatically configure identity zones and LDAP when tenants are onboarded or access policy is changed.

---

**SAS Studio 5.2 (Enterprise)**

SAS Studio is a development application for SAS that you access through your web browser. SAS Studio 5.2 (Enterprise) relies on the SAS Viya service layer.

**Note:** SAS Studio 5.2 (Enterprise) is installed with a *full deployment*.

**sas.studiov**

The set of configuration properties for SAS Studio 5.2 (Enterprise).

allowCopyPasteData
Allow users to copy and paste from the table viewer.

allowDownload
Allow users to download data.

allowExport
Allow administrators to restrict users from exporting data.
allowGit
Allow users to use Git functionality.

AllowGitPassword
Enable users to create Git profiles that require a password for Git authentication.

allowPrintData
Allow users to print from the table viewer.

allowUpload
Allow users to upload data.

fileNavigationCustomRootPath
Specifies the custom path where file navigation begins.

fileNavigationRoot
Specifies where file navigation begins.

longPollingHoldTimeSeconds
The maximum number of seconds to wait for a message from the client.

longPollingQueueCapacity
The maximum number of unhandled messages can be added to the long polling queue.

maxGitFileSize
The maximum file size (in bytes) allowed for Git files.

maxUploadSize
The maximum file size (bytes) allowed for upload. The maximum allowed value for this property is 2,147,483,647.

showServerFiles
Allow administrators to show or hide the local file system.

serverDisplayName
Specifies text to display in the SAS Studio user interface in place of the server name. The default value is blank, which specifies that the server name is displayed.

SAS Studio 5.2 (Basic)

SAS Studio is a development application for SAS that you access through your web browser. SAS Studio 5.2 (Basic) relies on an embedded web application that is part of SAS Viya.

Note: SAS Studio 5.2 (Basic) is installed with a *programming-only deployment*.

For more information, see “Update SAS Studio Configuration Properties” on page 9.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default Value</th>
<th>Description</th>

<tr>
<td>sas.studio.fileNavigationCustomRootPath</td>
<td>(blank)</td>
<td>Specifies a path that determines the root node in the Folders tree.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can use <code>&lt;userid&gt;</code> substitution for a directory path (for example, <code>/home/&lt;userid&gt;</code>).</td>
</tr>
<tr>
<td>studioPreferences.general.defaultTextEncoding</td>
<td>UTF-8</td>
<td>Specifies the default SAS encoding method.</td>
</tr>
<tr>
<td>studioPreferences.SASLanguage.ValidVarName</td>
<td>ANY</td>
<td>Specifies the default value for the VALIDVARNAME option.</td>
</tr>
<tr>
<td>sas.studio.longPollingHoldTimeSeconds</td>
<td>30</td>
<td>Specifies the maximum number of seconds to wait for a message from the client.</td>
</tr>
<tr>
<td>server.servlet.session.timeout</td>
<td>1</td>
<td>Specifies the maximum number of hours a user can specify for the session time-out value in preferences.</td>
</tr>
<tr>
<td>sas.studio.maxUploadSize</td>
<td>10485760 (10MB)</td>
<td>Specifies the number of bytes allowed for file upload.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Large files can take a long time to load. If you have a large amount of content to upload, divide your content into smaller files if possible.</td>
</tr>
<tr>
<td>sas.studio.fileNavigationRoot</td>
<td>true</td>
<td>Specifies that the system root location be displayed in the Folders tree.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Set the value to false when the LOCKDOWN statement or the LOCKDOWN system option is used. For more information, see “References” in SAS Viya Administration: Programming Run-Time Servers.</td>
</tr>
<tr>
<td>Property</td>
<td>Default Value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sas.studio.studioDataParentDirectory</td>
<td>(blank)</td>
<td>Specifies the location of SAS Studio preferences, snippets, my tasks, and more. This preference is specific to the local computer. The default value is blank. An administrator must mount a shared location to access data from any workspace server session. <strong>Note:</strong> You can use <code>&lt;userid&gt;</code> substitution for a directory path (for example, <code>/home/&lt;userid&gt;</code>).</td>
</tr>
<tr>
<td>sas.studio.allowGetRecordCount</td>
<td>true</td>
<td>Specifies whether to retrieve all of the rows for database tables. If you set this property to <code>false</code>, performance improves, but you might not see all rows of the table. For example, for large tables, total rows and filtered rows appear as Unavailable in the user interface. If the table has fewer than 100 rows or you scroll to the last page of the table, the values for the total rows and filtered rows are shown.</td>
</tr>
<tr>
<td>sas.studio.basicHost</td>
<td>localhost</td>
<td>Specifies the host to use to connect to the workspace server.</td>
</tr>
</tbody>
</table>
| sas.studio.largeTableRows       | 50,000         | Specifies the maximum number of rows to display in the table viewer. If the number of rows in the table is unknown or greater than the value specified for the `sasstudio.largeTableRows` property, the following behavior occurs:  
  - SAS Studio displays a warning that sorting could take a long time.  
  - SAS Studio does not generate a list of distinct values to select from when SAS Studio filters the data. |
<p>| sas.studio.basicPort            | 8591           | Specifies the port to use to connect to the workspace server.                                          |
| sas.studio.nativeEngines        |               | Specifies the engines used to distinguish SAS data set tables from DBMS tables.                       |
| sas.studio.useSortKeyFunction   | true          | Specifies whether to generate a sortkey function when ordering in the SQL statement                   |
| sas.studio.enableAutoCompleteLibraries | true        | Specifies whether libraries are fetched when a user enters code with autocompletion enabled.          |</p>
<table>
<thead>
<tr>
<th>Property</th>

<tr>
<td>sas.studio.serverDisplayName</td>
<td>(blank)</td>
<td>Specifies text to display in the SAS Studio user interface in place of the server name.</td>
</tr>
</tbody>
</table>

**SAS Visual Analytics**

**sas.visualanalytics**

- **Background Queries**
  Specifies the relative amount of background queries to use when loading reports. Background queries are requests for objects that are used in a report but are not currently visible to the user. Values range from 0 (no background queries) to 5 (maximum number of background queries). The default value is 0.

- **Related Measures Limit**
  The related measures query will not run for data sources that have a measure count that exceeds this limit.

- **backgroundPageRendering**
  Specifies the number of pages the SAS Visual Analytics loads in the background.

- **IFrame Sandbox Attribute Value**
  Specifies the value of the sandbox attribute for inline frames (iframes) in SAS Visual Analytics reports. Web content objects and data-driven content objects use inline frames. The default value is `allow-forms allow-presentation allow-same-origin allow-scripts`.

  **Note:** To enable links in inline frames to open a new window or tab, add `allow-popups` to the value.

  **Note:** To enable downloads in inline frame content in Google Chrome, add `allow-downloads` to the value.
Configuration Properties: Reference (System)

Commons REST Client

The following are properties to configure the commons REST client library, a library that all SAS Viya microservices incorporate.

sas.commons.rest.client

The set of configuration properties for the commons REST client library.

Bypass HTTP proxy

- Enables requests to be routed directly to the service rather than through the HTTP proxy.
- Changing Bypass HTTP proxy requires you to restart all SAS Viya services.

HTML Clients

The following are properties to configure HTML clients.

sas.htmlcommons

The set of properties for HTML clients.

blockedFileExtensions

- A regular expression containing a list of file extensions that the HTML applications are allowed to block. Separate values with a vertical bar (|)

blockCommentAttachments

- Blocks users from viewing or adding attachments to comments. If set to true, the button for adding attachments to comments is hidden in the user interface. Any attachments that were previously added are also hidden.

disableWelcomeScreens

- If set to true, disables the welcome screen in HTML applications. Click Add property to specify this configuration property.
Java Virtual Machine (JVM)

The set of properties (Java options) that are used to configure the Java Virtual Machine when it is launched. Each JVM property specified in SAS Environment Manager corresponds to a single Java option.

To specify service or global options for the JVM, follow the steps listed in “Create Configuration Instances” on page 4.

**Note:** Creating or modifying one of these property values requires you to restart one or more SAS Viya services. For more information, see “General Servers and Services: Operate (Linux)” in SAS Viya Administration: General Servers and Services.

When adding each JVM property, remember these guidelines:

- For the list of the valid Java options and descriptions, see [http://docs.oracle.com/javase/6/docs/technotes/tools/windows/java.html](http://docs.oracle.com/javase/6/docs/technotes/tools/windows/java.html).
- The property name for each Java option that you add must start with the string, java_option_ (for example, java_option_xmx).
- The property value is a single Java command-line option (for example, -Xmx512m).
- When the property names match, Java options specified at the service level override global Java options.
- Matching a Java option’s property name (with a value consisting of a zero-length string) is the only way to disable Java option values.
- There is no control over the order that the JVM processes Java options.

Security

The following are properties to configure web security.

**sas.commons.web.security**

The set of properties that are used to configure web security.

- content-security-policy
  - The string used for the Content-Security-Policy HTTP header.
- content-security-policy-enabled
  - Sends the Content-Security-Policy header in HTTP responses to prevent injection attacks.
- x-content-type-options
  - The string used for the X-Content-Type-Options header for unsecured endpoints.
- x-content-type-options-enabled
  - Sends the X-Content-Type-Options header in HTTP responses for unsecured endpoints.
x-frame-options
The string used for the X-Frame-Options HTTP header. A restart is required to pick up changes to this property.

x-frame-options-enabled
Sends the X-Frame-Options header in HTTP responses. A restart is required to pick up changes to this property.

x-xss-protection
The string used for the X-XSS-Protection header for unsecured endpoints.

x-xss-protection-enabled
Sends the X-XSS-Protection header in HTTP responses for unsecured endpoints.

sas.commons.web.security.cookies
The set of properties that are used to configure security related to cookies.

sameSite
Specifies whether cookies should be sent only with same-site requests. These are the valid values:
- Unset (default)
- None

sas.commons.web.security.cors
The set of properties that are used to configure Cross-Origin Resource Sharing (CORS) security. By default, CORS is enabled. For more information about CORS, see CORS support in Spring Framework.

Modifying one of these property values requires you to restart the service.

allowCredentials
Allows credentials to be used in cross-origin requests. By default, this property is set to On.

allowedHeaders
The comma-separated list of HTTP headers that are allowed, by default, in cross-origin requests. Specify an asterisk ("*"") to match any header.

allowedOrigins
The comma-separated list of origins that are allowed by default. Specify an asterisk ("*"") to match any origin.

allowedMethods
The comma-separated list of HTTP methods that are allowed, by default, in cross-origin requests. Specify an asterisk ("*"") to match any method.
sas.commons.web.security.csrf

The set of properties that are used to configure Cross-Site Request Forgery (CSRF) security. By default, CSRF is enabled. To disable it, create a new configuration for the security definition. Specify the property name as `enable-csrf` and the value as `false`. For more information, see “Create Configuration Instances” on page 4.

SAS Viya protects against CSRF using the following:

- **Synchronizer Tokens**: Randomly generated tokens that are associated with the user’s current session. CSRF is checked only on requests with authenticated sessions and is always skipped on GET, HEAD, TRACE, and OPTIONS requests.

- **Header Checking**: A filter that checks that the HTTP Referer header has the host and port of the requested URI or matches an optional whitelist of URIs that is configured as a comma-separated list in the `sas.commons.web.security.csrf.allowedUris` property.

For more information about CSRF, see Common application properties.

allowedReferers
This property is currently not supported and should be left blank.

allowedUris
The comma-separated list of referer URIs that are allowed by default. The list must contain regular expressions.

failIfNoHeaders
Blocks requests if both the Origin and Referer headers are absent.

sas.security

The set of configuration properties that are used to configure security for SAS Viya servers and services. The sas.security configuration instance applies to all SAS Viya servers and services (global).

network.databaseTraffic.enabled
Toggle security for database traffic.

network.sasData.enabled
Toggle security for other SAS information.

network.serverControl.enabled
Toggle security for serverControl.

network.web.enabled
Toggle security for web-based traffic.

Spring Boot Services

Here is the list of third-party, Spring Boot services that you can configure. For a list of the valid property names and descriptions, see Common application properties.

CAUTION
When adding a property, be extremely careful. Entering the wrong property name or an invalid data type can cause SAS Viya to become inoperable.

Endpoints
   The set of properties that are used to configure Spring Actuator endpoints.

Flyway
   The set of properties that are used to configure Spring Flyway integration.

Liquibase
   The set of properties that are used to configure Spring Liquibase integration.

Logging
   The set of properties that are used to configure logging.

Logging.Level
   The set of properties that are used to configure logging levels.

Management
   The set of properties that are used to configure Spring application management.

Multipart
   The set of properties that are used to configure Spring multipart handling.

Security
   The set of properties that are used to configure Spring security.

Server
   The set of properties that are used to configure the embedded Spring server.

Shell
   The set of properties that are used to configure the Spring remote shell.

Spring
   The set of properties that are used to configure other Spring features.

zones

The set of properties that are used to configure zone information for multi-tenancy. Modifying one of these property values requires you to restart the service.

internal.hostnames
   The comma-separated list of internal host names that are used to access the provider zone, or that are used in a subdomain to access other zones.

**TIP** Be sure to specify the base host name without any tenant prefixes.

**TIP** If you use a load balancer as a front end to the Apache HTTP Server and microservices, you must include the full qualified domain name of the load balancer in the list of host names.
Configuration Properties: Troubleshooting

Service fails to start

Explanation:
A service might fail to start for many reasons. One error that can cause start failure is if you recently modified a configuration instance on which the service depends, and either the property name is misspelled or its value is incorrect.

Resolution:
Check any recently modified configuration instances, looking for a property misspelling or incorrect value. To do this, from the Configuration window in SAS Environment Manager, choose Definitions. Select the name of the configuration definition that you modified and look for any problems.

Configuration Properties: Interfaces

There are several interfaces that you can use to manage configuration properties for SAS Viya servers, services, and applications. The following table lists these interfaces and the shading indicates the relative amount of SAS Viya configuration that each covers:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>A software orchestration tool that provides a straightforward approach to deploying and provisioning SAS Viya. You can specify configuration property defaults at installation.</td>
</tr>
<tr>
<td>SAS Environment Manager</td>
<td>A graphical enterprise web application that enables you to modify and view SAS Viya configuration properties.</td>
</tr>
<tr>
<td>Command-line interface</td>
<td>A command-line interface that enables you to manage SAS Viya configuration properties.</td>
</tr>
</tbody>
</table>
