SAS® Event Stream Manager 6.2: What’s New

Cloud-Native Capabilities
SAS Event Stream Processing 6.2 provides a pre-built Docker image of the SAS Event Stream Manager application, which you can deploy to a Kubernetes cluster. For more information, see “Cloud-Native Capabilities” in SAS Event Stream Processing: What’s New.

Deploying Projects to a Kubernetes Cluster
SAS Event Stream Manager enables you to deploy projects to a Kubernetes cluster. When a project is deployed to a cluster, an ESP server is created on demand in the cluster. When the project is stopped, the ESP server is deleted from the cluster. For more information, see “ESP Server in a Cluster” in SAS Event Stream Manager: Using SAS Event Stream Manager.

ESP Server Log Visible in SAS Event Stream Manager
If an ESP server is assigned to a deployment, SAS Event Stream Manager can display a real-time view of the ESP server log. For more information, see “View the ESP Server Log” in SAS Event Stream Manager: Using SAS Event Stream Manager.
Enhancements to the User Interface

The user interface has been enhanced. For example, the color scheme has been updated and windows have a new style. For an overview of the current user interface, see “Understanding the User Interface” in SAS Event Stream Manager: Using SAS Event Stream Manager.

SAS Event Stream Manager Documentation in the SAS Event Stream Processing Help Center

SAS Event Stream Manager documentation has been merged with the SAS Event Stream Processing documentation in the SAS Event Stream Processing Help Center.
