Overview of Syntax Conventions for the SAS Language

SAS uses standard conventions in the documentation of syntax for SAS language elements. These conventions enable you to easily identify the components of SAS syntax. The conventions can be divided into these parts:

- syntax components
- style conventions
- special characters
- references to SAS libraries and external files

Syntax Components

The components of the syntax for most language elements include a keyword and arguments. For some language elements, only a keyword is necessary. For other language elements, the keyword is followed by an equal sign (=). The syntax for arguments has multiple forms in order to demonstrate the syntax of multiple arguments, with and without punctuation.

Keyword

specifies the name of the SAS language element that you use when you write your program. Keyword is a literal that is usually the first word in the syntax. In a CALL routine, the first two words are keywords.

In these examples of SAS syntax, the keywords are bold:

- **CHAR** *(string, position)*
- **CALL RANBIN** *(seed, n, p, x)*;
- **ALTER** *(alter-password)*
- **BEST** *w.*
- **REMOVE** *<data-set-name>*

In this example, the first two words of the CALL routine are the keywords:
CALL RANBIN(seed, n, p, x)

The syntax of some SAS statements consists of a single keyword without arguments:

DO;
... SAS code ...
END;

Some system options require that one of two keyword values be specified:

DUPLEX | NODUPLEX

Some procedure statements have multiple keywords throughout the statement syntax:

CREATE <UNIQUE> INDEX index-name ON table-name (column-1 <, column-2, …>)

argument
specifies a numeric or character constant, variable, or expression. Arguments follow the keyword or an equal sign after the keyword. The arguments are used by SAS to process the language element. Arguments can be required or optional. In the syntax, optional arguments are enclosed in angle brackets (< >).

In this example, string and position follow the keyword CHAR. These arguments are required arguments for the CHAR function:

CHAR (string, position)

Each argument has a value. In this example of SAS code, the argument string has a value of 'summer', and the argument position has a value of 4:

x=char('summer', 4);

In this example, string and substring are required arguments, whereas modifiers and startpos are optional.

FIND(string, substring <, modifiers> <, startpos>

argument(s)
specifies that one argument is required and that multiple arguments are allowed. Separate arguments with a space. Punctuation, such as a comma (,) is not required between arguments.

The MISSING statement is an example of this form of multiple arguments:

MISSING character(s);

<LITERAL_ARGUMENT> argument-1 <<LITERAL_ARGUMENT> argument-2 ... >
specifies that one argument is required and that a literal argument can be associated with the argument. You can specify multiple literals and argument pairs. No punctuation is required between the literal and argument pairs. The ellipsis (...) indicates that additional literals and arguments are allowed.

The BY statement is an example of this argument:

BY <DESCENDING> variable-1 <<DESCENDING> variable-2 ...>;

argument-1 <options> <argument-2 <options> ...>
specifies that one argument is required and that one or more options can be associated with the argument. You can specify multiple arguments and associated options. No punctuation is required between the argument and the
option. The ellipsis (...) indicates that additional arguments with an associated option are allowed.

The FORMAT procedure PICTURE statement is an example of this form of multiple arguments:

```
PICTURE name <(format-options)>
<value-range-set-1 <(picture-1-options)> 
<value-range-set-2 <(picture-2-options)> ...>;
```

`argument-1=value-1 <argument-2=value-2 ...>`

specifies that the argument must be assigned a value and that you can specify multiple arguments. The ellipsis (...) indicates that additional arguments are allowed. No punctuation is required between arguments.

The LABEL statement is an example of this form of multiple arguments:

```
LABEL variable-1=label-1 <variable-2=label-2 ...>;
```

`argument-1, argument-2, ...`

specifies that one argument is required and that you can specify multiple arguments that are separated by a comma or other punctuation. The ellipsis (...) indicates a continuation of the arguments, separated by a comma. Both forms are used in the SAS documentation.

Here are examples of this form of multiple arguments:

```
AUTHPROVIDERDOMAIN (provider-1:domain-1 <, provider-2:domain-2, ...>
INTO :macro-variable-specification-1 < :macro-variable-specification-2, ...>
```

Note: In most cases, example code in SAS documentation is written in lowercase with a monospace font. You can use uppercase, lowercase, or mixed case in the code that you write.
nonliteral arguments. In this example of the LINK statement, the argument
label is a user-supplied value and therefore appears in italic:

```
LINK label;
```

nonliteral values that are assigned to an argument.

In this example of the FORMAT statement, the argument DEFAULT is
assigned the variable default-format:

```
FORMAT variable(s) <format> <DEFAULT = default-format>;
```

Special Characters

The syntax of SAS language elements can contain the following special characters:

- `=` an equal sign identifies a value for a literal in some language elements such as
  system options.

  In this example of the MAPS system option, the equal sign sets the value of
  MAPS:

  ```
  MAPS=location-of-maps
  ```

- `< >` angle brackets identify optional arguments. A required argument is not enclosed
  in angle brackets.

  In this example of the CAT function, at least one item is required:

  ```
  CAT (item-1 <, item-2, …>)
  ```

- `|` a vertical bar indicates that you can choose one value from a group of values.
  Values that are separated by the vertical bar are mutually exclusive.

  In this example of the CMPMODEL= system option, you can choose only one of
  the arguments:

  ```
  CMPMODEL=BOTH | CATALOG | XML
  ```

- `...` an ellipsis indicates that the argument can be repeated. If an argument and the
  ellipsis are enclosed in angle brackets, then the argument is optional. The
  repeated argument must contain punctuation if it appears before or after the
  argument.

  In this example of the CAT function, multiple item arguments are allowed, and
  they must be separated by a comma:

  ```
  CAT (item-1 <, item-2, …>)
  ```

- `'value' or "value" indicates that an argument that is enclosed in single or double quotation marks
  must have a value that is also enclosed in single or double quotation marks.

  In this example of the FOOTNOTE statement, the argument text is enclosed in
  quotation marks:

  ```
  FOOTNOTE <n> <ods-format-options 'text' | "text">;
  ```
a semicolon indicates the end of a statement or CALL routine.

In this example, each statement ends with a semicolon:

data namegame;
    length color name $8;
    color = 'black';
    name = 'jack';
    game = trim(color) || name;
run;

References to SAS Libraries and External Files

Many SAS statements and other language elements refer to SAS libraries and external files. You can choose whether to make the reference through a logical name (a libref or fileref) or use the physical filename enclosed in quotation marks.

If you use a logical name, you typically have a choice of using a SAS statement (LIBNAME or FILENAME) or the operating environment's control language to make the reference. Several methods of referring to SAS libraries and external files are available, and some of these methods depend on your operating environment.

In the examples that use external files, SAS documentation uses the italicized phrase file-specification. In the examples that use SAS libraries, SAS documentation uses the italicized phrase SAS-library enclosed in quotation marks:

infile file-specification obs = 100;
libname libref 'SAS-library';
Syntax Conventions for the SAS Language
What's New in SAS 9.4 Formats and Informats

Overview

SAS Viya 3.4 adds the $UUID format and informat.

New formats write date, time, and datetime values based on user local time.

Some format values might differ slightly when the DECIMALCONV= system option is set to STDIEEE.

New SAS Formats

The following formats are new:

$UUID
converts character data to Universally Unique Identifier (UUID) format.

B8601DXw.
adjusts a Coordinated Universal Time (UTC) datetime value to the user local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone basic notation `yyyyymmddThhmmss+hhmm`.

B8601LXw.
writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 basic notation `yyyyymmddThhmmss—hhmm`.

B8601TXw.
adjusts a Coordinated Universal Time (UTC) value to the user local time. Then, writes the local time by using the ISO 8601 basic time notation `hhmmss+-hhmm`.

E8601DXw.
adjusts a Coordinated Universal Time (UTC) datetime value to the user local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone extended notation `yyyy-mm-ddThh:mm:ss+hh:mm`. 
E8601LXw.
  Writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 extended notation yyyy-mm-ddThh:mm:ss+|–hh:mm.

E8601TXw.
  Adjusts a Coordinated Universal Time (UTC) value to the user local time. Then, writes the local time by using the ISO 8601 extended time notation hh:mm:ss+|–hh:mm.

ODDSRw.
  Writes odds ratios.

Format Output Differences Due to the DECIMALCONV= System Option

When the DECIMALCONV= system option is set to STDIEEE, SAS converts and formats decimal values using the IEEE Standard for Floating-Point Arithmetic 754–2008. This standard improves the accuracy of floating-point numbers. The output written for the following formats might differ slightly from previous releases:

<table>
<thead>
<tr>
<th>Format</th>
<th>Previous Release</th>
<th>New Release</th>

For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

New Informsats

SAS Viya 3.4 has added the $UUIDw. informat.

$UUIDw.
  Converts hexadecimal data to a 16-byte binary variable Universally Unique Identifier (UUID).
Enhancements to Existing Informats

SAS 9.4M2 has added new aliases for some time-zone informats:

Definition of Formats

A format is a type of SAS language element that applies a pattern to or executes instructions for a data value to be displayed or written as output. Types of formats correspond to the type of data: numeric, character, date, time, or timestamp. The ability to create user-defined formats is also supported. Examples of SAS formats are BINARY, DATE, and WORDS. For example, the WORDS22. format, which converts numeric values to their equivalent in words, writes the numeric value 692 as six hundred ninety-two.

Syntax

SAS formats have the following form:

\(<\$>format<w>.<d>\)

- \$ indicates a character format. Its absence indicates a numeric format.

- format names the format. The format is a SAS format or a user-defined format that was previously defined with the VALUE statement in PROC FORMAT.

- See For information about user-defined formats, see “FORMAT Procedure” in Base SAS Procedures Guide.

- \(w\) specifies the format width, which for most formats is the number of columns in the output data.

- \(d\) specifies an optional decimal scaling factor in the numeric formats.

Formats contain a period (.) as a part of the name. If you omit the \(w\) and \(d\) values from the format, SAS uses default values. The \(d\) value that you specify with a format
tells SAS to display that many decimal places. Formats never change or truncate the internally stored data values.

For example, in DOLLAR10.2, the w value of 10 specifies a maximum of 10 columns for the value. The d value of 2 specifies that two of these columns are for the decimal part of the value, which leaves eight columns for the remaining characters in the value. The remaining columns include the decimal point, the remaining numeric value, a minus sign if the value is negative, the dollar sign, and any commas.

If the format width is too narrow to represent a value, SAS tries to squeeze the value into the space available. Character formats truncate values on the right. Numeric formats sometimes revert to the BESTw.d format. SAS prints asterisks if you do not specify an adequate width. In this example, the result is x=**: 

x=123;
put x= 2.;

If you use an incompatible format, such as a numeric format to write character values, SAS first attempts to use an analogous format of the other type. If this attempt fails, an error message that describes the problem is displayed in the SAS log.

When the value of d is greater than 15, the precision of the decimal value after the 15th significant digit might not be accurate.

---

Using Formats

Ways to Specify Formats

About Specifying Formats

You can specify formats in these ways:
- in a PUT statement
- with the PUT, PUTC, or PUTN functions
- with the %SYSFUNC or %QSYSFUNC macro functions
- in a FORMAT statement in a DATA step or a PROC step
- in an ATTRIB statement in a DATA step or a PROC step

PUT Statement

The PUT statement with a format after the variable name uses a format to write data values in a DATA step. For example, this PUT statement uses the DOLLARw.d format to write the numeric value for AMOUNT as a dollar amount:

amount=1145.32;
put amount dollar10.2;

The DOLLARw.d format in the PUT statement produces this result:
$1,145.32
For more information, see “PUT Statement” in SAS DATA Step Statements: Reference.

PUT Function
The PUT function converts a numeric variable, a character variable, or a constant by using any valid format, and then returns the resulting character value. For example, this statement converts the value of a numeric variable to a two-character hexadecimal representation:

```sas
num=15;
char=put(num,hex2.);
```

The PUT function returns a value of 0F, which is assigned to the variable CHAR.

The PUT function is useful for converting a numeric value to a character value.
For more information, see “PUT Function” in SAS Functions and CALL Routines: Reference.

%SYSFUNC Macro Function
The %SYSFUNC (or %QSYSFUNC) macro function executes SAS functions or user-defined functions and applies an optional format to the function outside a DATA step. For example, this program writes a numeric value in a macro variable as a dollar amount:

```sas
%macro tst(amount);
   %put %sysfunc(putn(&amount,dollar10.2));
%mend tst;

%tst (1154.23);
```

For more information, see “%SYSFUNC, %QSYSFUNC Macro Functions” in SAS Macro Language: Reference.

FORMAT Statement
The FORMAT statement permanently associates character variables with character formats and numeric variables with numeric formats.

SAS uses the format to write the values of the variable that you specify. For example, the following statement in a DATA step associates the COMMAw.d numeric format with the variables SALES1 through SALES3:

```sas
format sales1-sales3 comma10.2;
```

Because the FORMAT statement permanently associates a format with a variable, any subsequent DATA step or PROC step uses COMMA10.2 to write the values of SALES1, SALES2, and SALES3.

For more information, see “FORMAT Statement” in SAS DATA Step Statements: Reference.

Note: If you assign formats with a FORMAT statement before a PUT statement, all leading blanks are trimmed. Formats that are associated with variables that use a FORMAT statement behave like formats that are used with a colon (:) modifier in a
ATTRIB Statement

The ATTRIB statement can also associate a format, as well as other attributes, with one or more variables. In this statement, the ATTRIB statement permanently associates the COMMAw.d format with the variables SALES1 through SALES3:

```
attrib sales1-sales3 format=comma10.2;
```

Because the ATTRIB statement permanently associates a format with a variable, any subsequent DATA step or PROC step uses COMMA10.2 to write the values of SALES1, SALES2, and SALES3.

For more information, see “ATTRIB Statement” in SAS DATA Step Statements: Reference.

Permanent versus Temporary Association

When you specify a format in a PUT statement, SAS uses the format to write data values during the DATA step but does not permanently associate the format with a variable. To permanently associate a format with a variable, use a FORMAT statement or an ATTRIB statement in a DATA step. SAS permanently associates a format with the variable by modifying the descriptor information in the SAS data set.

Using a FORMAT statement or an ATTRIB statement in a PROC step associates a format with a variable for that PROC step, as well as for any output data sets that the procedure creates that contain formatted variables.

For more information about using formats in SAS procedures, see “Formatted Values” in Base SAS Procedures Guide.

User-Defined Formats

In addition to the formats that are supplied with Base SAS software, you can use PROC FORMAT to create your own formats. PROC FORMAT enables you to create your own formats for both character and numeric variables.

**Note:** PROC FORMAT is valid on the SAS client and the CAS server.

For more information, see “FORMAT Procedure” in Base SAS Procedures Guide and SAS Cloud Analytic Services: User-Defined Formats.

User-defined format names cannot end in a number. If you specify a user-defined format whose name ends in a number, SAS returns an error. You can re-create the format with a valid name that does not end in a number, or you can use PROC CATALOG to rename the format. Here is an example that uses PROC CATALOG to change the name of a user-defined format from MYFMT22 to MYFMT.

```
proc catalog cat=workformats;
change myfmt22=myfmt / entrytype=format;
```
quit;

Note: A SAS user or a third party's software might create a format with a name that ends in a number. Follow the guidelines for naming SAS elements at “Names in the SAS Language” in SAS Language Reference: Concepts when you create user-defined formats.

When you execute a SAS program on the SAS client that uses user-defined formats, you can make these formats available in two ways:

- Create permanent, not temporary, formats with PROC FORMAT.
- Store the source code that creates the formats (the PROC FORMAT step) with the SAS program that uses them.

To create permanent SAS formats, see “FORMAT Procedure” in Base SAS Procedures Guide.

Your CAS administrator can configure the server so that format libraries are added and promoted from libraries that are persisted as SASHDAT files in a caslib's data source. The format libraries that you have created are not automatically loaded when you start a CAS session, even if you have persisted them.

When you execute a SAS program in a CAS session that uses user-defined formats, you can make these formats available in three ways:

- Use the addFmtLib action to add a format library that has been created with PROC FORMAT.
- Use the SAVEFMTLIB option of the CAS statement to save a format library to a CAS table or a SASHDAT. The table and the file include the formats in a format library.
- Use the LOADFORMATS option of the CAS statement to load user-defined formats from a format item-store file that was created with PROC FMTC2ITM.

For more information, see addFmtLib Action and CAS Statement.

If you execute a program that cannot locate a user-defined format, the result depends on the setting of the FMTERR system option. If the user-defined format is not found, these system options produce these results:

<table>
<thead>
<tr>
<th>System Option</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>FMTERR</td>
<td>SAS produces an error that causes the current DATA or PROC step to stop processing.</td>
</tr>
<tr>
<td>NOFMTERR</td>
<td>SAS continues processing and substitutes a default format, usually the BESTw. or $w. format. SAS also writes a note to the log indicating that the specified format was not found or could not be loaded.</td>
</tr>
</tbody>
</table>

Although using NOFMTERR enables SAS to process a variable, you lose the information that the user-defined format supplies.

To avoid problems, ensure that your program has access to all user-defined formats that are used.
Restrictions on Formatting Dates

**CAUTION**

**Using century dates greater than 4000 might result in incorrect dates.** SAS does not consider century years that are divisible by 4000 to be leap years. In SAS, the years 4000 and 8000 are not leap years. Computations on dates that use a century date greater than or equal to 4000 might be off by days, depending on the computation.

About SAS Date, Time, and Datetime Values

Creating a SAS Date

You can use these methods to create a SAS date:

- Read a value into SAS with an informat.
- Apply a format to an existing value.
- Use a date function.

Definitions

SAS date value

is a value that represents the number of days between January 1, 1960, and a specified date. SAS can perform calculations on dates ranging from A.D. November 1582 to A.D. 19,900. Dates before January 1, 1960, are negative numbers; dates after January 1, 1960, are positive numbers.

- SAS date values account for all leap year days, including the leap year day in the year 2000.
- SAS date values can reliably tell you what day of the week a particular day fell on as far back as September 1752. That was when the calendar was adjusted by dropping several days. SAS day-of-the-week and length-of-time calculations are accurate in the future to A.D. 19,900.
- Various SAS language elements handle SAS date values: functions, formats, and informats.

SAS time value

is a value representing the number of seconds since midnight of the current day. SAS time values are between 0 and 86400.
SAS datetime value
is a value representing the number of seconds between January 1, 1960, and an hour/minute/second within a specified date.

The following figure shows some dates written in calendar form and as SAS date values.

Figure 1.1  How SAS Converts Calendar Dates to SAS Date Values

Julian Date Formats and Astronomical Dates

SAS Date Values
SAS uses SAS date values, which are ordinal numbers, to calculate dates. SAS date values represent the number of days between January 1, 1960, and a specified date. All SAS formats, informats, and functions use SAS dates. You have to use an informat to convert a Julian date to a SAS date before SAS can use it to perform calculations.

The following SAS language elements do not convert SAS dates to Julian dates. They apply a Julian date format to a SAS date.

<table>
<thead>
<tr>
<th>Formats</th>
<th>Informats</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>JULDAY</td>
<td>JULIAN</td>
<td>DATEJUL</td>
</tr>
<tr>
<td>JULIAN</td>
<td>PDJULG</td>
<td>JULDATE</td>
</tr>
<tr>
<td>PDJULG</td>
<td>PDJULI</td>
<td>JULDATE7</td>
</tr>
<tr>
<td>PDJULI</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SAS can perform calculations on raw SAS date values and on formatted SAS date values. This includes performing calculations on Julian formatted date values.

SAS uses these definitions of Julian dates and Julian formats:

Julian date
is the number of continuous days since January 1, 4713 BC, which is also known as an astronomical date.
Julian format

is the representation of an ordinal SAS date in the form of a calendar day, YYDDD or YYDD.

SAS uses the Julian format (ordinal date) definition of dates. Julian-related language elements in SAS do not convert SAS dates internally to Julian astronomical dates. These Julian-related language elements make a SAS date look like an ordinal date with the form YYDDD or YYYYDDD. For example, January, 23, 2018 is 18023 when you apply a Julian format in SAS.

You must define the values as SAS dates before using them in calculations. The only way you can convert a SAS date to an astronomical date is to add 2,436,934.5 to the SAS date value. This conversion enables SAS to use the values to perform calculations. Otherwise, SAS treats the values as regular integer numeric values, and you might get unexpected results.

Example: Performing Calculations on Dates That Have Different Formats

The following example performs these tasks:

- Creates a data set that contains SAS dates.
- Converts the dates into the MMDDYY10 format and the Julian format.
- Performs calculations on the two sets of dates, even though they have different formats.

```sas
data dates; /* 1 */
  input sas_date;
datalines;
21519
21522
21528
21535
21545
21555
21565
;  
proc print data = dates;
run;

data dates2; /* 2 */
  set dates;
  formatted_sas_date = sas_date;
  julian_formatted_SAS_date = sas_date;
  format formatted_sas_date mmddyy10. julian_formatted_SAS_date julian.; /* 3 */
run;
proc print data=dates2;
run;

data dates3; /* 4 */
  set dates2;
  datediff=sas_date - lag(julian_formatted_SAS_date); /* 5 */
run;
proc print data =dates3;
run;
```

1 Create the data set of SAS dates.
Convert the dates into the MMDDYY10 format and the Julian format.

The FORMAT statement creates the two formats for the dates.

Perform calculations on the formatted dates.

The LAG function compares the SAS date values in the previous row with the value in the current row and returns the difference.

Output 1.1 Converting SAS Dates and Using the Results in Calculations

Two-Digit and Four-Digit Years

SAS software can read two-digit or four-digit year values. If SAS encounters a two-digit year, the YEARCUTOFF= option can be used to specify which century within a 100-year span the two-digit year should be attributed to. For example, YEARCUTOFF=1950 means that two-digit years 50 through 99 correspond to 1950 through 1999. Two-digit years 00 through 49 correspond to 2000 through 2049. Note that while the default value of the YEARCUTOFF= option in SAS is 1926, you can adjust the YEARCUTOFF= value in a DATA step to accommodate the range of date values that you are working with at the moment. To correctly handle two-digit years representing dates between 2000 and 2099, you should specify an appropriate YEARCUTOFF= value between 1901 and 2000. For more information, see the “YEARCUTOFF= System Option” in SAS System Options: Reference.

Five-Digit Years

Although some formats that specify a width large enough to accommodate formatting a five-digit year, such as DATETIME20., the SAS documentation does not display five-digit years.

The Year 2000

Using the YEARCUTOFF= System Option

SAS software treats the year 2000 like any other leap year. If you use two-digit year numbers for dates, you probably need to adjust the default setting for the YEARCUTOFF= option to work with date ranges for your data or switch to four-digit years. The following program changes the YEARCUTOFF= value to 1950. This change means that all two-digit dates are now assumed to fall in the 100-year span from 1950 to 2049.

```sas
options yearcutoff=1950;
data _null_;  
a='26oct02'd;  
put 'SAS date='a;  
put 'formatted date='a date9.;  
run;
```

The PUT statement writes the following lines to the SAS log:

SAS date=15639
formatted date=26OCT2002

Note: Whenever possible, specify a year using all four digits. Most SAS date and time language elements support four-digit year values.
Example: How YEARCUTOFF= Affects Two- and Four-Digit Years

The following example shows what happens with data that contains both two and four-digit years. By default, the YEARCUTOFF= option is set to 1926.

```sas
options nodate;

data schedule;
  input @1 jobid $ @6 projdate mmddyy10.;
  datalines;
A100  01/15/25
A110  03/15/2025
A200  01/30/96
B100  02/05/12
B200  06/15/2012
;

proc print data=schedule;
  format projdate mmddyy10.;
run;
```

The resulting output from the PROC PRINT statement looks like this:

_Output 1.2  Output Showing Four-Digit Years That Result from Setting YEARCUTOFF= to 1926_

<table>
<thead>
<tr>
<th>Obs</th>
<th>jobid</th>
<th>projdate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A100</td>
<td>01/15/2025</td>
</tr>
<tr>
<td>2</td>
<td>A110</td>
<td>03/15/2025</td>
</tr>
<tr>
<td>3</td>
<td>A200</td>
<td>01/30/1996</td>
</tr>
<tr>
<td>4</td>

<td>02/05/2012</td>
</tr>
<tr>
<td>5</td>
<td>B200</td>
<td>06/15/2012</td>
</tr>
</tbody>
</table>

Here are some facts to note in this example:

- In the data lines in the DATA step, the first record contains a two-digit year of 25, and the second record contains a four-digit year of 2025. The century for the first record defaults to the 2000s because 2025 is in the range of 1926–2025. The four-digit year in the second record is unaffected by the YEARCUTOFF= option.

- In the third record, the century defaults to the 1900s because the year 1996 is in the range of 1926–2025.

- The output from the fourth and fifth records show results that are similar to the first and second records. The fourth record specifies a two-digit year of 12, and the fifth one specifies a four-digit year of 2012. The century in the fourth record defaults to the 2000s because 2012 is in the range of 1926–2025. The four-digit year in the fifth record is unaffected by the YEARCUTOFF= option.
As you can see, specifying a two-digit year might or might not result in the intended century prefix. The optimal value of the YEARCUTOFF= option depends on the range of the dates that you are processing.

In releases SAS 6.06 through SAS 6.12, the default value for the YEARCUTOFF= system option is 1900. Starting with SAS 7, the default value is 1920; starting with SAS 9.4, the default value is 1926.

For more information about how SAS handles dates, see the section on dates, times, and datetime values.

Practices That Help Ensure Date Integrity

The following practices help ensure that your date values are correct during all the conversions that occur during processing:

- Store dates as SAS date values, not as simple numeric or character values.
- Use the YEARCUTOFF= system option when converting two-digit dates to SAS date values.
- Examine sets of raw data coming into your SAS process to make sure that any dates containing two-digit years are correctly interpreted by the YEARCUTOFF= system option. Look out for the following situations:
  - two-digit years that are distributed over more than a 100-year period. For dates covering more than a 100-year span, you must either use four-digit years in the data, or use conditional logic in a DATA step to interpret them correctly.
  - two-digit years that need an adjustment to the default YEARCUTOFF= range. For example, if the default value for YEARCUTOFF= in your operating environment is 1926 and you have a two-digit date in your data that represents 1925, you have to adjust your YEARCUTOFF= value downward by a year in the SAS program that processes this value.
- Make sure that output SAS data sets represent dates as SAS date values.
- Check your SAS programs to make sure that formats and informats that use two-digit years, such as DATE7., MMDDYY6., or MMDDYY8., are reading and writing data correctly.

Note: The YEARCUTOFF= option has no effect on dates that are already stored as SAS date values.

Working with SAS Dates and Times

Informats and Formats

SAS converts date, time, and datetime values back and forth between calendar dates and clock times with SAS language elements called formats and informats.

- Formats present a value, recognized by SAS, such as a time or date value, as a calendar date or clock time in a variety of lengths and notations.
Informs read notations or a value, such as a clock time or a calendar date, which might be in a variety of lengths, and then convert the data to a SAS date, time, or datetime value.

SAS can read date and time values that are delimited by the following characters:

! # $ % & ( ) * + - . / ; < = > ? [ \ ] ^ _ { | } ~

The blank character can also be used.

Only one delimiter can be used for a date. Otherwise, an error message is written to the SAS log. For example, 01/Jan/2007 uses a single delimiter, and can be read by SAS. In the case of 01-Jan/2007, two different delimiters separate the parts of the date, which results in an error message.

**Date and Time Tools by Task**

The following table correlates tasks with various SAS language elements that are available for working with time and date data.

In SAS, a Julian date is a date in the form YYNNN or YYYYNNN, where YY is a two-digit year, YYYY is a four-digit year, and NNN is the ordinal offset from January 1 of the year YY or YYYY. SAS processes Julian dates only for valid SAS dates.

1 In SAS, a Julian date is a date in the form YYNNN or YYYYNNN, where YY is a two-digit year, YYYY is a four-digit year, and NNN is the ordinal offset from January 1 of the year YY or YYYY. SAS processes Julian dates only for valid SAS dates.

SAS also supports these formats and informats:

- ISO 8601 basic and extended forms for dates, times, datetimes, durations, intervals, and time zones. For more information, see “Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 43 and “Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487.

Examples

Example 1: Displaying Date, Time, and Datetime Values as Recognizable Dates and Times

The following example demonstrates how a value might be displayed as a date, a time, or a datetime. Remember to select the SAS language element that converts a SAS date, time, or datetime value to the intended date, time, or datetime format. See the previous tables for examples.

Note:

- Time formats count the number of seconds within a day, so the values are between 0 and 86400.

- DATETIME formats count the number of seconds since January 1, 1960. For datetimes that are greater than 02JAN1960:00:00:01 (integer of 86401), the datetime value is always greater than the time value.
When in doubt, look at the contents of your data set for clues as to which type of value you are dealing with.

This program uses the DATETIME, DATE, and TIMEAMPM formats to display the value 86399 to a date and time, a calendar date, and a time.

```sas
options nodate;
data test;
  Time1=86399;
  format Time1 datetime.;
  Date1=86399;
  format Date1 date9.;
  Time2=86399;
  format Time2 timeampm.;
run;
proc print data=test;
  title 'Same Number, Different SAS Values';
  footnote1 'Time1 is a SAS DATETIME value';
  footnote2 'Date1 is a SAS DATE value';
  footnote3 'Time2 is a SAS TIME value';
run;
footnote;
```

**Output 1.3** Datetime, Date, and Time Values for 86399

<table>
<thead>
<tr>

<td>20JUL2196</td>
<td>11:59:59 PM</td>
</tr>
</tbody>
</table>

*Time1 is a SAS DATETIME value*
*Date1 is a SAS DATE value*
*Time2 is a SAS TIME value*

Example 2: Reading, Writing, and Calculating Date Values

This program reads four regional meeting dates and calculates the dates on which announcements should be mailed.

```sas
data meeting;
  input region $ mtg : mmddyy8.;
  sendmail=mtg-45;
datalines;
N  11-24-12
S  12-28-12
E  12-03-12
W  10-04-12
;
proc print data=meeting;
```
format mtg sendmail date9.;
title 'When To Send Announcements';
run;

**Output 1.4** Calculated Date Values: When to Send Mail

</tbody>
</table>

---

**About Date and Time Intervals**

**Definitions**

**duration**

is an integer representing the difference between any two dates or times or datetimes. Date durations are integer values representing the difference, in the number of days, between two SAS dates. Time durations are decimal values representing the number of seconds between two times or datetimes.

**TIP**

Date and datetimes durations can be easily calculated by subtracting the smaller date or datetime from the larger. When dealing with SAS times, special care must be taken if the beginning and the end of a duration are on different calendar days. Whenever possible, the simplest solution is to use datetimes rather than times.

**interval**

is a unit of measurement that SAS can count within an elapsed period of time, such as DAYS, MONTHS, or HOURS. SAS determines date and time intervals based on fixed points on the calendar, the clock, or both. The starting point of an interval calculation defaults to the beginning of the period in which the beginning value falls, which might not be the actual beginning value specified. For example, if you are using the INTCK function to count the months between two dates, regardless of the actual day of the month specified by the date in the beginning value, SAS treats it as the first of that month.
Syntax

SAS provides date, time, and datetime intervals for counting different periods of elapsed time. You can create multiples of the intervals and shift their starting point. Use them with the INTCK and INTNX functions and with procedures that support numbered lists (such as the PLOT procedure). This is the form of an interval:

\[ \text{name<multiple>_<starting-point>} \]

The terms in an interval have the following definitions:

- **name**
  - is the name of the interval. See the following table for a list of intervals and their definitions.

- **multiple**
  - creates a multiple of the interval. *multiple* can be any positive number. The default is 1. For example, YEAR2 indicates a two-year interval.

- **.starting-point**
  - is the starting point of the interval. By default, the starting point is 1. A value greater than 1 shifts the start to a later point within the interval. The unit for shifting depends on the interval, as shown in the following table. For example, YEAR.3 specifies a yearly period from the first of March through the end of February of the following year.

## Boundaries of Intervals

SAS associates date and time intervals with fixed points on the calendar. For example, the MONTH interval represents the time from the beginning of one calendar month to the next, not a period of 30 or 31 days. When you use date and time intervals (for example, with the INTCK or INTNX functions), SAS bases its calculations on the calendar divisions that are present. Consider the following examples:

**Table 1.4 Using INTCK and INTNX**

<table>
<thead>
<tr>
<th>Example</th>
<th>Results</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>mnthnum1=intck('month', '25aug2000'd, '05sep2000'd);</td>
<td>mnthnum1=1</td>
<td>The number of MONTH intervals the INTCK function counts depends on whether the first day of a month falls within the period.</td>
</tr>
<tr>
<td>mnthnum2=intck('month', '01aug2000'd, '31aug2000'd);</td>
<td>mnthnum2=0</td>
<td></td>
</tr>
<tr>
<td>next=intnx('month', '25aug2000'd, 1);</td>
<td>next represents 01sep2000</td>
<td>The INTNX function produces the SAS date value that corresponds to the beginning of the next interval.</td>
</tr>
</tbody>
</table>
Note: The only intervals that do not begin on the same date in each year are WEEK and WEEKDAY. A Sunday can occur on any date because the year is not divided evenly into weeks.

---

**Single-Unit Intervals**

Single-unit intervals begin at the following points on the calendar:

*Table 1.5  Single-Unit Intervals*

<table>
<thead>
<tr>
<th>Single-Unit Interval</th>
<th>Beginning Point on the Calendar</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAY</td>

</tr>
</thead>
<tbody>
<tr>
<td>MINUTE</td>
<td>each minute</td>
</tr>
<tr>
<td>HOUR</td>
<td>each hour</td>
</tr>
</tbody>
</table>

Multi-Unit Intervals

Multi-Unit Intervals Other Than Multi-Week Intervals

Multi-unit intervals, such as MONTH2 or DAY50, also depend on calendar measures, but they introduce a new problem: SAS can find the beginning of a unit (for example, the first of a month), but where does that unit fall in the interval? For example, does the first of October mark the first or the second month in a two-month interval?

For all multi-unit intervals except multi-week intervals, SAS creates an interval beginning on January 1, 1960, and counts forward from that date to determine where individual intervals begin on the calendar. As a practical matter, when a year can be divided evenly by an interval, think of the intervals as beginning with the current year. Thus, MONTH2 intervals begin with January, March, May, July, September, and November. Consider this example:

**Table 1.7  Month2 Intervals**

<table>
<thead>
<tr>
<th>SAS statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>howmany1=intck('month2','15feb2000'd,'15mar2000'd);</td>
<td>howmany1=1</td>
</tr>
<tr>
<td>count=intck('day50','01oct1998'd,'01jan1999'd);</td>
<td>count=1</td>
</tr>
</tbody>
</table>

In the above example, SAS counts 50 days beginning with January 1, 1960; then another 50 days; and so on. As part of this count, SAS counts one DAY50 interval between October 1, 1998, and January 1, 1999. For example, to determine the date on which the next DAY50 interval begins, use the INTNX function, as follows:

**Table 1.8  Using the INTNX Function**

<table>
<thead>
<tr>
<th>SAS statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>start=intnx('day50','01oct98'd,1);</td>
<td>SAS date value 14200, or Nov 17, 1998</td>
</tr>
</tbody>
</table>

The next interval begins on November 17, 1998.
Time intervals (those that represent divisions of a day) are aligned with the start of the day, that is, midnight. For example, HOUR8 intervals divide the day into the periods 00:00 to 08:00, 8:00 to 16:00, and 16:00 to 24:00 (the next midnight).

Multi-Week Intervals

Multi-week intervals, such as WEEK2, present a special case. In general, weekly intervals begin on Sunday, and SAS counts a week whenever it passes a Sunday. However, SAS cannot calculate multi-week intervals based on January 1, 1960, because that date fell on a Friday, as shown:

**Figure 1.2 Calculating Multi-Week Intervals**

<table>
<thead>
<tr>
<th></th>
<th>Dec</th>
<th>Su</th>
<th>Mo</th>
<th>Tu</th>
<th>We</th>
<th>Th</th>
<th>Fr</th>
<th>Sa</th>
<th>Jan</th>
</tr>
</thead>
<tbody>
<tr>
<td>1959</td>
<td>27</td>
<td>28</td>
<td>29</td>
<td>30</td>
<td>31</td>
<td>1</td>
<td>2</td>
<td>1</td>
<td>1960</td>
</tr>
</tbody>
</table>

Therefore, SAS begins the first interval on Sunday of the week containing January 1, 1960—that is, on Sunday, December 27, 1959. SAS counts multi-week intervals from that point. The following example counts the number of two-week intervals in the month of August 1998:

**Table 1.9 Counting Two-Week Intervals**

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>count=intck('week2','01aug98'D, '31aug98'D);</td>
<td>count=3</td>
</tr>
</tbody>
</table>

To see the beginning date of the next interval, use the INTNX function, as shown here:

**Table 1.10 Using INTNX to See the Beginning Date of an Interval**

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin=intnx('week2','01aug1998'd,1);</td>
<td>“Begin” represents SAS date 14093 or August 02, 1998</td>
</tr>
</tbody>
</table>

The next interval begins on August 16.

**Shifted Intervals**

**Using Shifted Intervals**

Shifting the beginning point of an interval is useful when you want to make the interval represent a period in your data. For example, if your company's fiscal year begins on July 1, you can create a year beginning in July by specifying the YEAR.7 interval. Similarly, you can create a period matching U.S. presidential elections by
specifying the YEAR4.11 interval. This section discusses how to use shifted intervals and how SAS creates them.

How to Use Shifted Intervals

When you shift a time interval by a subperiod, the shift value must be less than or equal to the number of subperiods in the interval. For example, YEAR.12 is valid (yearly periods beginning in December), but YEAR.13 is not. Similarly, YEAR2.25 is not valid because there is no twenty-fifth month in the two-year period.

In addition, you cannot shift an interval by itself. For example, you cannot shift the interval MONTH because the shifting subperiod for MONTH is one month and MONTH contains only one monthly subperiod. However, you can shift multi-unit intervals by the subperiod. For example, MONTH2.2 specifies bimonthly periods starting on the first day of the second month.

How SAS Creates Shifted Intervals

For all intervals except those based on weeks, SAS creates shifted intervals by creating the interval based on January 1, 1960, by moving forward the required number of subperiods, and by counting shifted intervals from that point. For example, suppose you create a shifted interval called DAY50.5. SAS creates a 50-day interval in which January 1, 1960, is day 1. SAS then moves forward to day 5. (Note that the difference, or amount of movement, is four days.) SAS begins counting shifted intervals from that point. The INTNX function demonstrates that the next interval begins on January 5, 1960:

Table 1.11  Using INTNX to Determine When an Interval Begins

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>start=intnx('day50.5','01jan1960'd,1);</td>
<td>SAS date value 4, or Jan 5, 1960</td>
</tr>
</tbody>
</table>

For shifted intervals based on weeks, SAS first creates an interval based on Sunday of the week containing January 1, 1960 (that is, December 27, 1959). Then, it moves forward the required number of days. For example, suppose you want to create the interval WEEK2.8 (biweekly periods beginning on the second Sunday of the period). SAS measures a two-week interval based on Sunday of the week containing January 1, 1960, and begins counting shifted intervals on the eighth day of that. The INTNX function shows the beginning of the next interval:

Table 1.12  Using the INTNX Function to Show the Beginning of the Next Interval

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>start=intnx('week2.8','01jan1960'd,1);</td>
<td>SAS date value 2, or Jan 3, 1960</td>
</tr>
</tbody>
</table>

You can also shift time intervals. For example, HOUR8.7 intervals divide the day into the periods 06:00 to 14:00, 14:00 to 22:00, and 22:00 to 06:00.
Custom Intervals

You can define custom intervals and associate interval data sets with new interval names when you use the INTERVALDS= system option. An interval name cannot be a reserved SAS name. The dates for these intervals are located in a SAS data set that you create. The data set must contain the variable Begin. For each observation, the Begin variable represents the start of an interval. You can specify a second variable, End, to represent the end of the interval, but it is not required. If the End variable is not present in the data set, the end of an interval is inferred by the next Begin variable value. After the custom intervals have been defined, you can use them with the INTCK and INTNX functions just as you would use standard intervals.

The INTERVALDS= system option enables you to increase the number of allowable intervals. In addition to the standard list of intervals (DAY, WEEKDAY, and so on), the names that are listed in INTERVALDS= are valid as well.

Note: Nested custom intervals are not supported.

Retail Calendar Intervals: ISO 8601 Compliant

The retail industry often accounts for its data by dividing the yearly calendar into four 13-week periods, based on one of the following formats: 4-4-5, 4-5-4, and 5-4-4. The first, second, and third numbers specify the number of weeks in the first, second, and third month of each period, respectively. Retail calendar intervals facilitate comparisons across years, because week definitions remain consistent from year to year.

The intervals that are created from the formats can be used in any of the following functions: INTCINDEX, INTCK, INTCYCLE, INTFIT, INTFMT, INTGET, INTINDEX, INTNX, INTSEAS, INTSHIFT, and INTTEST.

The following table lists calendar intervals that are used in the retail industry and that are ISO 8601 compliant.

Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms

Definitions

Integer values for binary integer data are typically stored in one of three sizes: 1 byte, 2 bytes, or 4 bytes. The ordering of the bytes for the integer varies depending on the platform (operating environment) on which the integers were produced.

The ordering of bytes differs between the “big endian” and “little endian” platforms. These colloquial terms are used to describe byte ordering for IBM mainframes (big endian) and for platforms that are based on Intel (little endian). In SAS, the following platforms are considered big endian: AIX, HP-UX, IBM mainframe, Macintosh, and Solaris on SPARC. The following platforms are considered little endian: Intel ABI, Linux, OpenVMS, OpenVMS on HP Integrity Servers, Solaris on x64, Tru64 UNIX, and Windows.

How Bytes Are Ordered Differently

On big endian platforms, the value 1 is stored in binary and is represented here in hexadecimal notation. One byte is stored as 01, 2 bytes as 00 01, and 4 bytes as 00 00 00 01. On little endian platforms, the value 1 is stored in 1 byte as 01 (the same as big endian), in 2 bytes as 01 00, and in 4 bytes as 01 00 00 00.

If an integer is negative, the two's-complement representation is used. The high-order bit of the most significant byte of the integer is set on 1. For example, –2 would be represented in 1, 2, and 4 bytes on big endian platforms as FE, FF FE, and FF FF FF FE, respectively. On little endian platforms, the representation would be FE, FE FF, and FE FF FF FF. These representations result from the output of the integer binary value –2 expressed in hexadecimal notation.

Writing Data Generated on Big Endian and Little Endian Platforms

SAS can read signed and unsigned integers regardless of whether they were generated on a big endian or a little endian platform. Likewise, SAS can write signed and unsigned integers in both big endian and little endian format. The length of these integers can be up to 8 bytes.

The following table shows which format to use for various combinations of platforms. In the Signed Integer column, “no” indicates that the number is unsigned and cannot be negative. “Yes” indicates that the number can be either negative or positive.
## Platform for Which the Data Was Created

<table>
<thead>

</tbody>
</table>
Data Conversions and Encodings

An encoding maps each character in a character set to a unique numeric representation, which results in a table of code points. A single character can have different numeric representations in different encodings. For example, the ASCII encoding for the dollar symbol $ is 24 hexadecimal. The Danish EBCDIC encoding for the dollar symbol $ is 67 hexadecimal. In order for a version of SAS that typically uses ASCII to properly interpret a data set that is encoded in Danish EBCDIC, the data must be transcoded.

Transcoding is the process of moving data from one encoding to another. When SAS is transcoding the ASCII dollar sign to the Danish EBCDIC dollar sign, the hexadecimal representation for the character is converted from the value 24 to the value 67.

To learn the encoding of a particular SAS data set for SAS 9 and later:

1. Locate the data set with SAS Explorer.
2. Right-click the data set.
3. Select Properties from the menu.
4. Click the Details tab.
5. The encoding of the data set is listed, along with other information.

Here are several situations in which data might commonly be transcoded:

- when you share data between two different SAS sessions that are running in different locales or in different operating environments
- when you perform text-string operations such as converting to uppercase or lowercase
- when you display or print characters from another language
- when you copy and paste data between SAS sessions that are running in different locales

For more information about SAS features that are designed to handle Transcoding for NLS from different encodings or operating environments, see SAS National Language Support (NLS): Reference Guide.

Working with Packed Decimal and Zoned Decimal Data

Definitions

Packed decimal
specifies a method of encoding decimal numbers by using each byte to represent two decimal digits. Packed decimal representation stores decimal data with exact precision. The fractional part of the number is determined by the informat or format because there is no separate mantissa and exponent.

An advantage of using packed decimal data is that exact precision can be maintained. However, computations that involve decimal data might become inexact due to the lack of native instructions.

Zoned decimal
specifies a method of encoding decimal numbers in which each digit requires 1 byte of storage. The last byte contains the number's sign as well as the last digit. Zoned decimal data produces a printable representation.

Nibble
specifies 1/2 of a byte.

Types of Data

Packed Decimal Data

A packed decimal representation stores decimal digits in each “nibble” of a byte. Each byte has two nibbles, and each nibble is indicated by a hexadecimal character. For example, the value 15 is stored in two nibbles, using the hexadecimal characters 1 and 5.

The sign indication is dependent on your operating environment. On IBM mainframes, the sign is indicated by the last nibble. With formats, C indicates a positive value, and D indicates a negative value. With informats, A, C, E, and F indicate positive values, and B and D indicate negative values. Any other nibble is invalid for signed packed decimal data. In all other operating environments, the sign is indicated in its own byte. If the high-order bit is 1, the number is negative. Otherwise, the number is positive.

The following information applies to packed decimal data representation:

- You can use the S370FPD format on all platforms to obtain the IBM mainframe configuration.
You can have unsigned packed data with no sign indicator. The packed decimal format and informat handle the representation. The representation is consistent between ASCII and EBCDIC platforms.

The S370FPDU format and informat expect to have an F in the last nibble. A packed decimal expects no sign nibble.

Zoned Decimal Data

The following information applies to zoned decimal data representation:

- A zoned decimal representation stores a decimal digit in the low-order nibble of each byte. For all bytes except the byte that contains the sign, the high-order nibble is the numeric zone nibble (F on EBCDIC and 3 on ASCII).

- The sign can be merged into a byte with a digit, or it can be separate, depending on the representation. But the standard zoned decimal format and informat expect the sign to be merged into the last byte.

- The EBCDIC and ASCII zoned decimal formats produce the same printable representation of numbers. There are two nibbles per byte, each indicated by a hexadecimal character. For example, the value 15 is stored in 2 bytes. The first byte contains the hexadecimal value F1, and the second byte contains the hexadecimal value C5.

Packed Julian Dates

The following information applies to packed Julian dates:

- The two formats and informats that handle Julian dates in packed decimal representation are PDJULI and PDJULG. PDJULI uses the IBM mainframe year computation, whereas PDJULG uses the Gregorian computation.

- The IBM mainframe computation considers 1900 to be the base year, and the year values in the data indicate the offset from 1900 (for example, 98 means 1998, 100 means 2000, and 102 means 2002). 1998 would mean 3898.

- The Gregorian computation allows for two-digit or four-digit years. If you use two-digit years, SAS uses the setting of the YEARCUTOFF= system option to determine the true year.

Platforms That Support Packed Decimal and Zoned Decimal Data

Some platforms have native instructions to support packed and zoned decimal data. Other platforms must use software to emulate the computations. For example, the IBM mainframe has an Add Pack instruction to add packed decimal data, but the platforms that are based on Intel have no such instruction and must convert the decimal data to some other format.
Languages That Support Packed Decimal and Zoned Decimal Data

Several languages support packed decimal and zoned decimal data. The following table shows how COBOL picture clauses correspond to SAS formats and informats.

<table>
<thead>
<tr>
<th>IBM versus COBOL II Clauses</th>
<th>Corresponding S370Fxxx Formats and Informats</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIC S9(X) PACKED-DECIMAL</td>
<td>S370FPDw.</td>
</tr>
<tr>
<td>PIC 9(X) PACKED-DECIMAL</td>
<td>S370FPDUw.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY</td>
<td>S370FZDw.</td>
</tr>
<tr>
<td>PIC 9(W) DISPLAY</td>
<td>S370FZDUw.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY SIGN LEADING</td>
<td>S370FZDLw.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY SIGN LEADING SEPARATE</td>
<td>S370FZDSW.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY SIGN TRAILING SEPARATE</td>
<td>S370FZDTw.</td>
</tr>
</tbody>
</table>

For the packed decimal representation listed in the preceding table, X indicates the number of digits represented, and W is the number of bytes. For PIC S9(X) PACKED-DECIMAL, W is \( \left\lceil \frac{x+1}{2} \right\rceil \). For PIC 9(X) PACKED-DECIMAL, W is \( \left\lceil \frac{x}{2} \right\rceil \). For example, PIC S9(5) PACKED-DECIMAL represents five digits. If a sign is included, six nibbles are needed. \( \left\lceil \frac{5+1}{2} \right\rceil \) has a length of 3 bytes, and the value of W is 3.

You can substitute COMP-3 for PACKED-DECIMAL.

In IBM assembly language, the P directive indicates packed decimal data, and the Z directive indicates zoned decimal data. Here is an excerpt from an assembly language list that shows the offset, the value, and the DC statement:

```
offset  value (in hex)      inst label     directive
+000000 00001C                2 PEX1       DC PL3'1'
+000003 00001D                3 PEX2       DC PL3'-1'
+000006 F0F0C1                4 ZEX1       DC ZL3'1'
+000009 F0F0D1                5 ZEX2       DC ZL3'-1'
```

In PL/I, the FIXED DECIMAL attribute is used in conjunction with packed decimal data. You must use the PICTURE specification to represent zoned decimal data. There is no standardized representation of decimal data for the Fortran or C language.
Summary of Packed Decimal and Zoned Decimal Formats and Informatrs

SAS uses a group of formats and informats to handle packed and zoned decimal data. The following table lists the types of data representation for these formats and informats. The formats and informats that begin with S370 refer to IBM mainframe representation.

</tbody>
</table>
ISO 8601 Formatting Symbols

The following list explains the formatting symbols that are used to notate the values of the ISO 8601 dates, time, datetime, durations, and interval:

- \( n \)
  specifies a number that represents the number of years, months, or days.

- \( P \)
  indicates that the duration that follows is specified by the number of years, months, days, hours, minutes, and seconds.

- \( T \)
  indicates that a time value follows. Any value with a time must begin with T.

  **Requirement**  Time values that are read by the extended notation informats that begin with the characters E8601 must use an uppercase T.

- \( W \)
  indicates that the duration is specified in weeks.

- \( Z \)
  indicates that the time value is the time in Greenwich, England, or UTC, time.

  + | -
  the + indicates the time zone offset to the east of Greenwich, England. The - indicates the time zone offset to the west of Greenwich, England.

- \( yyyy \)
  specifies a four-digit year.

- \( mm \)
  as part of a date, specifies a two-digit month, 01–12.

- \( dd \)
  specifies a two-digit day, 01–1.

- \( hh \)
  specifies a two-digit hour, 00–24.

- \( mm \)
  as part of a time, specifies a two-digit minute, 00–59.

- \( ss \)
  specifies a two-digit second, 00–59.

- \( fff | fffff \)
  specifies an optional fraction of a second using the digits 0–9:

  - \( fff \) uses 1–3 digits for values read by the $N8601B informat and the $N8601E informat.
use 1–6 digits for informats other than the $N8601B and $N8601E informats.

Y indicates that a year value precedes this character in a duration.

M as part of a date, indicates that a month value precedes this character in a duration.

D indicates that a day value precedes this character in a duration.

H indicates that an hour value precedes this character in a duration.

M as part of a time, indicates that a minute value precedes this character in a duration.

S indicates that a seconds value precedes this character in a duration.

Definitions

Local time
is the local time when a time zone is not specified by the TIMEZONE= system option.

Time zone offset
specifies the number of hours and minutes that a time zone is from Universal Coordinate Time (UTC) in the form +|–hh:mm or +|–hhmm.

User local time
is the local time for the time zone that is specified by the TIMEZONE= system option. For more information, see “TIMEZONE= System Option” in SAS System Options: Reference.

UTC
Universal Coordinate Time is the time at the zero meridian, near Greenwich, England. UTC is a datetime value that uses the ISO 8601 basic form yyyymmddThhmmss+|–hhmm or the ISO 8601 extended form yyyy-mm-ddThh:mm:ss+|–hh:mm.

About Dates and Times That Use the ISO 8601 Basic and Extended Notations

ISO 8601 is an international standard for representing dates and time, including many variations for representing dates, times, and intervals. The two main representations of date, time, and datetime values within the ISO 8601 standards are the basic and extended notations. A value is considered extended when delimiters separate the various components within the value, whereas a basic value omits the delimiters. The extended format requires hyphen delimiters for date components (year, month, and day) and colon delimiters for time components (hour,
minute, and second). Spaces are not allowed in any ISO 8601 representation. The structures for each data type require that you fill each placeholder with a value, including adding a zero to single-digit months, days, hours, and minutes. When you specify a datetime value, an uppercase T is the required delimiter between the date and time.

Some of the ISO 8601 formats are for formatting time and datetime values in UTC. The time or datetime value includes a time zone offset, which is a positive or negative number that represents the number of hours a time zone is from the zero meridian. Positive numbers are east of the zero meridian, and negative numbers are west of the zero meridian. The time zone offset at the zero meridian is always zero.

Here are examples of basic and extended notations for ISO 8601 date, time, datetime, and duration values:

- 2018-02-01 is a date that is formatted using the extended notation.
- 125234-0500 is a time with a time zone offset five hours west of the zero meridian and is formatted using the basic notation.
- 2018-02-01T12:52:34+09:00 is a datetime value with a time zone offset nine hours east of the zero meridian and is formatted using the extended notation.
- P20180501T120000 is a duration value that is formatted using the basic notation.

When SAS reads an ISO 8601 value that specifies UTC with a time offset, the time or datetime value is adjusted to account for the offset from the zero meridian.

The SAS ISO 8601 formats for UTC with a time zone offset are based on the following time, datetime, and time zone offsets:

- the zero meridian time or datetime near Greenwich, England. (The offset is always +|–0000 or +|–00:00.)
- the local time or datetime, which uses the zero meridian time with a time zone offset for the local time.
- a zero meridian datetime that uses a time zone offset for the user local time.
- a user local time or datetime, which uses the current time for a time zone with a time zone offset for the user local time.

---

### Basic ISO 8601 Date, Time, and Datetime Values

Basic formats and informats are prefixed with B8601 and take these forms:

- **Date**
  - `yyymmd` (e.g., `20180201`)
- **Time**
  - `hhmss<ffffff>` (e.g., `125234`)
- **Datetime**
  - `yyymmdThhmss<ffffff>` (e.g., `20180201T125234`)
- **Time with time zone**
  - `hhmss<ffffff>+|–hhmm` (e.g., `125234+0900`)
- **Datetime with time zone**
  - `yyymmdThhmss<ffffff>+|–hhmm` (e.g., `20180201T125234+0900`)

SAS uses the formats in the following table to write date, time, and datetime values in the ISO 8601 basic notations from SAS date, time, and datetime values.
<table>

## Extended ISO 8601 Date, Time, and Datetime Values

Extended formats and informats are prefixed with E8601 and take these forms:

- **Date**  
  `yyyy-mm-dd`

- **Time**  
  `hh:mm:ss<ffffff>`

- **Datetime**  
  `yyyy-mm-ddThh:mm:ss<ffffff>`

- **Time with time zone**  
  `hh:mm:ss<ffffff>+|–hh:mm` or `hh:mm:ss<ffffff>Z`

- **Datetime with time zone**  
  `yyyy-mm-ddThh:mm:ss<ffffff>+|–hh:mm` or `yyyy-mm-ddThh:mm:ss<ffffff>Z`

SAS uses the formats in the following table to write date, time, and datetime values in the ISO 8601 extended notations from SAS date, time, and datetime values.

<table>
<thead>

<tr>
<td>always +00:00.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
An asterisk ( * ) is used in place of a date- or time-formatted value that is out-of-range. The asterisk increases the format width.

**Tips for Remembering UTC Formats That Use Time Zone Offsets**

Here are tips to help you remember which format to use for UTC:
- A T in the last two letters is a time value.
- A D in the last two letters is a datetime value.
- A Z in the last two letters is a zero meridian time and a zero meridian offset, except for LZ.
- An L in the last two letters is a zero meridian time with a local or user local time zone offset.
- An X in the last two letters is for user local time or datetime and uses a user local time zone offset that is determined by the TIMEZONE= system option.

Here is information to help you determine the format for UTC:

<table>
<thead>
<tr>
<th>TZ or DZ</th>
<th>LZ</th>
<th>LX</th>
<th>TX or DX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zero meridian</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>date or datetime</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>that uses a zero</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>meridian time</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>zone offset</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Zero meridian</td>
<td></td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>time that uses</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a local time zone</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>offset</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Examples of Reading and Writing Basic and Extended ISO 8601 Date, Time, and Datetime Values

About the Basic and Extended ISO 8601 Examples

The examples in this section demonstrate how to use various informat to read date, time, and datetime values into SAS date, time, and datetime variables. The examples also illustrate how to use formats to write these values in a way that is meaningful to users.

Comparing ISO 8601 Extended Format Output

This example compares the output for the different extended notations for time and datetime values.

Note: The E8601DX, E8601LX, and E8601TX formats that are used in the example are not supported in CAS.

data _null_;  
d='15Sep2018:5:53:00'dt;  
tm='05:53:00't;  
put 'd=' d datetime.;  
put 'e8601dz=' d e8601dz.;  
put 'e8601lx=' d e8601lx.;  
put 'e8601tx=' d e8601tx.;  
put 'tm=' tm time.;  
put 'e8601tz=' tm e8601tz.;  
put 'e8601lz=' tm e8601lz.;  
put 'e8601tx=' tm e8601tx.;  
run;

The program executed using the local time for the eastern United States and no value for the TIMEZONE= system option. Therefore, the time zone formats E8601LZ., E8601DX., and E8601TX. show local times.
The output for the E8601DZ. and E8601TZ. formats writes a SAS datetime and time value as the time at the zero meridian by using a time zone offset of +0000 or +00:00.

The output for the E8601LX. and E8601LZ. formats writes a SAS datetime value as the time at the zero meridian by using a time zone offset for the local time.

The output for the E8601DX. and E8601TX. formats converts the time to Eastern Time by using a time zone offset for the local time.

Here are the results when the TIMEZONE= option is set to America/Los_Angeles:

<table>
<thead>
<tr>
<th>d</th>
<th>15SEP13:05:53:00</th>
</tr>
</thead>
<tbody>
<tr>
<td>e8601dz</td>
<td>2018-09-15T05:53:00+00:00</td>
</tr>
<tr>
<td>e8601lx</td>
<td>2018-09-15T05:53:00-07:00</td>
</tr>
<tr>
<td>e8601dx</td>
<td>2018-09-14T22:53:00-07:00</td>
</tr>
<tr>
<td>tm</td>
<td>5:53:00</td>
</tr>
<tr>
<td>e8601tz</td>
<td>05:53:00+00:00</td>
</tr>
<tr>
<td>e8601lz</td>
<td>05:53:00-05:00</td>
</tr>
<tr>
<td>e8601tx</td>
<td>21:53:00-08:00</td>
</tr>
</tbody>
</table>

The E8601DZ. and E8601TZ. formats do not change. They always show the time as the time at the zero meridian.

The E8601LX. format shows the zero meridian time by using the time zone offset for the America/Los_Angeles time zone.

The E8601DX. formats show the local date and time in Los Angeles by using the time zone offset for the America/Los_Angeles time zone. The Los Angeles time zone offset of –07:00 indicates that the local time is seven hours earlier than the time at the zero meridian. This changes the date to the 14th.

The E8601LZ. format shows the time at the zero meridian by using the time zone offset for the eastern United States because that is where the code executed.

The E8601TX. format shows the time seven hours earlier from the zero meridian by using a time zone offset for the America/Los_Angeles time zone.

Reading and Writing Date Values

Suppose that you have a clinical trial where an event begins on April 2, 2018, and ends on April 8, 2018. The dates are recorded without time values, as follows: 20180402 and 2018-04-08. You can read these values into SAS with the B8601DAw. and E8601DAw. informats. You can write dates in the same form by using the B8601DAw. and E8601DAw. formats. These formats write the newly created SAS dates in an easy-to-read layout rather than the numeric value of days since 1/1/1960.

data a;
input var1 b8601da8. +1 var2 e8601da10.;
put var1=b8601da. var2=e8601da.;
Here is the output from the SAS log:

```
datalines;
20180402 2018-04-08
;
run;
```

By using the B8601DNw. and E8601DNw. formats, you can extrapolate the date from a datetime value. This example reads the datetime value by using the B8601DNw. informat, and writes the date by using the B8601DNw. format:

```
data _null_;  
input @1 dt b8601dn.;  
put dt b8601dn.;  
datalines;  
20180915T094322  
run;
```

Here is the output from the SAS log:

```
var1=20180402 var2=2018-04-08
```

Reading and Writing Time Values with No Time Zone Offsets

You can read time values that do not have time zone offset values into SAS time values by using the B8601TMw.d and E8601TMw.d informats. The B8601TMw.d and the E8601TMw.d formats write time values that do not have time zone offset values, as shown in this example:

```
data _null_;  
x=input('12:34:56',e8601tm8.);  
put x=b8601tm8. x=e8601tm10.;  
run;
```

Here is the output from the SAS log:

```
x=123456 x=12:34:56
```

Reading and Writing Time Values with Time Zone Offsets

This example uses the E8601TZw.d informat to read a time value that contains a time zone offset. The B8601TZw.d and E8601TZw.d formats write the time values by using a time zone offset for the zero meridian:

```
data _null_;  
x=input('12:34:56-04:00',e8601tm8.);  
put x=e8601tm8. x=e8601tm10.;  
run;
```

Here is the output from the SAS log:

```
x=123456 x=12:34:56
```

Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations
You can adjust a time to be the time in another time zone by using a time zone offset. You specify the time zone by using the TIMEZONE= system option, and then format the time by using the B8601TX. or E8601TX. format. This example writes the time for a user by using the time zone name PST (Pacific Time):

```sas
options timezone=pst;
data _null_;  
x='12:34:56't;  
put x=e8601tx.;  
run;
```

Here is the output from the SAS log:

```
04:34:56-08:00
```

Reading and Writing Time Values with Local Time Zone Offsets

Because time values are scalar, SAS does not typically compute time values based on the time zone of the programmer’s location. One exception to this rule occurs when a SAS time (not a datetime) is computed and then formatted with either the B8601LZ. format or the E8601LZ. format. These two formats query the host code to determine the time zone offset. Then, the current local time and the time zone offset (based on your time zone) are displayed accordingly:

```sas
data _null_;  
x=time();  
put x=e8601lz.;  
run;
```

Here is the output from the SAS log:

```
x=13:49:02-04:00
```

Reading and Writing Datetime Values with No Time Zone Offset

In the following DATA step, SAS reads datetime values with the B8601DT. and E8601DT. informats and writes the datetime values by using the B8601DT. and E8601DT. formats:

```sas
data _null_;  
input dtB :b8601dt15. dtE :e8601dt19.;  
put dtB=b8601dt. dtE=e8601dt.;  
datalines;  
20180402T124022 2018-04-02T12:30:22 ;  
run;
```

Here is the output from the SAS log:
This example reads and writes a Java datetime value and writes the value by using the B8601DTw.d format:

data a;
input dt1 b8601dj.;
put dt1=b8601dt.;
datalines;
20180402123245;
run;

Here is the output from the SAS log:

dt1=20180402T123245

Reading and Writing Datetime Values with Time Zone Offsets

The B8601DZw. and E8601DZw. formats always write a datetime value for the zero meridian. The offset is always +0000 or +00:00.

In this example, SAS reads a datetime value with an offset and writes the datetime value by using an offset for the zero meridian:

data _null_;  
x=input('2018-08-01T12:34:56-04:00',e8601dz25.);
put x=e8601dz25.;
run;

Here is the output from the SAS log:

x=2018-08-01T16:34:56+00:00

You use the B8601DXw. and E8601DXw. formats to adjust a datetime with a time zone offset to be the time for a specific time zone. You set the time zone by using the TIMEZONE= system option. The input value is converted to the time for the time zone and formatted using a time zone offset. This example reads the datetime value with an offset (–04:00) by using the E8601DZw. informat and writes the datetime value for the time zone in Zurich (+02:00):

options timezone='europe/zurich';
data _null_;  
x=input('2018-08-01T12:34:56-04:00',e8601dz25.);
put x=e8601dx25.;
run;

Here is the output from the SAS log:

x=2018-08-01T18:34:56+02:00

In this example, the TIMEZONE= system option sets the time zone ID to America/Anchorage. The datetime value is written for this time zone ID by using the
E8601DXw. format. The time zone offset is the difference between the America/Anchorage time zone and UTC, which is nine hours.

```sas
options timezone='america/anchorage';
data _null_; t='01Feb2018T12:34:56'dt; put t=e8601dx.; run;
```

Here is the output from the SAS log:

```
2018-02-01T03:34:56-09:00
```

Reading and Writing Time and Datetime Values with Time Zone Offsets for Local Times

Because time values are scalar, SAS does not typically compute time values based on the time zone of the programmer’s location. One exception to this rule occurs when a SAS time (not a datetime) is computed and then formatted with either the B8601LZw. format or the E8601LZw. format. These two formats query the host code to determine the offset. Then, the current local time and the offset (based on your time zone) are displayed accordingly:

```sas
data _null_; x=time(); put x=e8601lz.; run;
```

Here is the output from the SAS log:

```
x=13:49:02-04:00
```

You can write a user’s local datetime value by using the time zone offset. Specify the user’s time zone by using the TIMEZONE= system option and the B8601LXw. or E8601LXw. format. This example writes the datetime for a user by using the time zone name PST (Pacific Time):

```sas
options timezone=pst;
data _null_; x='01Feb2018T12:34:56'dt; put x=e8601lx.; run;
```

Here is the output from the SAS log:

```
2018-02-01T12:34:56-07:00
```
Writing ISO 8601 Duration, Datetime, and Interval Values

Duration, Datetime, and Interval Formats

A *duration* is the period of time that is the difference between two time points. Each time point begins with P and is followed by the date and time in either basic or extended notation. Durations can be negative or positive values and can be expressed in these forms:

- `PyyyyymmddTThhmmss.`
- `Pyyyy-mm-ddThh:mm:ss.`
- `Pyyyy-mm-dd` is a span of years, months, and days.
- `PnYnMnDTnHnMnSnS` is the number of years (Y), months (M), days (D), hours (H), minutes (M), and seconds (S).
- `PnW` specifies the number of weeks.

The *y*, *m*, and *d* placeholders must have a value, even if the value is 0.

The *n* placeholder can be 0 or a positive number. The component that contains an *n* can be omitted. For example, `P0Y0M3DT0H0M0S` can be written as `P3D`.

When you use the `PnW` notation, *W* must be the only component in the duration.

An interval comprises two values that represent the beginning and end of an event, and it is a duration that is anchored to a specific point in time. Intervals are represented in the following forms:

- `datetime/datetime`
- `datetime/duration`
- `duration/datetime`

SAS writes duration, datetime, and interval values from character data by using these formats:

<table>
<thead>
<tr>
<th>Time Component</th>
<th>ISO 8601 Notation</th>
<th>Example</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration - Basic Notation</td>
<td><code>PyyyyymmddTThhmmssfff</code></td>
<td>P20180915T155300</td>
<td>$N8601BA</td>
</tr>
<tr>
<td></td>
<td>–<code>Pyyyyymmdd Thhmmssfff</code></td>
<td>–P20180915T155300</td>
<td>$N8601BA</td>

</tr>
<tr>
<td>Datetime - Extended Notation</td>
<td>yyyy-mm-ddThh:mm:ssfff+</td>
<td>--hhmm</td>
<td>2018-09-15T15:53:00/2018-09-15T15:53:00</td>
</tr>
</tbody>
</table>
Writing Partial and Missing Components

When any component of a date or time is not provided, it is called a partial value, and the components are considered missing. You can represent a missing component in a value by using a hyphen ( - ) or an x. A single hyphen represents the entire value for a given component. For example, one single hyphen can replace a four-digit year. A single x represents one character for a given component. A missing two-digit month would be written as xx. If the time portion is omitted when a date value is specified, the T must also be omitted.

Missing components in the durations form PnYnMnDTnHnMnS are dropped; they do not contain a hyphen or an x. For example, in P2mT4H, the year, day, minutes, and seconds are missing and have been dropped.

Do not confuse missing components with zero values. The durations P3D and P0000-00-03 are not the same because a component value of 0 is not the same as a missing component value. Change instances of 0 to x (Pxxxx-xx-03) for this value to be considered the equivalent of P3D.

Missing components are not allowed for values that contain a time zone offset. Therefore, use 00 in place of omitted components.

The following formats write omitted components that use the hyphen and the x:

<table>
<thead>
<tr>
<th>Format</th>
<th>Datetime Form</th>
<th>Duration Form</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>$N8601H</td>
<td>yyyy-mm-ddThh:mm:ss</td>
<td>PnYnMnDTnHnMnS</td>
<td>--09-15T15:--53</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>P2Y2DT4H5M6S/--09-15T15:--00</td>
</tr>
<tr>
<td>$N8601EH</td>
<td>yyyy-mm-ddThh:mm:ss</td>
<td>Pyyyy-mm-ddThh:mm:ss</td>
<td>P000-02T02:55:20/2018-15T--:45</td>
</tr>
<tr>
<td>$N8601X</td>
<td>yyyy-mm-ddThh:mm:ss</td>
<td>PnYnMnDTnHnMnS</td>
<td>P2Y2DT4H5M6S/xxxx-09-15T15:xx:00</td>
</tr>
</tbody>
</table>

Datetime values with missing components that are formatted with either the $N8601B. format or the $N8601BA. format are formatted in the extended notation that uses the hyphen for missing components to ensure accurate data. For example, when the month is the missing component, the value 2018---15 is written, and not 2018-15.

The extended notation with hyphens is also used instead of the basic notation if a duration is formatted using the $N8601BA. format. Using the same date, P2018---15 is written, and not P2018-15.

Writing Truncated Duration, Datetime, and Interval Values

Duration, datetime, and interval values can be truncated when one or more lower-order values are 0 or are not significant. When SAS writes a truncated value that
uses the formats $N8601B., $N8601BA., $N8601E., and $N8601EA., the display of the value stops at the last nonmissing component.

When you format a truncated value by using either the $N8601H. format or the $N8601EH. format, the lower-order components are written with a hyphen. When you format a truncated value that uses the $N8601X. format or the $N8601EX. format, the lower-order components are written with an x.

These examples show truncated values:
- p00030202T1031
- 2016-09-15T15/2018-09-15T15:53
- -p0003-03-03T-:-:-
- P2y3m4dT5h6m
- 2018-09-xxTxx:xx:xx
- 2018

Normalizing Duration Components

When a value for a duration component is greater than the largest standard value for a component, SAS normalizes the component except when the duration component is a single component. The following table shows examples of normalized duration components:

<table>
<thead>
<tr>
<th>Duration</th>
<th>Extended Normalized Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>p3y13m</td>
<td>p0004-01</td>
</tr>
<tr>
<td>pt24h24m65s</td>
<td>P----01T-:25:05</td>
</tr>
<tr>
<td>p3y13mT24h61m</td>
<td>P0004-01-01T01:01</td>
</tr>
<tr>
<td>p0004-13</td>
<td>p0005-01</td>
</tr>
<tr>
<td>p0003-02-61T15:61:61</td>
<td>P0003-04-01T16:02:01</td>
</tr>
<tr>
<td>p13m</td>
<td>P13M</td>
</tr>
</tbody>
</table>

If a component contains the largest value such as 60 for minutes or seconds, SAS normalizes the value and replaces the value with a hyphen. For example, pT12:60:13 becomes PT13:--:13.

Thirty days is used to normalize a month.

Dates and times in a datetime value that are greater than the standard value for the component are not normalized. They produce an error.

Fractions in Duration, Datetime, and Interval Values

Ending components can contain a fraction that consists of a period or a comma, followed by one to three digits. These examples show the use of fractions in values for duration, datetime, and interval:
Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations

Additional formats are documented in these publications:

- "DS2 Formats" in SAS DS2 Language Reference
- "FedSQL Formats" in SAS FedSQL Language Reference

Formats by Category

There are five categories of formats in this list:
<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAS</td>
<td>Instructs SAS to write character data values from character variables in CAS.</td>
</tr>
<tr>
<td>Character</td>
<td>Instructs SAS to write character data values from character variables.</td>
</tr>
<tr>
<td>Date and Time</td>
<td>Instructs SAS to write data values from variables that represent dates, times, and datetimes.</td>
</tr>
<tr>
<td>ISO 8601</td>
<td>Instructs SAS to write date, time, and datetime values using the ISO 8601 standard.</td>
</tr>
<tr>
<td>Numeric</td>
<td>Instructs SAS to write numeric data values from numeric variables.</td>
</tr>
</tbody>
</table>

Formats that support national languages can be found in *SAS National Language Support (NLS): Reference Guide*.

Storing user-defined formats is an important consideration if you associate these formats with variables in permanent SAS data sets, especially those data sets shared with other users. For information about creating and storing user-defined formats, see “FORMAT Procedure” in *Base SAS Procedures Guide*.

The following table provides brief descriptions of the SAS formats. For more detailed descriptions, see the dictionary entry for each format.

### Formats by Category

<table>
<thead>
<tr>
<th>Category</th>
<th>Language Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAS</td>
<td>$BASE64Xw. Format (p. 101)</td>
<td>Converts character data into ASCII text by using Base 64 encoding.</td>
</tr>
<tr>
<td></td>
<td>$BINARYw. Format (p. 102)</td>
<td>Converts character data to binary representation.</td>
</tr>
<tr>
<td></td>
<td>$CHARw. Format (p. 103)</td>
<td>Writes standard character data.</td>
</tr>
<tr>
<td></td>
<td>$CSTR Format (p. 104)</td>
<td>Looks for the last non-blank character of a character argument and passes a copy of the string with a null terminator after the last non-blank character.</td>
</tr>
<tr>
<td></td>
<td>$HEXw. Format (p. 107)</td>
<td>Converts character data to hexadecimal representation.</td>
</tr>
<tr>
<td></td>
<td>$OCTALw. Format (p. 125)</td>
<td>Converts character data to octal representation.</td>
</tr>
<tr>
<td></td>
<td>$QUOTEw. Format (p. 126)</td>
<td>Writes data values that are enclosed in double quotation marks.</td>
</tr>
<tr>
<td></td>
<td>$REVERJw. Format (p. 128)</td>
<td>Writes character data in reverse order and preserves blanks.</td>
</tr>
<tr>
<td></td>
<td>$REVERSw. Format (p. 129)</td>
<td>Writes character data in reverse order and left-aligns</td>
</tr>
<tr>
<td></td>
<td>$UPCASEw. Format (p. 130)</td>
<td>Converts character data to uppercase.</td>
</tr>
<tr>
<td>Category</td>
<td>Language Elements</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>$UUIDw. Format</td>
<td>(p. 131)</td>
<td>Converts character data to the Universally Unique Identifier (UUID) format.</td>
</tr>
<tr>
<td>BESTw. Format</td>
<td>(p. 135)</td>
<td>SAS chooses the best notation.</td>
</tr>
<tr>
<td>BESTDw.p Format</td>
<td>(p. 137)</td>
<td>Prints numeric values, lining up decimal places for values of similar magnitude, and prints integers without decimals.</td>
</tr>
<tr>
<td>COMMAw.d Format</td>
<td>(p. 155)</td>
<td>Writes numeric values with a comma that separates every three digits and a period that separates the decimal fraction.</td>
</tr>
<tr>
<td>COMMAXw.d Format</td>
<td>(p. 156)</td>
<td>Writes numeric values with a period that separates every three digits and a comma that separates the decimal fraction.</td>
</tr>
<tr>
<td>Dw.p Format</td>
<td>(p. 158)</td>
<td>Prints numeric values, possibly with a great range of values, lining up decimal places for values of similar magnitude.</td>
</tr>
<tr>
<td>DATEw. Format</td>
<td>(p. 160)</td>
<td>Writes date values in the form ddmmmyy, ddmmmyyyy, or dd-mmm-yyyy.</td>
</tr>
<tr>
<td>DATEAMPMw.d Format</td>
<td>(p. 161)</td>
<td>Writes datetime values in the form ddmmmyy:hh:mm:ss.ss with AM or PM.</td>
</tr>
<tr>
<td>DATETIMEw.d Format</td>
<td>(p. 163)</td>
<td>Writes datetime values in the form ddmmmyy:hh:mm:ss.ss.</td>
</tr>
<tr>
<td>DAYw. Format</td>
<td>(p. 165)</td>
<td>Writes date values as the day of the month.</td>
</tr>
<tr>
<td>DDMMYyw. Format</td>
<td>(p. 166)</td>
<td>Writes date values in the form ddm&lt;yy&gt;yy or dd/mm/&lt;yy&gt;yy, where a forward slash is the separator and the year appears as either two or four digits.</td>
</tr>
<tr>
<td>DDMMYYxw. Format</td>
<td>(p. 168)</td>
<td>Writes date values in the form ddm&lt;yy&gt;yy or dd-mm-yy&lt;yy&gt;, where the x in the format name is a character that represents the special character that separates the day, month, and year. The special character can be a blank character, colon (:), hyphen (-), no separator, period (.), or slash (/). The year can be either two or four digits.</td>
</tr>
<tr>
<td>DOLLARw.d Format</td>
<td>(p. 170)</td>
<td>Writes numeric values with a leading dollar sign, a comma that separates every three digits, and a period that separates the decimal fraction.</td>
</tr>
<tr>
<td>DOLLARXw.d Format</td>
<td>(p. 171)</td>
<td>Writes numeric values with a leading dollar sign, a period that separates every three digits, and a comma that separates the decimal fraction.</td>
</tr>
<tr>
<td>DOWNNAMEw. Format</td>
<td>(p. 173)</td>
<td>Writes date values as the name of the day of the week.</td>
</tr>
<tr>
<td>DTMONYYw. Format</td>
<td>(p. 175)</td>
<td>Writes the date part of a datetime value as the month and year in the form mmmyy or mmmyyyy.</td>
</tr>
<tr>
<td>Category</td>
<td>Language Elements</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DTWKDATXw.</td>
<td>Format (p. 176)</td>
<td>Writes the date part of a datetime value as the day of the week and the date in the form day-of-week, dd month-name yy (or yyyy).</td>
</tr>
<tr>
<td>DTYEARw.</td>
<td>Format (p. 178)</td>
<td>Writes the date part of a datetime value as the year in the form yy or yyyy.</td>
</tr>
<tr>
<td>DTYYQCw.</td>
<td>Format (p. 179)</td>
<td>Writes the date part of a datetime value as the year and the quarter and separates them with a colon (;).</td>
</tr>
<tr>
<td>Ew.</td>
<td>Format (p. 180)</td>
<td>Writes numeric values in scientific notation.</td>
</tr>
<tr>
<td>E8601DAw.</td>
<td>Format (p. 181)</td>
<td>Writes date values by using the ISO 8601 extended notation yyyy-mm-dd.</td>
</tr>
<tr>
<td>E8601DNw.</td>
<td>Format (p. 182)</td>
<td>Writes dates from SAS datetime values by using the ISO 8601 extended notation yyyy-mm-dd.</td>
</tr>
<tr>
<td>E8601DTw.d</td>
<td>Format (p. 183)</td>
<td>Writes datetime values by using the ISO 8601 extended notation yyyy-mm-ddTh:mm:ss.ffffff.</td>
</tr>
<tr>
<td>E8601DZw.</td>
<td>Format (p. 187)</td>
<td>Writes datetime values for the zero meridian Coordinated Universal Time (UTC) by using the ISO 8601 datetime and time zone extended notation yyyy-mm-ddTh:mm:ss+00:00.</td>
</tr>
<tr>
<td>E8601LZw.</td>
<td>Format (p. 190)</td>
<td>Writes time values as local time, appending the Coordinated Universal Time (UTC) offset for the local SAS session, using the ISO 8601 extended time notation hh:mm:ss+</td>
</tr>
<tr>
<td>E8601TMw.d</td>
<td>Format (p. 192)</td>
<td>Writes time values by using the ISO 8601 extended notation hh:mm:ss.ffffff.</td>
</tr>
<tr>
<td>E8601TZw.d</td>
<td>Format (p. 195)</td>
<td>Adjusts time values to the Coordinated Universal Time (UTC) and writes the time values by using the ISO 8601 extended notation hh:mm:ss.&lt;fff&gt;+</td>
</tr>
<tr>
<td>FLOATw.d</td>
<td>Format (p. 202)</td>
<td>Generates a native single-precision, floating-point value by multiplying a number by 10 raised to the dth power.</td>
</tr>
<tr>
<td>FRACTw.</td>
<td>Format (p. 204)</td>
<td>Converts numeric values to fractions.</td>
</tr>
<tr>
<td>HEXw.</td>
<td>Format (p. 205)</td>
<td>Converts real binary (floating-point) values to hexadecimal representation.</td>
</tr>
<tr>
<td>HHMMw.d</td>
<td>Format (p. 206)</td>
<td>Writes time values as hours and minutes in the form hh:mm.</td>
</tr>
<tr>
<td>HOURw.d</td>
<td>Format (p. 208)</td>
<td>Writes time values as hours and decimal fractions of hours.</td>
</tr>
<tr>
<td>IEEEEw.d</td>
<td>Format (p. 213)</td>
<td>Generates an IEEE floating-point value by multiplying a number by 10 raised to the dth power.</td>
</tr>
<tr>
<td>JULIANw.</td>
<td>Format (p. 215)</td>
<td>Writes date values as Julian dates in the form yyddd or yyyyddydd.</td>
</tr>
<tr>
<td>Category</td>
<td>Language Elements</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MDYAMPMw.d Format</td>
<td></td>
<td>Writes datetime values in the form mm/dd/yy&lt;yy&gt; hh:mm AM</td>
</tr>
<tr>
<td>MMDDYYw. Format</td>
<td></td>
<td>Writes date values in the form mmd&lt;yy&gt;yy or mm/dd/&lt;yy&gt;yy, where a forward slash is the separator and the year appears as either two or four digits.</td>
</tr>
<tr>
<td>MMDDYYxw. Format</td>
<td></td>
<td>Writes date values in the form mmd&lt;yy&gt;yy or mm-dd-&lt;yy&gt;yy, where the x in the format name is a character that represents the special character that separates the month, day, and year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator; the year can be either two or four digits.</td>
</tr>
<tr>
<td>MMSSw.d Format</td>
<td></td>
<td>Writes time values as the number of minutes and seconds since midnight.</td>
</tr>
<tr>
<td>MMYYw. Format</td>
<td></td>
<td>Writes date values in the form mmM&lt;yy&gt;yy, where M is the separator and the year appears as either two or four digits.</td>
</tr>
<tr>
<td>MMYYxw. Format</td>
<td></td>
<td>Writes date values in the form mm&lt;yy&gt;yy or mm-&lt;yy&gt;yy, where the x in the format name is a character that represents the special character that separates the month and the year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator. The year can be either two or four digits.</td>
</tr>
<tr>
<td>MONNAMEw. Format</td>
<td></td>
<td>Writes date values as the name of the month.</td>
</tr>
<tr>
<td>MONTHw. Format</td>
<td></td>
<td>Writes date values as the month of the year.</td>
</tr>
<tr>
<td>MONYYw. Format</td>
<td></td>
<td>Writes date values as the month and the year in the form mmm&lt;yy&gt; or mmm&lt;yyyy&gt;.</td>
</tr>
<tr>
<td>NEGPARENw.d Format</td>
<td></td>
<td>Writes negative numeric values in parentheses.</td>
</tr>
<tr>
<td>NLBESTw. Format</td>
<td></td>
<td>Writes the best numerical notation based on the locale.</td>
</tr>
<tr>
<td>NLDATEw. Format</td>
<td></td>
<td>Converts a SAS date value to the date value of the specified locale, and then writes the date value as a date.</td>
</tr>
<tr>
<td>NLDATELw. Format</td>
<td></td>
<td>Converts a SAS date value to the date string of the specified locale, and then writes the date value as a date in the format month, date, year.</td>
</tr>
<tr>
<td>NLDATEmw. Format</td>
<td></td>
<td>Converts a SAS date value to the date string of the specified locale, and then writes the date value as a date in a medium-uniform pattern.</td>
</tr>
<tr>
<td>NLDATEmDw. Format</td>
<td></td>
<td>Converts the SAS date value to the date value of the specified locale, and then writes the value as the name of the month and the day of the month.</td>
</tr>
<tr>

</table>
Dictionary

$ASCIIw$. Format

Converts native format character data to ASCII representation.

- **Category:** Character
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

**Syntax**

```
$ASCII
```

**Syntax Description**

- **`w`** specifies the width of the output field.

  - **Default:** 1
  - **Range:** 1–32767

**Details**

If ASCII is the native format, no conversion occurs.

**Comparisons**

- On EBCDIC systems, $ASCIIw$. converts EBCDIC character data to ASCIIw.
- On all other systems, $ASCIIw$. behaves like the $CHARw$. format.

**Example**

```plaintext
data one;
    input x $;
    datalines;
    abc
    ABC
    ()*
    ;
    run;

data two;
    set one;
    put x $ascii3.;
```
SAS writes the following results to the log:

| abc  | ABC | {}* |

### $BASE64Xw. Format

Converts character data into ASCII text by using Base 64 encoding.

**Categories:** CAS  
Character  

**Alignment:** Left

#### Syntax

$BASE64Xw.$

**Syntax Description**

*w*  
specifies the width of the output field.  

You can use the following formula to determine the width:

format-width=(variable-length+2)/3*4

When the variable-length+2 is divided by 3, the results are truncated to an integer and multiplied by 4. For example, if a variable length is 48, the width calculation is (48+2)/3*4=64.

If the format width is too small, the value is not converted. No message is written to the SAS log.

**Default** 1  
**Range** 1–32767

#### Details

Base 64 is an industry encoding method whose encoded characters are determined by using a positional scheme that uses only ASCII characters. Several Base 64 encoding schemes have been defined by the industry for specific uses, such as email or content masking. SAS maps positions 0–61 to the characters A–Z, a–z, and 0–9. Position 62 maps to the character +, and position 63 maps to the character /.

Here are some uses of Base 64 encoding:

- embed binary data in an XML file
- encode passwords
encode URLs

If the encoded results contain the ‘=’ character, it indicates that the results have been padded with zero bits. In order for the encoded characters to be decoded, the ‘=’ must be included in the value to be decoded.

Example

data one;
  input x :$30.;
  datalines;
  FCA01A7993BC
  MyPassword
  www.mydomain.com/myhiddenURL
 ;
run;

data two;
  set one;
  put x $base64x64.;
run;

RkNBMDFBk5M0JDICAgICAgICAgICAgICAgICAg
TXlQYXNzd29yZCAgICAgICAgICAgICAgICAg
d3d3Lm15ZG9tYWluLmNvbS9teWhpZGRlblVSTCAg

- The LIBNAME statement option “XMLDOUBLE=DISPLAY | INTERNAL” in SAS XMLV2 and XML LIBNAME Engines: User’s Guide

Informats:

- “$BASE64Xw. Informat” on page 510

$BINARYw. Format

Converts character data to binary representation.

Categories: CAS
  Character

Alignment: Left

Syntax

$BINARYw.

Syntax Description

w specifies the width of the output field.
The default width is calculated based on the length of the variable to be printed.

Range: 1–32767

Comparisons

The $BINARYw.$ format converts character values to binary representation. The $BINARYw.$ format converts numeric values to binary representation.

Example: Converting Two Characters to Binary Representation

```sas
data one;
  x='AB';
  put x $binary.;
run;
```

The preceding example writes this output, the binary values of A and B, to the SAS log.

```
x=0100000101000010
```

There is not a blank space between the A and B in the code example, or between their binary representations in the output.

$CHARw. Format

Writes standard character data.

Categories: CAS
Character

Alignment: Left

Syntax

$CHARw.$

Syntax Description

\textit{w} specifies the width of the output field.

Default: 8 if the length of the variable is undefined; otherwise, the length of the variable

Range: 1–32767
Comparisons

- The $CHARw. format is not identical to the $w. format. The $CHARw. format does not trim trailing blanks. The $w. format trims trailing blanks.

- The $CHARw. and $w. formats do not trim leading blanks. To trim leading blanks, use the LEFT function to left-align character data. Alternatively, use the PUT statement with the colon (:) format modifier and the format of your choice to produce list output.

- Use the following table to compare the SAS format $CHAR8. with notation in other programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>$CHAR8.</td>
</tr>
<tr>
<td>C</td>
<td>char [8]</td>
</tr>
<tr>
<td>COBOL</td>
<td>PIC x(8)</td>
</tr>
</tbody>
</table>

Example:

```sas
data one;
  length x $5;
  input x $5. y;
  put x $char. y;
  datalines;
  AB   123
;   run;
```

The preceding example specifies a length value. The example then uses the value when it writes this character data to the SAS log.

AB   123

$CSTR Format

Looks for the last non-blank character of a character argument and passes a copy of the string with a null terminator after the last non-blank character.

Categories:  
CAS  
Character

Syntax

$CSTRw.
Required Argument

\textbf{w}

- specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1–32767</td>
</tr>
</tbody>
</table>

Details

Use the \texttt{$CSTR w$.} format to pass a character argument as a null-terminated string. \texttt{$CSTR$} looks for the last non-blank character of a character argument and passes a copy of the string with a null terminator after the last non-blank character.

Example

```r
data _null_;
  name='XYZ';
  put name $cstr10.;
run;
```

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>put x $cstr. y;</code></td>
<td>XYZ*</td>
<td>xyz</td>
</tr>
</tbody>
</table>

\textbf{Note:} The XYZ name value represents a null character.

\textbf{$EBCDICw$. Format}

Converts native format character data to EBCDIC representation.

\begin{itemize}
  \item \textbf{Category:} Character
  \item \textbf{Alignment:} Left
  \item \textbf{Restriction:} This format is not supported in a DATA step that runs in CAS.
  \item \textbf{Note:} UTF-8 is the only supported session encoding. \texttt{$EBCDIC$} format works only for 7-bit ASCII characters.
\end{itemize}

\textbf{Syntax}

\texttt{$EBCDICw$.}
Syntax Description

w
specifies the width of the output field.

Default   1
Range      1–32767

Details

If EBCDIC is the native format, no conversion occurs.

On ASCII systems, the $EBCDIC{w}. format is based on the default encoding value of the LOCALE= option that is specified when SAS starts. For example, if the locale was set to en_US locale, the default encoding that is used by the $EBCDIC{w}. format is Open_ed-1047. If the locale is de_DE (German_Germany), the default encoding that is used by the $EBCDIC{w}. format is Open_ed–1141. For a list of locales and encoding values, see “Default Values for DFLANG, DATESTYLE, and PAPERSIZE System Options Based on the LOCALE= System Option” in SAS National Language Support (NLS): Reference Guide.

You can specify the translation table that is used to map characters between EBCDIC and ASCII by using the MAPEBCDIC2ASCII system option. For more information, see “MAPEBCDIC2ASCII= System Option” in SAS National Language Support (NLS): Reference Guide.

Comparisons

- On ASCII systems, $EBCDIC{w}. converts ASCII character data to EBCDIC.
- On all other systems, $EBCDIC{w}. behaves like the $CHAR{w}. format.

Example

```sas
data one;
  input x $;
  datalines;
  ABC
  ä
  ö
; run;

data two;
  set one;
  y=put(x,$ebcdic3.);
  put y $HEX6.;
run;
```
Table 2.1  Output Locale Values for American English, French, and German

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Locale Value Is en_US</th>
<th>Locale Value Is fr_FR</th>
<th>Locale Value Is de_DE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABC</td>
<td>C1C2C3</td>
<td>C1C2C3</td>
<td>C1C2C3</td>
</tr>
<tr>
<td>{ä}</td>
<td>C043D0</td>
<td>514354</td>
<td>43C0DC</td>
</tr>
<tr>
<td>[@]</td>
<td>AD7CBD</td>
<td>9044B5</td>
<td>63B5FC</td>
</tr>
</tbody>
</table>

The results are shown as hexadecimal representations of EBCDIC codes for characters. Each pair of hexadecimal characters correspond to one byte of binary data, and each byte corresponds to one character.

$\text{HEXw. Format}$

Converts character data to hexadecimal representation.

Categories: CAS
Character

Alignment: Left

See:
"$\text{HEX Format: UNIX}$" in SAS Companion for UNIX Environments
"$\text{HEXw. Format: Windows}$" in SAS Companion for Windows

Syntax

$\text{HEXw.}$

Syntax Description

$w$
specifies the width of the output field.

Default

The default width is calculated based on the length of the variable to be printed.

Range

1–32767

Tips

To ensure that SAS writes the full hexadecimal equivalent of your data, make $w$ twice the length of the variable or field that you want to represent.

If $w$ is greater than twice the length of the variable that you want to represent, $\text{HEXw.}$ pads it with blanks.
Details
The $HEXw. format converts each character to two hexadecimal characters. Each blank counts as one character, including trailing blanks.

Comparisons
The HEXw. format converts real binary numbers to their hexadecimal equivalent.

Example
```plaintext
data one;
x='AB';
put x $hex4.;
run;
```

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBCDIC</td>
<td>ASCII</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>AB</td>
<td>c1c2</td>
</tr>
</tbody>
</table>

$MSGCASEw. Format
Writes character data in uppercase when the MSGCASE system option is in effect.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax
```
$MSGCASEw.
```

Syntax Description

w

specifies the width of the output field.

Default 1, if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767
Details

When the MSGCASE system option is in effect, all notes, warnings, and error messages that SAS generates appear in uppercase. Otherwise, all notes, warnings, and error messages appear in mixed case. You specify the MSGCASE system option in the configuration file or during the SAS invocation.

Example

data one;
  x='sas';
  put x $msgcase.;
run;

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>sas</td>
<td>SAS</td>
</tr>
</tbody>
</table>

- "MSGCASE System Option: Windows" in SAS Companion for Windows
- "MSGCASE System Option: z/OS" in SAS Companion for z/OS

$N8601Bw.d Format

Writes ISO 8601 duration, datetime, and interval forms by using the basic notations PnYnMnDTnHnMnSnS and yyyyymmddThhmmss.

Categories: Date and Time
ISO 8061
Alignment: Left
Restrictions: This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported. Values greater than 12 are not supported.
Supports: ISO 8061 Element 5.4.4, complete representation

Syntax

$N8601Bw.d
Syntax Description

### Syntax Description

#### w

`w` specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>50</td>
<td>1–200</td>
</tr>
</tbody>
</table>

#### d

`d` specifies the number of digits to the right of the lowest-order component. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0–6</td>
</tr>
</tbody>
</table>

### Details

The `$N8601B` format writes ISO 8601 duration, datetime, and interval values as character data for the following basic notations:

- `PnYnMnDTnHnMnS`
- `yyyyymmddThhmmss`
- `PnYnMnDTnHnMnS/yyyyymmddThhmmss`
- `yyyyymmddThhmmssT/PnYnMnDTnHnMnS`

The lowest-order component can contain fractions, as in these examples:

- `p2y3.5m`
- `p00020304T05.335`

#### Note

Using a month value that is greater than 12 with a datetime value causes an error. For example, the value `201814T000000/2018-09-15T00:00:00` causes an error because the value for the month is 14.

### Examples:

#### Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 8, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the `LENGTH` statement indicates.

```plaintext
data one;
  length mynew $16;
  x='P10w';  /* 1 */
  y='17aug2018:9:41:05.96' dt;  /* 2 */
  call is8601_convert('du/dt','start',x,y,mynew);
  put mynew $n8601b.;
run;
```
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

```plaintext
data one;
  length dur $16;
  start='01apr2017:10:41:51'dt;
  end='15jun2018:12:16:23'dt;
  call is8601_convert('dt/dt','du',start,end,dur); /* 1*/
  put dur $n8601b.;
run;
```

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the `dur` character variable.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dur $n8601b.;</td>
<td>0001214013432FFC</td>
<td>P1Y2M14DT1H34M32S</td>
</tr>
</tbody>
</table>

### $N8601BAw.d Format

**WriteISO 8601 duration, datetime, and interval forms by using the basic notations **

PyyyymmddTthhmms** and yyyyymmddThhmmss.**

**Categories:** Date and Time

ISO 8601

**Alignment:** Left

**Restrictions:** This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported.

**Supports:** ISO 8601 Element 5.5.4.2, alternative format

**Syntax**

`$N8601BAw.d`
Syntax Description

**w**
specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–200</td>
</tr>
<tr>
<td>Requirement</td>
<td>The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.</td>
</tr>
</tbody>
</table>

**d**
specifies the number of digits to the right of the lowest-order component. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>0–6</td>
</tr>
</tbody>
</table>

Details

The $N8601BA format writes ISO 8601 duration, datetime, and interval values as character data for the following basic notations:

- `PyyyyymmddThhmmss`
- `yyyyymmddThhmmss`
- `PyyyyymmddThhmmss/yyyyymmddThhmmss`
- `yyyyymmddThhmmss/PyyyyymmddThhmmss`

The lowest-order component can contain fractions, as in these examples:

- `p00023.5`
- `00020304T05.335`

Examples:

Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```
data one;
  length mynew $16;
  x='P10w';                           /* 1 */
  y='17aug2018:9:41:05.96'dt;         /* 2 */
  call is8601_convert('du/dt','start',x,y,mynew);
  put mynew $n8601ba.;
run;
```

1  X is a duration of 10 weeks.
2  Y is a datetime value.
### Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

```sql
data one;
  length dur $16;
  start='01apr2017:10:41:51'dt;
  end='15jun2018:12:16:23'dt;
  call is8601_convert('dt/dt','du',start,end,dur); /* 1*/
  put dur $n8601ba. ;
run;
```

1. Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the `dur` character variable.

### See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

---

### $N8601Ew.d Format

Writes ISO 8601 duration, datetime, and interval forms by using the extended notations `PnYnMnDTnHnMnS` and `yyyy-mm-ddThh:mm:ss`.

**Categories:** Date and Time  
ISO 8601

**Alignment:** Left

**Restrictions:** This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported.

**Supports:** ISO 8601 Element 5.4.4, complete representation

### Syntax

```
$N8601Ew.d
```
Syntax Description

`w`
specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–200</td>
</tr>
</tbody>
</table>

Requirement
The minimum length for a duration value or a datetime value is 16.
The minimum length for an interval value is 16.

`d`
specifies the number of digits to the right of the lowest-order component. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>0–6</td>
</tr>
</tbody>
</table>

Details
The $N8601E$ format writes ISO 8601 duration, datetime, and interval values as character data for the following basic notations:

- $PnYnMnDTnHnMnS$
- $yyyy-mm-ddThh:mm:ss$
- $PnYnMnDTnHnMnS/yyyy-mm-ddThh:mm:ss$
- $yyyy-mm-ddThh:mm:ss/T/PnYnMnDTnHnMnS$

The lowest-order component can contain fractions, as in these examples:

- $p2y3.5m$
- $p0002–03–04T05.335$

Examples:

Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```
data one;
  length mynew $16;
  x='P10W';     /* 1 */
  y='17aug2018:9:41:05.96'dt;     /* 2 */
  call is8601_convert('du/dt','start',x,y,mynew);
  put mynew $n8601e.;
run;
```

1  X is a duration of 10 weeks.
2  Y is a datetime value.
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

``` SAS
data one;
  length dur $16;
  start='01apr2017:10:41:51'dt;
  end='15jun2018:12:16:23'dt;
  call is8601_convert ('dt/dt','du',start,end,dur);  /* 1 */
  put dur $n8601e.;
run;
```

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the dur character variable.

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

$\text{N8601EA}_W.d \text{ Format}

Writes ISO 8601 duration, datetime, and interval forms by using the extended notations \texttt{Pyyyy-mm-ddTth:mm:ss} and \texttt{yyyy-mm-ddTth:mm:ss}.

**Categories:** Date and Time

**ISO 8601**

**Alignment:** Left

**Restrictions:**

This format is not supported in a DATA step that runs in CAS.

UTC time zone offset values are not supported.

**Supports:** ISO 8601 Element 5.4.4, complete representation

**Syntax**

$\text{N8601EA}_W.d$
Syntax Description

w
specifies the width of the output field.

Default 50
Range 1–200

Requirement The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.

d
specifies the number of digits to the right of the lowest-order component. This argument is optional.

Default 0
Range 0–6

Details

The $N8601EA format writes ISO 8601 duration, datetime, and interval values as character data for the following basic notations:

- Pyyyy-mm-ddThh:mm:ss
- yyyy-mm-ddThh:mm:ss
- Pyyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss
- yyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss

The lowest-order component can contain fractions, as in these examples:

- p00023.5
- 0002-03-04T05.335

Examples:

Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```plaintext
data one;
  length mynew $16;
  x='P10w';            /* 1 */
  y='17aug2018:9:41:05.96'dt;   /* 2 */
  call is8601_convert('du/dt','start',x,y,mynew);
  put mynew $n8601ea.;
run;
```

1 X is a duration of 10 weeks.
2 Y is a datatime value.
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

data one;
    length dur $16;
    start='01apr2017:10:41:51'dt;
    end='15jun2018:12:16:23'dt;
    call is8601_convert('dt/dt','du',start,end,dur);  /* 1*/
    put dur $n8601ea.;
run;

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the dur character variable.

See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

$N8601EHW.d Format

Writes ISO 8601 duration, datetime, and interval forms by using the extended notations Pyyyy-mm- ddThh:mm:ss and yyyy-mm-ddThh:mm:ss, using a hyphen (-) for omitted components.

Categories: Date and Time
ISO 8601

Restrictions: This format is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.4, complete representation

Syntax

$N8601EHW.d
Syntax Description

\(w\)

specifies the width of the output field.

Default

50

Range

1–200

Requirement

The minimum length for a duration value or a datetime value is 16.
The minimum length for an interval value is 16.

\(d\)

d Specifies the number of digits to the right of the lowest-order component. This argument is optional.

Default

0

Range

0–6

Details

The $N8601EH format writes ISO 8601 duration, datetime, and interval values as character data, using a hyphen (-) to represent omitted components, for the following extended notations:

- \(Pyyyy-mm-dd\)T\(hh:mm:ss\)
- yyyy-mm-dd\(T\)hh:mm:ss
- Pyyyy-mm-dd\(T\)hh:mm:ss/yyyy-mm-dd\(T\)hh:mm:ss
- yyyy-mm-dd\(T\)hh:mm:ss/Pyyyy-mm-dd\(T\)hh:mm:ss
- yyyy-mm-dd\(T\)hh:mm:ss/yyyy-mm-dd\(T\)hh:mm:ss

Omitted datetime components are always displayed; they are never truncated.

Examples:

Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds.

```plaintext
data one;
    length mynew $16;
    x='P10w'; /* 1 */
    y='17aug2018:9:41:05.96'dt; /* 2 */
    call is8601_convert('du/dt','start',x,y,mynew);
    put mynew $n8601eh.;
run;
```

1 X is a duration of 10 weeks.
2 Y is a datetime value.
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

```sas
data one;
  length dur $16;
  start='01jun2017:10:41:51'dt;
  end='15jun2018:12:16:23'dt;
  call is8601_convert('dt/dt','du',start,end,dur);  /* 1 */
  put dur $n8601eh.;
run;
```

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the `dur` character variable.

In the table, omitted components of datetimes are represented by a hyphen (-).

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dur $n8601eh.;</td>
<td>0001214013432FFC</td>
<td>P0001---14T01:34:32</td>
</tr>
</tbody>
</table>

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

$N8601EXw.d Format

Writes ISO 8601 duration, datetime, and interval forms by using the extended notations `Pyyyy-mm-ddThh:mm:ss` and `yyyy-mm-ddThh:mm:ss`, using an x for each digit of an omitted component.

**Categories:** Date and Time
ISO 8601

**Alignment:** Left

**Restrictions:** This format is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

**Supports:** ISO 8601 Elements 5.5.3, 5.5.4.1, and 5.5.4.2

**Syntax**

`$N8601EXw.d`
Syntax Description

**w**

specifies the width of the output field.

Default 50

Range 1–200

Requirement The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.

**d**

specifies the number of digits to the right of the lowest-order component. This argument is optional.

Default 0

Range 0–6

Details

The $N8601EX format writes ISO 8601 duration, datetime, and interval values as character data, using a hyphen (-) to represent omitted components, for the following extended notations:

- `Pyyyy-mm-ddThh:mm:ss`
- `yyyy-mm-ddThh:mm:ss`
- `Pyyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss`
- `yyyy-mm-ddThh:mm:ss/Pyyyy-mm-ddThh:mm:ss`
- `yyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss`

Omitted datetime components are always displayed; they are never truncated.

Examples:

**Example 1: Writing a Datetime Value**

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```plaintext
data one;
  length mynew $16;
  x='P10w'; /* 1 */
  y='17aug2018:9:41:05.96' /* 2 */
  put mynew $N8601ex. ;
run;
```

1. X is a duration of 10 weeks.
2. Y is a datetime value.
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

```sas
data one;
  length dur $16;
  start='01jun2017:10:41:51'dt;
  end='15jun2017:12:16:23'dt;
  call is8601_convert('dt/dt','du',start,end,dur); /* 1 */
  put dur $n8601ex.;
run;
```

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the dur character variable.

In the table, omitted components of datetimes are represented by x.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dur $n8601ex.;</td>
<td>0001214013432FFC</td>
<td>P0001-02-14T01:34:3</td>
</tr>
</tbody>
</table>

“Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 43

$N8601Hw.d Format

Writes ISO 8601 duration, datetime, and interval forms PnYnMnDTnHnMnS and yyyy-mm-ddThh:mm:ss, dropping omitted components in duration values and using a hyphen (-) for omitted components in datetime values.

Categories: Date and Time
ISO 8601

Alignment: Left

Restrictions: This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported.

Supports: ISO 8601 Elements 5.5.3, 5.5.4.1, and 5.5.4.2
Syntax

\$N8601H w.d

Syntax Description

\textit{w}

specifies the width of the output field.

- Default: 50
- Range: 1–200
- Requirement: The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.

\textit{d}

specifies the number of digits to the right of the lowest-order component. This argument is optional.

- Default: 0
- Range: 0–6

Details

The \$N8601H format writes ISO 8601 durations, intervals, and datetimes in the following forms, omitting components in the \textit{PnYnMnDTnHnMnS} form and using a hyphen (\text{-}) to represent omitted components in the datetime form:

- \textit{PnYnMnDTnHnMnS}
- \textit{yyyy-mm-ddThh:mm:ss}
- \textit{PnYnMnDTnHnMnS/yyyy-mm-ddThh:mm:ss}
- \textit{yyyy-mm-ddThh:mm:ss/tnYnMnDTnHnMnS}
- \textit{yyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss}

Omitted datetime components are always displayed; they are never truncated.

Examples:

Example 1: Writing a Datetime Value

This example writes a datetime value that represents June 20, 2018, 9 hours, 41 minutes, and 5.96 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```plaintext
data one;
    length mynew $16;
    x='10w'; /* 1*/
y='17aug2018:9:41:05.96'dt; /* 2*/
call is8601_convert('du/dt','start',x,y,mynew);
    put mynew $n8601h.;
run;
```

1 X is a duration of 10 weeks.
Example 2: Writing a Duration Value

This example writes a duration value of 1 year, 2 months, 14 days, 1 hour, 34 minutes, and 32 seconds.

```sas
data one;
  length dur $16;
  start='01jun2017:10:41:51'dt;
  end='15jun2017:12:16:23'dt;
  call is8601_convert('dt/dt','du',start,end,dur); /* 1*/
  put dur $n8601h.;
run;
```

1 Call IS8601_CONVERT computes the duration between datetime variables Start and End. The result is stored in the `dur` character variable.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dur $n8601h.;</td>
<td>0001214013432FFC</td>
<td>P1Y2M14DT1H34M32S</td>
</tr>
</tbody>
</table>

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

$N8601Xw.d Format

Writes ISO 8601 duration, datetime, and interval forms `PnYnMnDTnHnMnS` and `yyyy-mm-ddThh:mm:ss`, dropping omitted components in duration values and using an x for each digit of an omitted component in datetime values.

Categories: Date and Time
ISO 8601

Alignment: Left

Restrictions: This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported.

Supports: ISO 8601 Elements 5.5.3, 5.5.4.1, and 5.5.4.2

Syntax

$N8601Xw.d
Syntax Description

**w**

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–200</td>
</tr>
</tbody>
</table>

**d**

specifies the number of digits to the right of the lowest-order component. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>0–6</td>
</tr>
</tbody>
</table>

Details

The $\text{N8601X}$ format writes ISO 8601 durations, intervals, and datetimes in the following forms, omitting components in the \text{PnYnMnDTnHnMnS} form and using an \text{x} to represent omitted components in the datetime form:

- \text{PnYnMnDTnHnMnS}
- \text{yyyy-mm-ddThh:mm:ss}
- \text{PnYnMnDTnHnMnS/yyyy-mm-ddThh:mm:ss}
- \text{yyyy-mm-ddThh:mm:ss/PnYnMnDTnHnMnS}
- \text{yyyy-mm-ddThh:mm:ss/yyyy-mm-ddThh:mm:ss}

Omitted datetime components are always displayed; they are never truncated.

Example

This example writes a datetime value that represents June 5, 2018, 10 hours, 15 minutes, and 20 seconds. This newly computed datetime is a character variable, as the LENGTH statement indicates.

```plaintext
data one;
  input y mo d h min s;
  length dt $16;
  call is8601_convert('dt6','start',y,mo,d,h,min,s,dt);
  put dt $n8601x.;
datalines;
2018 6 . 10 15 20
2018 . 5 10 15 20
;
run;
```

In the table, omitted components of datetimes are represented by \text{x}.
<table>
<thead>
<tr>
<th>Statement</th>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dt $n8601x.;</td>
<td>2018FF101520001</td>
<td>2018-06-xxT10:15:20</td>
</tr>
<tr>
<td>put dt $n8601x.;</td>
<td>2018F05101520001</td>
<td>2018-xx-05T10:15:20</td>
</tr>
</tbody>
</table>

See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

$OCTALw. Format

Converts character data to octal representation.

Categories: CAS
Character

Alignment: Left

Syntax

$OCTALw.

Syntax Description

\( w \)

specifies the width of the output field.

Default

The default width is calculated based on the length of the variable to be printed.

Range

1–32767

Tip

Because each character value generates three octal characters, increase the value of \( w \) by three times the length of the character value.

Comparisons

The $OCTALw. format converts character values to the octal representation of their character codes. The OCTALw. format converts numeric values to octal representation.

Example

The following example shows ASCII output when you use the $OCTALw. format.

```plaintext
data _null_; infile datalines truncover; input item $5.;
```
put item $octal15.;
datalines;
art
rice
bank
;
run;

SAS writes the following results to the log.

```
141162164040040
162151143145040
142141156153040
```

$QUOTEw. Format

Writes data values that are enclosed in double quotation marks.

Categories: CAS Character

Alignment: Left

Syntax

$QUOTEw.

Syntax Description

$QUOTEw.

w specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2, if the length of the variable is undefined. Otherwise, the default is the length of the variable plus 2</td>
</tr>
</tbody>
</table>

| Range | 1–32767 |

| Tip | Make $QUOTEw$ wide enough to include the left and right quotation marks.

Details

This list describes the output that SAS produces when you use the $QUOTEw. format. For examples of these items, see the examples that follow the list.

- If your data value is not enclosed in quotation marks, SAS encloses the output in double quotation marks.
- If your data value is not enclosed in quotation marks, but the value contains a single quotation mark, SAS behaves in one of these ways:
  - encloses the data value in double quotation marks
  - leaves the single quotation mark
If your data value begins and ends with single quotation marks, and the value contains double quotation marks, SAS behaves in one of these ways:
- encloses the data value in double quotation marks
- duplicates the double quotation marks that are found in the data value
- leaves the single quotation marks

If your data value begins and ends with single quotation marks, and the value contains two single contiguous quotation marks, SAS behaves in one of these ways:
- encloses the value in double quotation marks
- leaves the single quotation marks

If your data value begins and ends with single quotation marks, and contains both double quotation marks and single, contiguous quotation marks, SAS behaves in one of these ways:
- encloses the value in double quotation marks
- duplicates the double quotation marks that are found in the data value
- leaves the single quotation marks

If the length of the target field is not large enough to contain the string and its quotation marks, SAS returns as much of the quoted string as fits in the field. The result contains leading and trailing quotation marks, and the value is truncated to ensure enough room in the field for the quotation marks. For example, if the specified value is ABCDE and you specify $QUOTE5., the DE in the value is truncated and the result is "ABC".

---

**Note:** An embedded quotation mark must be enclosed within additional quotation marks. If you specify a value of A"B, then $QUOTE5. truncates the B in the value and writes "A"".

---

**Example**

```sas
data test;
  input original $19.;
  format original $quote20.;
datalines;
SAS
SAS's
'ad"verb"'
'ad''verb'
"ad''''verb"
deoxyribonucleotide
;
run;
proc print noobs; run;
```

**Value of original**  **Result**

<table>
<thead>
<tr>
<th>Value of original</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;ad&quot;verb&quot;</td>
<td>&quot;ad&quot;verb&quot;</td>
</tr>
<tr>
<td>&quot;ad''verb&quot;</td>
<td>&quot;ad''verb&quot;</td>
</tr>
<tr>
<td>&quot;ad''''verb&quot;</td>
<td>&quot;ad''''verb&quot;</td>
</tr>
<tr>
<td>deoxyribonucleotide</td>
<td></td>
</tr>
</tbody>
</table>

---
<table>
<thead>
<tr>
<th>Value of original</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>&quot;SAS&quot;</td>
</tr>
<tr>
<td>SAS's</td>
<td>&quot;SAS's&quot;</td>
</tr>
<tr>
<td>'ad''verb''</td>
<td>''ad''verb''</td>
</tr>
<tr>
<td>&quot;ad''''''verb''&quot;</td>
<td>&quot;ad''''''verb''&quot;</td>
</tr>
<tr>
<td>deoxyribonucleotide</td>
<td>&quot;deoxyribonucleotide&quot;</td>
</tr>
</tbody>
</table>

1 deoxyribonucleotide is 19 characters. When SAS adds the quotation marks, the length of the string is 21 characters. SAS truncates the letter e at the end of the text to accommodate the quotation marks.

$REVERJw. Format

Writes character data in reverse order and preserves blanks.

Categories: CAS Character

Alignment: Right

Syntax

$REVERJw.

Syntax Description

w specifies the width of the output field.

Default 1, if w is not specified

Range 1–32767

Comparisons

The $REVERJw. format is similar to the $REVERSw. format except that $REVERSw. left-aligns the result by trimming all leading blanks.

Example

data _null_;  
x='ABCD   ';
$REVERSw. Format

Writes character data in reverse order and left-aligns

<table>
<thead>
<tr>
<th>Categories:</th>
<th>CAS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
<td></td>
</tr>
<tr>
<td>Alignment:</td>
<td>Left</td>
</tr>
</tbody>
</table>

### Syntax

$REVERSw.

#### Syntax Description

**w**

specifies the width of the output field.

- **Default**: 1 if *w* is not specified
- **Range**: 1–32767

### Comparisons

The $REVERSw. format is similar to the $REVERJw. format except that $REVERJw. does not left-align the result.

### Example

data _null_
  x='ABCD   ';
  put x $revers7.;
  y='   ABCD';
  put y $revers7.;
run;
$UPCASEw. Format

Converts character data to uppercase.

**Categories:**
- CAS
- Character

**Alignment:** Left

**Syntax**

\$UPCASEw.

**Syntax Description**

\( w \)

Specifies the width of the output field.

**Default**

- 8, if the length of the variable is undefined. Otherwise, the default is the length of the variable.

**Range**

1–32767

**Details**

Special characters, such as hyphens and other symbols, are not altered.

**Example**

```sql
data one;
  name='coxe-ryan';
  put name $upcase9.;
run;
```

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>coxe-ryan</td>
<td>COXE-RYAN</td>
</tr>
</tbody>
</table>
**$UUIDw. Format**

Converts character data to the Universally Unique Identifier (UUID) format.

**Categories:**
- CAS
- Character

**Alignment:** Left

**Syntax**

$UUIDw$

**Arguments**

w specifies the width of the output field.

**Range** 1–200

**Details**

The value to be formatted must be a 16-byte binary value. The $UUID format displays the binary data with hexadecimal characters and hyphens as delimiters. If you specify the value in a format other than hexadecimal, the returned UUID is the hexadecimal representation of the original characters.

**Note:** In this example, the binary value is set via a hexadecimal literal.

**Example**

```plaintext
data _null_
  length x $32 y $36;
  x='1548611fb8cb6a47a721a6fd284e74f2'x;
  y=put(x, $uuid36.);
  put y;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1548611fb8cb6a47a721a6fd284e74f2</td>
<td>1548611f-b8cb-6a47-a721-a6fd284e74f2</td>
</tr>
</tbody>
</table>
$VARYINGw. Format

Writes character data of varying length.

Valid in: 
DATA step

Category: 
Character

Alignment: 
Left

Restriction: 
This format is not supported in a DATA step that runs in CAS.

Syntax

$VARYINGw. length-variable

Syntax Description

\textit{w}

specifies the maximum width of the output field for any output line or output file record.

\textbf{Default} 
8 if the length of the variable is undefined. Otherwise, the default is the length of the variable

\textbf{Range} 
1–32767

\textit{length-variable}

specifies a numeric variable that contains the length of the current value of the character variable. SAS obtains the value of the \textit{length-variable} by reading it directly from a field that is described in an INPUT statement, reading the value of a variable in an existing SAS data set, or calculating its value.

\textbf{Restriction} 
\textit{length-variable} cannot be an array reference.

\textbf{Requirement} 
You must specify \textit{length-variable} immediately after $VARYINGw. in a SAS statement.

\textbf{Tips}

If the value of \textit{length-variable} is 0, negative, or missing, SAS writes nothing to the output field.

If the value of \textit{length-variable} is greater than 0 but less than \textit{w}, SAS writes the number of characters that are specified by \textit{length-variable}.

If \textit{length-variable} is greater than or equal to \textit{w}, SAS writes \textit{w} columns.

Details

Use $VARYINGw. when the length of a character value differs from record to record. After writing a data value with $VARYINGw., the pointer's position is the first column after the value.
Examples:

Example 1: Obtaining a Variable Length Directly

data one;
  infile datalines truncover;
  input @1 name $12. @14 varlen;
  datalines;
   New York     8
   Toronto      7
   Buenos Aires 12
   Tokyo        5
; run;
proc print;
run;

data _null_
  set one;
  put name $varying12. varlen;
run;

An existing data set variable contains the length of a variable. The data values and the results follow the explanation of this SAS statement:

put @10 name $varying12. varlen;

NAME is a character variable of length 12 that contains values that vary from 1 to 12 characters in length. VARLEN is a numeric variable in the same data set that contains the actual length of NAME for the current observation.

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>New York 8</td>
<td>New York</td>
</tr>
<tr>
<td>Toronto 7</td>
<td>Toronto</td>
</tr>
<tr>
<td>Buenos Aires 12</td>
<td>Buenos Aires</td>
</tr>
<tr>
<td>Tokyo 5</td>
<td>Tokyo</td>
</tr>
</tbody>
</table>

1 The value of NAME appears before the value of VARLEN.

Example 2: Obtaining a Variable Length Indirectly

Use the LENGTH function to determine the length of a variable. The data values and the results follow the explanation of these SAS statements:

varlen=length(name);
put @10 name $varying12. varlen;
The assignment statement determines the length of the varying-length variable. The variable VARLEN contains this length and becomes the length-variable argument to the $VARYING12. format.

<table>
<thead>
<tr>
<th>Value of varlen(^1)</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>New York</td>
<td>New York</td>
</tr>
<tr>
<td>Toronto</td>
<td>Toronto</td>
</tr>
<tr>
<td>Buenos Aires</td>
<td>Buenos Aires</td>
</tr>
<tr>
<td>Tokyo</td>
<td>Tokyo</td>
</tr>
</tbody>
</table>

\(^1\) The value of NAME appears before the value of VARLEN.

\$w. Format

Writes standard character data.

Category: Character  
Alignment: Left  
Alias: $Fw.

Syntax

\$w.

Syntax Description

\(w\) specifies the width of the output field. You can specify a number or a column range.

Default 1, if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

Comparisons

The \$w. format is not identical to the $CHARw. format. The \$w. format trims trailing blanks. The $CHARw. format does not trim trailing blanks.

The \$w. format and the $CHARw. format do not trim leading blanks. To trim leading blanks, use the LEFT function to left-align character data, or use list output with the colon (:) format modifier and the format of your choice.
Example

```sas
data one;
  input name $char5.;
  datalines;
Cary
Tokyo
; run;
data two;
  set one;
  put @name $5.;
  put name $ 10-15;
run;
```

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>#Cary</td>
<td>Cary</td>
</tr>
<tr>
<td>Tokyo</td>
<td>Tokyo</td>
</tr>
</tbody>
</table>

1 The character # represents a blank space.

BESTw. Format

SAS chooses the best notation.

Categories: CAS
Numeric

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

```
BESTw.
```

Syntax Description

*W* specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>1–32</td>
</tr>
</tbody>
</table>
Tip
If you print numbers between 0 and .01 exclusively, use a field width of at least 7 to avoid excessive rounding. If you print numbers between 0 and –.01 exclusively, use a field width of at least 8.

Details
When a format is not specified for writing a numeric value, SAS uses the BESTw. format as the default format. The BESTw. format attempts to write numbers that balance the conflicting requirements of readability, precision, and brevity. Here are several rules:

- Values are written with the maximum readable precision, as determined by the width. The maximum precision for floating-point numbers might be limited to 14 or 15 digits, as determined by the width.
- Integers are written without decimals.
- Numbers with decimals are written with as many digits to the left and right of the decimal point as needed or as allowed by the width.
- Extreme values and values with leading or trailing 0s might be written in scientific notation to fit into the specified width, to increase the precision, or to simplify the magnitude of the number. Extremely small values might be written as 0 if the width is too small for scientific notation.
- Trailing 0s are not written.
- If a value cannot be represented in either decimal or scientific notation in the width that is specified, the output field is filled with asterisks.
- The behavior of the BESTw. format is affected by the setting of the DECIMALCONV option. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference. These rules are generally applicable regardless of the option setting.

Comparisons

- The BESTw. format writes as many significant digits as possible in the output field, but if the numbers vary in magnitude, the decimal points do not line up. Integers are printed without a decimal.
- The Dw.p format writes numbers with the desired precision and more alignment than the BESTw. format.
- The BESTDw.p format is a combination of the BESTw. format and the Dw.p format in that it formats all numeric data, and it does a better job of aligning decimals than the BESTw. format.
- The w.d format aligns decimal points, if possible, but does not necessarily show the same precision for all numbers.

Example

```sas
data one;
x=1257000;
put x best6.;
put x best3.;
run;
```

The following statements produce these results:
<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=1257000; put x best6.;</td>
<td>1.26E6</td>
</tr>
<tr>
<td>x=1257000; put x best3.;</td>
<td>1E6</td>
</tr>
</tbody>
</table>

**See Also**

**Formats:**
- “BESTDw.p Format” on page 137

**BESTDw.p Format**

Prints numeric values, lining up decimal places for values of similar magnitude, and prints integers without decimals.

- **Categories:** CAS, Numeric
- **Alignment:** Right
- **Interaction:** When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Syntax**

```
BESTDw.p
```

**Syntax Description**

- **w**
  - specifies the width of the output field.
  - Default: 12
  - Range: 1–32

- **p**
  - specifies the precision. This argument is optional.
  - Default: 3
  - Range: 0 to w–1
  - Requirement: \( p \) must be less than \( w \).
Tip
If \( p \) is omitted or is specified as 0, then \( p \) is set to 3.

Details
The BESTD\( w.p \) format writes numbers so that the decimal point aligns in groups of values with similar magnitude. Integers are printed without a decimal point. Larger values of \( p \) print the data values with more precision and potentially more shifts in the decimal point alignment. Smaller values of \( p \) print the data values with less precision and a greater chance of decimal point alignment.

The format chooses the number of decimal places to print for ranges of values, even when the underlying values can be represented with fewer decimal places.

Comparisons
- The BEST\( w \) format writes as many significant digits as possible in the output field, but if the numbers vary in magnitude, the decimal points do not line up. Integers are printed without a decimal.
- The Dw\( p \) format writes numbers with the desired precision and more alignment than the BEST\( w \) format.
- The BESTDw\( p \) format is a combination of the BEST\( w \) format and the Dw\( p \) format in that it formats all numeric data, and it does a better job of aligning decimals than the BEST\( w \) format.
- The w.d format aligns decimal points, if possible, but it does not necessarily show the same precision for all numbers.

Example
``` SAS
data one;
  input x;
  datalines;
12345
123.45
1.2345
.12345
;
run;

data _null_; 
  set one;
  put x bestd9.; 
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>

<tr>
<td>12345</td>
<td>12345</td>
</tr>
<tr>
<td>123.45</td>
<td>123.4500</td>
</tr>
<tr>
<td>1.2345</td>
<td>1.2345</td>
</tr>
</tbody>
</table>
See Also

**Formats:**

- “BESTw. Format” on page 135
- “Dw.p Format” on page 158

**BINARYw. Format**

Converts numeric values to binary representation.

<table>
<thead>
<tr>
<th>Category:</th>
<th>Numeric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment:</td>
<td>Left</td>
</tr>
<tr>
<td>Restriction:</td>
<td>This format is not supported in a DATA step that runs in CAS.</td>
</tr>
</tbody>
</table>

**Syntax**

BINARYw.

**Syntax Description**

$w$

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–64</td>
</tr>
</tbody>
</table>

**Comparisons**

BINARYw. converts numeric values to binary representation. The $BINARYw.$ format converts character values to binary representation.

**Example**

```plaintext
data one;
  input x;
  datalines;
123.45
123
-123
;
run;
```
data two;
  set one;
  put x binary8.;
run;

<td>01111011</td>
</tr>
<tr>
<td>-123</td>
<td>10000101</td>
</tr>
</tbody>
</table>

B8601DAw. Format

Writers date values by using the ISO 8601 basic notation yyyyymmdd.

Categories: Date and Time
ISO 8601

Alignment: Left

Restrictions: This format is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.2.1.1, complete representation

Syntax

B8601DAw.

Syntax Description

w
  specifies the width of the output field.
  
  Default 10
  
  Range 8–10

Details

The B8601DA format writes the date value by using the ISO 8601 basic date notation yyyyymmdd:

yyyy
  is a four-digit year.
*mm* is a two-digit month (zero padded) between 01 and 12.

*dd* is a two-digit day of the month (zero padded) between 0 and 31.

**Example**

```latex
data one;
  x='15may2018'd;
  put x b8601da.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>21319</td>
<td>20180515</td>
</tr>
</tbody>
</table>

**See Also**

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

**B8601DNw. Format**

Writers dates from datetime values by using the ISO 8601 basic notation *yyyy-mm-dd*.

*Categories:* Date and Time

*ISO 8601*

*Alignment:* Left

*Restrictions:* This format is not supported in a DATA step that runs in CAS.

UTC time zone offset values are not supported.

*Supports:* ISO 8601 Element 5.2.1.1, complete representation

**Syntax**

`B8601DNw`.

**Syntax Description**

`w` specifies the width of the output field.

*Default:* 10

*Range:* 8–10
Details

The B8601DN format writes the date from a datetime value by using the ISO 8601 basic date notation **yyyy-mm-dd**:

- **yyyy** is a four-digit year.
- **mm** is a two-digit month (zero padded) between 01 and 12.
- **dd** is a two-digit day of the month (zero padded) between 01 and 31.

Example

```
data one;
  x='15may2018:14:52:22'dt;
  put x b8601dn.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>21319</td>
<td>20180515</td>
</tr>
</tbody>
</table>

“Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 43

B8601DTw.d Format

Writes datetime values by using the ISO 8601 basic notation **yyyy-mm-ddThh:mm:ss<ffffff>**.

**Categories:** Date and Time  
ISO 8601

**Alignment:** Left

**Restrictions:** This format is not supported in a DATA step that runs in CAS. UTC time zone offset values are not supported.

**Interaction:** When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Supports:** ISO 8601 Element 5.4.1, complete representation

**Syntax**

```
B8601DTw.d
```
Syntax Description

\texttt{w}
\begin{itemize}
  \item specifies the width of the output field.
  \begin{itemize}
    \item Default: 19
    \item Range: 15–26
  \end{itemize}
\end{itemize}

\texttt{d}
\begin{itemize}
  \item specifies the number of digits to the right of the seconds value that represents a fraction of a second. This argument is optional.
  \begin{itemize}
    \item Default: 0
    \item Range: 0–6
  \end{itemize}
\end{itemize}

Details

The B8601DT format writes the datetime value by using the ISO 8601 basic datetime notation \texttt{yyyyMMddThhmmss<ffffff>}:

- \texttt{yyyy}
  - is a four-digit year.

- \texttt{mm}
  - is a two-digit month (zero padded) between 01 and 12.

- \texttt{dd}
  - is a two-digit day of the month (zero padded) between 01 and 31.

- \texttt{hh}
  - is a two-digit hour (zero padded) between 00 and 23.

- \texttt{mm}
  - is a two-digit minute (zero padded) between 00 and 59.

- \texttt{ss}
  - is a two-digit second (zero padded) between 00 and 59.

- \texttt{ffffff}
  - are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

Example

\begin{verbatim}
data one;
  x='15may2018:14:52:22'dt;
  put x b8601dt.;
run;
\end{verbatim}

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1842015142</td>
<td>20180515T145222</td>
</tr>
</tbody>
</table>
B8601DXw. Format

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone basic notation $yyyyymmddThh:mm:ss+hh:mm$.

Categories: Date and Time
ISO 8601

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.

Supports: ISO 8601 Element 5.4.1, complete representation

Syntax

B8601DXw.

Syntax Description

$w$

specifies the width of the output field.

Default 26

Range 20–35

Details

UTC values specify a date and a time that are based on the zero meridian in Greenwich, England. Using this format, SAS converts a datetime value to the UTC value and determines the user local date and time by using the value of the TIMEOUTE= system option. If the TIMEOUTE= option is not set, then the user local date and time are based on the local date and time. The B8601DX format writes SAS datetime values by using the following ISO 8601 basic datetime notation:

$yyyyymmddThh:mm:ss+hh:mm$

$yyyy$

is a four-digit year.

$mm$

is a two-digit month (zero padded) between 01 and 12.

$dd$

is a two-digit day of the month (zero padded) between 01 and 31.

$hh$

is a two-digit hour (zero padded) between 00 and 23.
**B8601DZw. Format**

Writes datetime values for the zero meridian Coordinated Universal Time (UTC) time by using the ISO 8601 datetime and time zone basic notation `yyyymmddThhmmss±0000`.

- **Categories:** Date and Time
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.
- **Supports:** ISO 8601 Element 5.4.1, complete representation
Syntax

**B8601DZw.**

Syntax Description

`w` specifies the width of the output field.

**Default:** 26

**Range:** 20–35

Details

UTC values specify a time and a time zone based on the zero meridian in Greenwich, England. The B8601DZ format writes SAS datetime values for the zero meridian date and time by using one of these ISO 8601 basic datetime notations:

- `yyyymmddThhmmss+0000`
  
  **Note:** Use this form when `w` is large enough to support this time zone notation.

- `yyyymmddThhmmssZ`
  
  **Note:** Use this form when `w` is not large enough to support the `+0000` time zone notation.

`yyyy` is a four-digit year.

`mm` is a two-digit month (zero padded) between 01 and 12.

`dd` is a two-digit day of the month (zero padded) between 01 and 31.

`hh` is a two-digit hour (zero padded) between 00 and 23.

`mm` is a two-digit minute (zero padded) between 00 and 59.

`ss` is a two-digit second (zero padded) between 00 and 59.

`+0000` indicates the UTC time for the zero meridian (Greenwich, England).

An ISO 8601 time or datetime value that specifies a time zone offset is adjusted by the number of hours and minutes that is specified in the offset. Then, the time zone offset is processed as the time or datetime for the zero meridian (Greenwich, England). The B8601DZ format always writes the datetime value by using the zero meridian offset value of +0000. To write a datetime that uses a time zone offset other than +0000, see “B8601LZw. Format” on page 148.

**Restriction:** The shorter form +00 is not supported.
Z indicates that the time is for the zero meridian (Greenwich, England) or +0000 UTC time. Z is used when the width of the format does not support the +0000 notation.

Example

data _null_;    
  offset_added=input('20180601T123456+0500',b8601dz.);  
  nooffset=input('20180601T123456Z',b8601dz.);  
  put offset_added b8601dz.;  
  put nooffset b8601dz.;  
run;

20180601T073456+0000  
20180601T123456+0000

See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

B8601LXw. Format

Writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 basic notation yyyymmdThhmmss+[−]hhmm.

Categories: Date and Time
ISO 8601

Alignment: Right

Restriction: This format is not supported in a DATA step that runs in CAS.

Supports: ISO 8601 Elements 5.3.3 and 5.3.4.2

Syntax

B8601LXw

Syntax Description

w specifies the width of the output field.

Default 26

Range 20–35
Details

The B8601LX format writes datetime values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using the ISO 8601 basic datetime notation:

- \( yyyyymmddThhmmss+|–hhmm \)

- \( yyyy \)
  - is a four-digit year.

- \( mm \)
  - is a two-digit month (zero padded) between 01 and 12.

- \( dd \)
  - is a two-digit day of the month (zero padded) between 01 and 31.

- \( hh \)
  - is a two-digit hour (zero padded) between 00 and 23.

- \( mm \)
  - is a two-digit minute (zero padded) between 00 and 59.

- \( ss \)
  - is a two-digit second (zero padded) between 00 and 59.

- \( +|–hhmm \)
  - is an hour and minute signed offset from zero meridian time. The offset must be \( +|–hhmm \) (that is, + or – and four characters).

  Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

  **Restriction:** The shorter form \( +|–hh \) is not supported.

Example

This PUT statement writes the time for the Eastern Standard time zone:

\[
\text{blx} = '01Feb2013T12:34:56'dt; \\
\text{put blx b8601lx.};
\]

<table>
<thead>
<tr>
<th>Value of blx</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1675341296</td>
<td>20130201T123456-0500</td>
</tr>
</tbody>
</table>

See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

B8601LZw. Format

Writes time values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 basic time notation \( hhmmss+|–hhmm \).
Syntax

**B8601LZ**\(w\).

Syntax Description

\(w\)

specifies the width of the output field.

- **Default**: 14
- **Range**: 9–20

Details

The B8601LZ format writes time values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using the ISO 8601 basic notation \(hhmmss\)+\(–\)\(hhmm\):

- \(hh\) is a two-digit hour (zero padded) between 00 and 23.
- \(mm\) is a two-digit minute (zero padded) between 00 and 59.
- \(ss\) is a two-digit second (zero padded) between 00 and 59.
- \(+\)\(–\)\(hhmm\) is an hour and minute signed offset from zero meridian time. Note that the offset must be \(+\)\(–\)\(hhmm\) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, \(+0200\) indicates a two-hour time difference to the east of the zero meridian, and \(–0600\) indicates a six-hour time difference to the west of the zero meridian.

**Restriction**: The shorter form \(+\)\(–\)\(hh\) is not supported.

When SAS reads a UTC time by using the B8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 000000 and 235959. If the B8601LZ format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

Example

```sas
data one;
x='15:32';
put x b8601lz;
```
This PUT statement writes the time for the Eastern Standard time zone:

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>21319</td>
<td>153200-0400</td>
</tr>
</tbody>
</table>

See Also

“Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 43

B8601TMw.d Format

Writes time values by using the ISO 8601 basic notation $hhmmss<ffff>$.

Categories: Date and Time
ISO 8601

Alignment: Left

Restrictions: This format is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Supports: ISO 8601 Element 5.3.1.1, complete representation

Syntax

B8601TMw.d

Syntax Description

$w$

specifies the width of the output field.

Default 8
Range 6–15

$\text{d}$

specifies the number of digits to the right of the seconds value that represents a fraction of a second. This argument is optional.

Default 0
Range 0–6
Details

The B8601TM format writes SAS time values by using the ISO 8601 basic time notation $\text{hhmmss}<ffffff>$:

$\text{hh}$
- is a two-digit hour (zero padded) between 00 and 23.

$\text{mm}$
- is a two-digit minute (zero padded) between 00 and 59.

$\text{ss}$
- is a two-digit second (zero padded) between 00 and 59.

$ffffff$
- are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

Example

data one;
  x='15:32't;
  put x b8601tm.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

B8601TXw. Format

Adjusts a Coordinated Universal Time (UTC) value to the user’s local time. Then, writes the local time by using the ISO 8601 basic time notation $\text{hhmmss+|-hhmm}$.

Categories: Date and Time
ISO 8601

Alignment: Right

Restriction: This format is not supported in a DATA step that runs in CAS.

Supports: ISO 8601 Elements 5.3.3 and 5.3.4

Syntax

B8601TXw.
Syntax Description

\( w \)

specifies the width of the output field.

**Default**: 14

**Range**: 9–20

**Details**

UTC values specify a time based on the zero meridian in Greenwich, England. Using this format, SAS converts a time value to the UTC value and determines the user local time by using the `TIMEZONE=` system option. If the `TIMEZONE=` option is not set, then the user local time is based on the local time. The B8601TX format writes SAS datetime values by using the following ISO 8601 basic time notation:

- \( hhmmss+|–hhmm \)
- \( hh \) is a two-digit hour (zero padded) between 00 and 23.
- \( mm \) is a two-digit minute (zero padded) between 00 and 59.
- \( ss \) is a two-digit second (zero padded) between 00 and 59.
- \( +|–hhmm \) is an hour and minute signed offset from zero meridian time. The offset must be \( +|–hhmm \) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

**Restriction**: The shorter form \( +|–hh \) is not supported.

When SAS reads a UTC time by using the B8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 000000 and 240000. If the B8601TX format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

**Example**

The first example uses the local time to determine the time and the time zone offset. The second example changes the time zone to America/Adak, which is Hawaii-Aleutian Time.

<table>

run;

**See Also**

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

---

**B8601TZw. Format**

Adjusts time values to the Coordinated Universal Time (UTC) and writes the time values by using the ISO 8601 basic time notation `hhmmsst–hhmm`.

**Categories:** Date and Time

**ISO 8601**

**Alignment:** Left

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Supports:** ISO 8601 Elements 5.3.3 and 5.3.4

**Syntax**

`B8601TZw.`

**Syntax Description**

`w`

-specifies the width of the output field.

**Default** 14

**Range** 9–20

**Details**

UTC time values specify a time and a time zone based on the zero meridian in Greenwich, England. The B8601TZ format adjusts the time value to be the time at the zero meridian and writes the time value in one of these ISO 8601 basic time notations:

- `hhmmsst–hhmm`

**Note:** Use this form when `w` is large enough to support this time notation.
**hhmmssZ**

Note: Use this form when *w* is not large enough to support the +|−*hhmm* time zone notation.

*hh*

is a two-digit hour (zero padded) between 00 and 23.

*mm*

is a two-digit minute (zero padded) between 00 and 59.

*ss*

is a two-digit second (zero padded) between 00 and 59.

+|−*hh:mm*

is an hour and minute signed offset from zero meridian time. Note that the offset must be +|−*hhmm* (that is, + or − and four characters).

Use + for time zones east of the zero meridian, and use − for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and −0600 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form +|−*hh* is not supported.

*Z*

indicates that the time is for zero meridian (Greenwich, England) or +0000 UTC time.

When SAS reads a UTC time by using the B8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 000000 and 240000. If the B8601TZ format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

**Comparisons**

For time values between 000000 and 240000, the B8601TZ format adjusts the time value to be the time at the zero meridian and writes the time value in the international standard extended time notation. The B8601LZ format makes no adjustment to the time and writes time values in the international standard extended time notation, using a UTC time zone offset for the local SAS session.

**Example**

```
data one;
  x='15:32't;
  put x b8601tz.;
run;
```

<table>
<thead>
<tr>
<th>Value for x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>55920</td>
<td>153200+0000</td>
</tr>
</tbody>
</table>
COMMAw.d Format

 Writes numeric values with a comma that separates every three digits and a period that separates the decimal fraction.

 **Syntax**

 `COMMAw.d`

 **Syntax Description**

 - **w**
   - Specifies the width of the output field.
   - Default: 6
   - Range: 1–32
   - Tip: Make `w` wide enough to write the numeric values, the commas, and the optional decimal point.

 - **d**
   - Specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.
   - Range: 0–31
   - Requirement: `d` must be less than `w`

 **Details**

 The COMMAw.d format writes numeric values with a comma that separates every three digits and a period that separates the decimal fraction.

 **Comparisons**

 - The COMMAw.d format is similar to the COMMAXw.d format, but the COMMAXw.d format reverses the roles of the decimal point and the comma. This convention is common in European countries.
The COMMAw.d format is similar to the DOLLARw.d format except that the COMMAw.d format does not print a leading dollar sign.

Example

```sas
data one;
  input x;
  datalines;
23451.23
123451.234
;
run;

data two;
  set one;
  put x comma10.2;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>23451.23</td>
<td>23,451.23</td>
</tr>
<tr>
<td>123451.234</td>
<td>123,451.23</td>
</tr>
</tbody>
</table>

- "DOLLARw.d Format" on page 170

COMMAXw.d Format

Writes numeric values with a period that separates every three digits and a comma that separates the decimal fraction.

Categories: CAS
Numeric

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.
Syntax

**COMMAX\(w.d\)**

Syntax Description

\(w\)

specifies the width of the output field. This argument is optional.

- **Default:** 6
- **Range:** 1–32
- **Tip:** Make \(w\) wide enough to write the numeric values, the commas, and the optional decimal point.

\(d\)

specifies the number of digits to the right of the decimal point in the numeric value.

- **Range:** 0–31
- **Requirement:** must be less than \(w\)

Details

The COMMAX\(w.d\) format writes numeric values with a period that separates every three digits and with a comma that separates the decimal fraction.

Comparisons

The COMMA\(w.d\) format is similar to the COMMAX\(w.d\) format, but the COMMAX\(w.d\) format reverses the roles of the decimal point and the comma. This convention is common in European countries.

Example

data one;
  input x;
  datalines;
  23451.23
  123451.234
  ;
  run;

data two;
  set one;
  put x commax10.2;
  run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>23451.23</td>
<td>123451.234</td>
</tr>
</tbody>
</table>

---

1
---
Dw.p Format

Prints numeric values, possibly with a great range of values, lining up decimal places for values of similar magnitude.

**Categories:**
- CAS
- Numeric

**Alignment:**
- Right

**Interaction:**
When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

### Syntax

`Dw.p`

### Syntax Description

**w**

specifies the width of the output field. This argument is optional.

- **Default:** 12
- **Range:** 1–32

**p**

specifies the precision. This argument is optional.

- **Default:** 3
- **Range:** 0–16
- **Requirement:** `p` must be less than `w`
- **Tips:** If `p` is omitted or is specified as 0, then `p` is set to 3.
  If zero is the desired precision, use the `w.d` format in place of the `Dw.p` format.

### Details

The `Dw.p` format writes numbers so that the decimal point aligns in groups of values with similar magnitude. Larger values of `p` print the data values with more precision.
and potentially more shifts in the decimal point alignment. Smaller values of $p$ print the data values with less precision and a greater chance of decimal point alignment.

Comparisons

- The BESTw. format writes as many significant digits as possible in the output field, but if the numbers vary in magnitude, the decimal points do not line up.
- Dw.p writes numbers with the desired precision and more alignment than the BESTw. format.
- The BESTDw.p format is a combination of the BESTw. format and the Dw.p format in that it formats all numeric data, and it does a better job of aligning decimals than the BESTw. format.
- The $w.d$ format aligns decimal points, if possible, but it does not necessarily show the same precision for all numbers.

Example

```plaintext
data one;
  input x;
  datalines;
  12345
  1234.5
  123.45
  12.345
  1.2345
  .12345
;
run;

data two;
  set one;
  put x d10.4;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>12345</td>
<td>12345.0</td>
</tr>
<tr>
<td>1234.5</td>
<td>1234.5</td>
</tr>
<tr>
<td>123.45</td>
<td>123.45000</td>
</tr>
<tr>
<td>12.345</td>
<td>12.34500</td>
</tr>
<tr>
<td>1.2345</td>
<td>1.23450</td>
</tr>
<tr>
<td>.12345</td>
<td>0.12345</td>
</tr>
</tbody>
</table>

---

**DATEw. Format**

Writes date values in the form *ddmmmyy, ddmmmyyyy, or dd-mmm-yyyy*.

**Syntax**

**DATEw.**

**Syntax Description**

w

specifies the width of the output field.

- **Default**: 7
- **Range**: 5–11
- **Tip**: Use a width of 9 to print a four-digit year without a separator between the day, month, and year. Use a width of 11 to print a four-digit year using a hyphen as a separator between the day, month, and year.

**Details**

The DATEw. format writes SAS date values in the form *ddmmmyy, ddmmmyyyy, or dd-mmm-yyyy*.

*dd*  
is an integer that represents the day of the month.

*mmm*  
is the first three letters of the month name.

*yy* or *yyyy*

is a two-digit or four-digit integer that represents the year.

**Example**

data one;
/* create SAS date with date literal */
x='15mar2018'd;
put x date5.;
put x date6.;
The example table uses the input value of 21258, which is the SAS date value that corresponds to March 15, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x date5.;</td>
<td>15MAR</td>
</tr>
<tr>
<td>put x date6.;</td>
<td>15MAR</td>
</tr>
<tr>
<td>put x date7.;</td>
<td>15MAR18</td>
</tr>
<tr>
<td>put x date8.;</td>
<td>15MAR18</td>
</tr>
<tr>
<td>put x date9.;</td>
<td>15MAR2018</td>
</tr>
<tr>
<td>put x date11.;</td>
<td>15-MAR-2018</td>
</tr>
</tbody>
</table>

**Informat:**
- “DATEw. Informat” on page 559

---

**DATEAMPMw.d Format**

Writes datetime values in the form `ddmmmyy:hh:mm:ss.ss` with AM or PM.

**Categories:** CAS

**Date and Time**

**Alignment:** Right

**Interaction:** When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in *SAS System Options: Reference.*

**Syntax**

`DATEAMPMw.d`
Syntax Description

\( w \)

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>19</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>7–40</td>
</tr>
</tbody>
</table>

Tip: SAS requires a minimum \( w \) value of 13 to write AM or PM. For widths between 10 and 12, SAS writes a 24-hour clock time.

\( d \)

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

<table>
<thead>
<tr>
<th>Range</th>
<th>0–39</th>
</tr>
</thead>
</table>

Requirement: \( d \) must be less than \( w \).

Note: If \( w-d<17 \), SAS truncates the decimal values.

Details

The DATEAMPM\( w.d \) format writes SAS datetime values in the form \( ddmmyy:hh:mm:ss.ss \).

\( dd \)

is an integer that represents the day of the month.

\( mmm \)

is the first three letters of the month name.

\( yy \)

is a two-digit integer that represents the year.

\( hh \)

is an integer that represents the hour.

\( mm \)

is an integer that represents the minutes.

\( ss.ss \)

is the number of seconds to two decimal places.

Comparisons

The DATEAMPM\( w.d \) format is similar to the DATETIME\( w.d \) format, except that DATEAMPM\( w.d \) prints AM or PM at the end of the time.

Example

```sas
data one;
  x='14mar2018:-1:34:27'dt;
  put x dateampm.;
  put x dateampm7.;
  put x dateampm10.;
  put x dateampm13.;
  put x dateampm22.2;
```
run;

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x dateampm.;</td>
<td>13MAR18:10:25:33 PM</td>
</tr>
<tr>
<td>put x dateampm7.;</td>
<td>13MAR18</td>
</tr>
<tr>
<td>put x dateampm10.;</td>
<td>13MAR18:22</td>
</tr>
<tr>
<td>put x dateampm13.;</td>
<td>13MAR18:10 PM</td>
</tr>
<tr>
<td>put x dateampm22.2;</td>
<td>13MAR18:10:25:33.00 PM</td>
</tr>
</tbody>
</table>

**Formats:**

- "DATETIMEw.d Format" on page 163

---

**DATETIMEw.d Format**

Writers datetime values in the form `ddmmyy:hh:mm:ss.ss`.

**Categories:** CAS

**Date and Time**

**Alignment:** Right

**Restriction:** If `w–d< 17`, SAS truncates the decimal values.

**Interaction:** When the `DECIMALCONV=` system option is set to `STDIEEE`, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Syntax**

**DATETIMEw.d**

**Syntax Description**

**w**

specifies the width of the output field.

**Default** 16

**Range** 7–40
Tip

SAS requires a minimum \( w \) value of 16 to write a SAS datetime value with the date, hour, and seconds. Add an additional two places to \( w \) and a value to \( d \) to return values with optional decimal fractions of seconds.

\( d \)

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Range

0–39

Requirement

\( d \) must be less than \( w \).

Details

The DATETIME\( w.d \) format writes SAS datetime values in the form \( \text{ddmmmyy}:hh:mm:ss.ss \).

\( \text{dd} \)

is an integer that represents the day of the month.

\( \text{mmm} \)

is the first three letters of the month name.

\( \text{yy} \)

is a two-digit integer that represents the year.

\( \text{hh} \)

is an integer that represents the hour in 24-hour clock time.

\( \text{mm} \)

is an integer that represents the minutes.

\( \text{ss.ss} \)

is the number of seconds to two decimal places.

Example

```sas
data one;
x='15mar2018:-1:34:27'dt;
put x datetime.;
put x datetime7.;
put x datetime12.;
put x datetime18.;
put x datetime18.1;
put x datetime19.;
put x datetime20.1;
put x datetime21.2;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x datetime.;</td>
<td>14MAR18:22:25:33</td>
</tr>
<tr>
<td>put x datetime7.;</td>
<td>14MAR18</td>
</tr>
<tr>
<td>SAS Statement</td>
<td>Result</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>put x datetime12.;</td>
<td>14MAR18:22</td>
</tr>
<tr>
<td>put x datetime18.;</td>
<td>14MAR18:22:25:33</td>
</tr>
<tr>
<td>put x datetime18.1;</td>
<td>14MAR18:22:25:33.0</td>
</tr>
<tr>
<td>put x datetime19.;</td>
<td>14MAR2018:22:25:33</td>
</tr>
<tr>
<td>put x datetime20.1;</td>
<td>14MAR2018:22:25:33.0</td>
</tr>
<tr>
<td>put x datetime21.2;</td>
<td>14MAR2018:22:25:33.00</td>
</tr>
</tbody>
</table>

**DAYw. Format**

Writes date values as the day of the month.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Right

**Syntax**

```
DAYw.
```

**Syntax Description**

`w`

specifies the width of the output field.
DDMMYYw. Format

Writes date values in the form \texttt{ddmm<yy>yy} or \texttt{dd/mm<yy>yy}, where a forward slash is the separator and the year appears as either two or four digits.

**Categories:** CAS  
Date and Time

**Alignment:** Right

**Syntax**

\texttt{DDMMYYw}.

**Syntax Description**

\textit{w} specifies the width of the output field.

**Default** 8

**Range** 2–10

**Interaction** When \textit{w} has a value from 2 to 5, the date appears with as much of the day and the month as possible. When \textit{w} is 7, the date appears as a two-digit year without slashes.

**Details**

The DDMMYYw. format writes SAS date values in the form \texttt{ddmm<yy>yy} or \texttt{dd/mm<yy>yy}.
*dd*  
is an integer that represents the day of the month.

* /  
is the separator.

*mm*  
is an integer that represents the month.

<yy>yy  
is a two-digit or four-digit integer that represents the year.

### Example

```sas
data one;
  x='15may2018'd;
  put x ddmmyy5.;
  put x ddmmyy6.;
  put x ddmmyy7.;
  put x ddmmyy8.;
  put x ddmmyy10.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x ddmmyy5.;</td>
<td>15/05</td>
</tr>
<tr>
<td>put x ddmmyy6.;</td>
<td>150518</td>
</tr>
<tr>
<td>put x ddmmyy7.;</td>
<td>150518</td>
</tr>
<tr>
<td>put x ddmmyy8.;</td>
<td>15/05/18</td>
</tr>
<tr>
<td>put x ddmmyy10.;</td>
<td>15/05/2018</td>
</tr>
</tbody>
</table>

DDMMYYxw. Format

Writes date values in the form \textit{ddmm\textless yy\textgreater yy} or \textit{dd-mm-yy\textless yy\textgreater}, where the \textit{x} in the format name is a character that represents the special character that separates the day, month, and year. The special character can be a blank character, colon (\textbf{:}), hyphen (\textbf{-}), no separator, period (\textbf{.}), or slash (\textbf{/}). The year can be either two or four digits.

Categories: CAS
Date and Time

Alignment: Right

Syntax

\textbf{DDMMYYxw.}

Syntax Description

\textit{x} identifies a separator or specifies that no separator appear between the day, the month, and the year. The following values are valid for \textit{x}:

- \textbf{B} separates with a blank
- \textbf{C} separates with a colon
- \textbf{D} separates with a hyphen
- \textbf{N} indicates no separator
- \textbf{P} separates with a period
- \textbf{S} separates with a slash

\textit{w} specifies the width of the output field.

\begin{tabular}{|l|}
\hline
Default & 8 \\
\hline
Range & 2–10 \\
\hline
Interactions & When \textit{w} has a value of 2 to 5, the date appears with as much of the day and the month as possible. When \textit{w} is 7, the date appears as a two-digit year without separators. \\
\hline
\end{tabular}
When \( x \) has a value of N, the width range changes from 2 to 8.

**Details**

The DDMMYY\( x \)w. format writes SAS date values in the form \( ddm\textless yy\textgreater yy \) or \( ddxymm\textless yy\textgreater yy \):

- \( dd \) is an integer that represents the day of the month.
- \( x \) is a specified separator.
- \( mm \) is an integer that represents the month.
- \( \textless yy\textgreater yy \) is a two-digit or four-digit integer that represents the year.

**Example**

```sas
data one;
  x='15jun2018'd;
  put x ddmmyyc5.;
  put x ddmmyyd8.;
  put x ddmmyyp10.;
  put x ddmmyyn8.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x ddmmyyc5. ;</td>
<td>15:06</td>
</tr>
<tr>
<td>put x ddmmyyd8. ;</td>
<td>15-06-18</td>
</tr>
<tr>
<td>put x ddmmyyp10. ;</td>
<td>15.06.2018</td>
</tr>
<tr>
<td>put x ddmmyyn8. ;</td>
<td>15062018</td>
</tr>
</tbody>
</table>

**DOLLARw.d Format**

Writes numeric values with a leading dollar sign, a comma that separates every three digits, and a period that separates the decimal fraction.

**Categories:**
- CAS
- Numeric

**Alignment:**
- Right

**Interaction:**
When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Syntax**
```
DOLLARw.d
```

**Syntax Description**

- **w**
  - specifies the width of the output field.
  - Default: 6
  - Range: 2–32

- **d**
  - specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.
  - Range: 0–31
  - Requirement: must be less than **w**

**Details**

The DOLLARw.d format writes numeric values with a leading dollar sign, a comma that separates every three digits, and a period that separates the decimal fraction.

The hexadecimal representation of the code for the dollar sign character ($) is 5B on EBCDIC systems and 24 on ASCII systems. The monetary character that these codes represent might be different in other countries, but DOLLARw.d always
produces one of these codes. If you need another monetary character, define your own format with the FORMAT procedure. For more information, see “FORMAT Procedure” in Base SAS Procedures Guide.

Comparisons

- The DOLLARw.d format is similar to the DOLLARXw.d format, but the DOLLARXw.d format reverses the roles of the decimal point and the comma. This convention is common in European countries.
- The DOLLARw.d format is the same as the COMMAw.d format except that the COMMAw.d format does not write a leading dollar sign.

Example

```
data one;
  netpay=1254.71;
  put netpay dollar10.2;
run;
```

<table>
<thead>
<tr>
<th>Value of netpay</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1254.71</td>
<td>$1,254.71</td>
</tr>
</tbody>
</table>

DOLLARXw.d Format

Writes numeric values with a leading dollar sign, a period that separates every three digits, and a comma that separates the decimal fraction.

Categories: CAS

Numeric

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

DOLLARXw.d
Syntax Description

w
specifies the width of the output field.

Default: 6
Range: 2–32

d
specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Default: 0
Range: 0–31

Requirement: d must be less than w.

Details

The DOLLARXw.d format writes numeric values with a leading dollar sign, with a period that separates every three digits, and with a comma that separates the decimal fraction.

The hexadecimal representation of the code for the dollar sign character ($) is 5B on EBCDIC systems and 24 on ASCII systems. The monetary character that these codes represent might be different in other countries, but DOLLARXw.d always produces one of these codes. If you need another monetary character, define your own format with the FORMAT procedure. For more information, see “FORMAT Procedure” in Base SAS Procedures Guide.

Comparisons

- The DOLLARXw.d format is similar to the DOLLARw.d format, but the DOLLARXw.d format reverses the roles of the decimal point and the comma. This convention is common in European countries.
- The DOLLARXw.d format is the same as the COMMAXw.d format, except that the COMMAXw.d format does not write a leading dollar sign.

Example

```sas
data one;
  netpay=1254.71;
  put netpay dollarx10.2;
run;
```

<table>
<thead>
<tr>
<th>Value of netpay</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1254.71</td>
<td>$1,254.71</td>
</tr>
</tbody>
</table>
See Also

Formats:
- “COMMAXw.d Format” on page 156
- “DOLLARw.d Format” on page 170

DOWNAMEw. Format

Writes date values as the name of the day of the week.

Categories: CAS
Date and Time

Alignment: Right

Syntax

DOWNAMEw.

Syntax Description

w
specifies the width of the output field.

Default 9

Range 1–32

Tip If you omit w, SAS prints the entire name of the day.

Details

If necessary, SAS truncates the name of the day to fit the format width. For example, the DOWNAME2. format prints the first two letters of the day name.

Example

```sas
data one;
  mydate='28MAR2018'd;
  put mydate downame.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate downame.;</td>
<td>Wednesday</td>
</tr>
</tbody>
</table>
DTDATEw. Format

DTDATEw. Format writes SAS date values in the form \textit{ddmmyy} or \textit{ddmmyyyy}. Examples of the format are \textit{01Jan84} and \textit{01Jan1984}. This format is not supported in a DATA step that runs in CAS.

Syntax

\textbf{Syntax Description}

\textbf{w} specifies the width of the output field.

\begin{itemize}
  \item \textbf{Default} 7
  \item \textbf{Range} 5–9
  \item \textbf{Tip} Use a width of 9 to print a four-digit year.
\end{itemize}

Details

The DTDATEw. format writes SAS date values in the form \textit{ddmmyy} or \textit{ddmmyyyy}:

\begin{itemize}
  \item \textit{dd} is an integer that represents the day of the month.
  \item \textit{mmm} is the first three letters of the month name.
  \item \textit{yy} or \textit{yyyy} is a two-digit or four-digit integer that represents the year.
\end{itemize}

Comparisons

The DTDATEw. format produces the same type of output that the DATEw. format produces. The difference is that the DTDATEw. format requires a datetime value.

Example

```
data one;
```
mydt='28mar2018 13:45:14'dt;
put mydt dtdate.;
put mydt dtdate9.;
run;

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydt dtdate.</td>
<td>28MAR18</td>
</tr>
<tr>
<td>put mydt dtdate9.</td>
<td>28MAR2018</td>
</tr>
</tbody>
</table>

**Formats:**

- "DATEw. Format" on page 160

---

**DTMONYYw. Format**

Writes the date part of a datetime value as the month and year in the form `mmmyy` or `mmmyyyy`.

**Categories:**

- CAS
- Date and Time

**Alignment:**

- Right

**Syntax**

`DTMONYYw`.

**Syntax Description**

- `w` specifies the width of the output field.
  - Default: 5
  - Range: 5–7

**Details**

The `DTMONYYw` format writes SAS datetime values in the form `mmmyy` or `mmmyyyy`:

- `mmm` is the first three letters of the month name.
yy or yyyy

is a two-digit or four-digit integer that represents the year.

Comparisons

The DTMONYYw. format and the MONYYw. format are similar in that they both write date values. The difference is that DTMONYYw. expects a datetime value as input, and MONYYw. expects a SAS date value.

Example

data one;
  mydt='28mar2018 13:45:14'dt;
  put mydt dtmonyy.;
  put mydt dtmonyy5.;
  put mydt dtmonyy6.;
  put mydt dtmonyy7.;
run;

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydt dtmonyy.;</td>
<td>MAR18</td>
</tr>
<tr>
<td>put mydt dtmonyy5.;</td>
<td>MAR18</td>
</tr>
<tr>
<td>put mydt dtmonyy6.;</td>
<td>MAR18</td>
</tr>
<tr>
<td>put mydt dtmonyy7.;</td>
<td>MAR2018</td>
</tr>
</tbody>
</table>

See Also

Formats:
- “DATETIMEw.d Format” on page 163
- “MONYYw. Format” on page 230

DTWKDATXw. Format

Writes the date part of a datetime value as the day of the week and the date in the form day-of-week, dd month-name yy (or yyyy).
Syntax

**DTWKDATX\text{w.}**

Syntax Description

\textit{w}

specifies the width of the output field.

**Default** 29

**Range** 3–37

Details

The DTWKDATX\text{w.} format writes SAS date values in the form \textit{day-of-week, dd month-name, yy or yyyy.}

\textit{day-of-week}

is either the first three letters of the day name or the entire day name.

\textit{dd}

is an integer that represents the day of the month.

\textit{month-name}

is either the first three letters of the month name or the entire month name.

\textit{yy} or \textit{yyyy}

is a two-digit or four-digit integer that represents the year.

Comparisons

The DTWKDATX\text{w.} format is similar to the WEEKDATX\text{w.} format in that they both write date values. The difference is that DTWKDATX\text{w.} expects a datetime value as input, and WEEKDATX\text{w.} expects a SAS date value.

Example

```sas
data one;
  mydt='28mar2018 13:45:14'dt;
  put mydt dtwkdatx.;
  put mydt dtwkdatx3.;
  put mydt dtwkdatx8.;
  put mydt dtwkdatx25.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydt dtwkdatx.;</td>
<td>Wednesday, 28 March 2018</td>
</tr>
<tr>
<td>put mydt dtwkdatx3.;</td>
<td>Wed</td>
</tr>
<tr>
<td>put mydt dtwkdatx8.;</td>
<td>Wed</td>
</tr>
</tbody>
</table>
DTYEARw. Format

Writes the date part of a datetime value as the year in the form yy or yyyy.

Syntax

DTYEAR\textit{w}.

Syntax Description

\textit{w} specifies the width of the output field.

- Default: 4
- Range: 2–4

Details

The DTYEAR\textit{w}. format is similar to the YEAR\textit{w}. format in that they both write date values. The difference is that DTYEAR\textit{w}. expects a datetime value as input, and YEAR\textit{w}. expects a SAS date value.

Example

```sas
data one;
  mydt='28mar2018 13:45:14'dt;
  put mydt dtyear.;
  put mydt dtyear2.;
  put mydt dtyear3.;
  put mydt dtyear4.;
run;
```
### DTYYQCw. Format

Writes the date part of a datetime value as the year and the quarter and separates them with a colon (:).

**Categories:** CAS

**Date and Time**

**Alignment:** Right

#### Syntax

**DTYYQCw.**

#### Syntax Description

- **w**
  - specifies the width of the output field.

  **Default:** 4
  
  **Range:** 4–6

#### Details

The DTYYQCw. format writes SAS datetime values in the form *yy* or *yyyy*, followed by a colon (:) and the numeric value for the quarter of the year.
Example

data one;
  mydt='28mar2018 13:45:14'dt;
  put mydt dtyyqc.;
  put mydt dtyyqc4.;
  put mydt dtyyqc5.;
  put mydt dtyyqc6.;
run;

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydt dtyyqc.;</td>
<td>18:1</td>
</tr>
<tr>
<td>put mydt dtyyqc4.;</td>
<td>18:1</td>
</tr>
<tr>
<td>put mydt dtyyqc5.;</td>
<td>18:1</td>
</tr>
<tr>
<td>put mydt dtyyqc6.;</td>
<td>2018:1</td>
</tr>
</tbody>
</table>

Formats:
- "DATETIMEw.d Format" on page 163

Ew. Format

Writes numeric values in scientific notation.

Categories: CAS
            Numeric

Alignment: Right

Syntax

Ew.

Syntax Description

w
  specifies the width of the output field. The output field can display up to 14 significant digits.

Default: 12
Range: 7–32
Details

When formatting values in scientific notation, the E format reserves the first column of the result for a minus sign and formats up to 14 significant digits.

Example

```sas
data one;
  input value;
datalines;
  1257
  -1257
;
run;

data two;
  set one;
  put value e10.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-------+enie-+1</td>
</tr>
<tr>
<td>1257</td>
<td>1.257E+03</td>
</tr>
<tr>
<td>-1257</td>
<td>-1.257E+03</td>
</tr>
</tbody>
</table>

E8601DAw. Format

Writes date values by using the ISO 8601 extended notation yyyy-mm-dd.

Categories: CAS
            Date and Time
            ISO 8601

Alignment: Left

Alias: IS8601DAw.

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.2.1.1, complete representation

Syntax

E8601DAw.
Syntax Description

**w**

specifies the width of the output field.

Default 10

Requirement The width of the output field must be 10.

Details

The E8601DA format writes a date by using the ISO 8601 extended notation `yyyy-mm-dd`:

`yyyy`

is a four-digit year.

`mm`

is a two-digit month (zero padded) between 01 and 12.

`dd`

is a two-digit day of the month (zero padded) between 01 and 31.

Example

```sas
data one;
  mydt='15sep2018'd;
  put mydt e8601da.;
run;
```

<table>
<thead>
<tr>
<th>Value for mydt</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>21442</td>
<td>2018-09-15</td>
</tr>
</tbody>
</table>

---

### E8601DNw. Format

Writes dates from SAS datetime values by using the ISO 8601 extended notation `yyyy-mm-dd`.

Categories: CAS

- Date and Time
- ISO 8601

Alignment: Left

Alias: IS8601DN

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.2.1.1, complete representation
Syntax

E8601DNw.

Syntax Description

w
  specifies the width of the input field.

Default 10

Requirement The width of the input field must be 10.

Details

The E8601DN format writes the date by using the ISO 8601 extended date notation yyyy-mm-dd:

yyyy
  is a four-digit year.

mm
  is a two-digit month (zero padded) between 01 and 12.

dd
  is a two-digit day of the month (zero padded) between 01 and 31.

Example

```plaintext
data one;
  mydt='15sep2018 14:52:22'dt;
  put mydt e8601dn.;
run;
```

<table>
<thead>
<tr>
<th>Value for mydt</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1852642342</td>
<td>2018-09-15</td>
</tr>
</tbody>
</table>

See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

E8601DTw.d Format

Writes datetime values by using the ISO 8601 extended notation yyyy-mm-ddThh:mm:ss.ffffff.

Categories:

- CAS
- Date and Time
- ISO 8601
Restriction: UTC time zone offset values are not supported.

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Supports: ISO 8601 Element 5.4.1, complete representation

Syntax

E8601DT\textsubscript{\textit{w}.\textit{d}}

Syntax Description

\textit{w}

specifies the width of the input field.

Default 19

Range 16–26

\textit{d}

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0

Range 0–6

Details

The E8601DT format writes datetime values by using the ISO 8601 extended datetime notation \textit{yyyy-mm-ddThh:mm:ss.ffffff}:

\textit{yyyy}

is a four-digit year.

\textit{mm}

is a two-digit month (zero padded) between 01 and 12.

\textit{dd}

is a two-digit day of the month (zero padded) between 01 and 31.

\textit{hh}

is a two-digit hour (zero padded) between 00 and 23.

\textit{mm}

is a two-digit minute (zero padded) between 00 and 59.

\textit{ss}

is a two-digit second (zero padded) between 00 and 59.

\textit{ffffff}

are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.
Note: If you specify a width of 16, SAS assumes that the value for seconds is 0 and omissions from the output.

Example

```sas
data one;
  mydt='15sep2018 14:52:22'dt;
  put mydt e8601dt25.3;
run;
```

<table>
<thead>
<tr>
<th>Value of mydt</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1852642342</td>
<td>2018-09-15T14:52:22.000</td>
</tr>
</tbody>
</table>

E8601DXw. Format

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone extended notation yyyy-mm-ddThh:mm:ss±hh:mm.

Categories: Date and Time
ISO 8601

Alignment: Left

Supports: ISO 8601 Element 5.4.1, complete representation

Syntax

`E8601DXw.`

Syntax Description

`w`

specifies the width of the output field.

Default 26

Range 20–35

Details

UTC values specify a date and time that are based on the zero meridian in Greenwich, England. Using this format, SAS converts a datetime value to the UTC
value and determines the user local date and time by using the value of the
TIMEZONE= system option. If the TIMEZONE= option is not set, the user local date
and time are based on the local date and time. The E8601DX format writes SAS
datetime values by using this ISO 8601 basic datetime notation:

\[
\text{yyyy-mm-ddThh:mm:ss+hh:mm}
\]

\(\text{yyyy}\)

is a four-digit year.

\(\text{mm}\)

is a two-digit month (zero padded) between 01 and 12.

\(\text{dd}\)

is a two-digit day of the month (zero padded) between 01 and 31.

\(\text{hh}\)

is a two-digit hour (zero padded) between 00 and 23.

\(\text{mm}\)

is a two-digit minute (zero padded) between 00 and 59.

\(\text{ss}\)

is a two-digit second (zero padded) between 00 and 59.

\(\text{+|–hh:mm}\)

is an hour and minute signed offset from zero meridian time. The offset must be
\(\text{+|–hh:mm}\) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of
the zero meridian. For example, +02:00 indicates a two-hour time difference to
the east of the zero meridian, and –06:00 indicates a six-hour time difference to
the west of the zero meridian.

**Restriction:** The shorter form \(+|–hh\) is not supported.

### Example

The first example uses the local time to determine the time. The second example
changes the time zone to America/Adak, which is Hawaii-Aleutian Time.

### See Also

"Working with Dates and Times by Using the ISO 8601 Basic and Extended
Notations" on page 43
E8601DZw. Format

Writes datetime values for the zero meridian Coordinated Universal Time (UTC) by using the ISO 8601 datetime and time zone extended notation `yyyy-mm-ddThh:mm:ss+00:00`.

Categories: CAS
Date and Time
ISO 8601

Alignment: Left
Alias: IS8601DZw.

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.1, complete representation

Syntax

`E8601DZw`. 

Syntax Description

- `w` specifies the width of the output field.
  - Default: 26
  - Range: 20–35

Details

UTC values specify a time and a time zone based on the zero meridian in Greenwich, England. The E8601DZ format writes SAS datetime values by using one of these ISO 8601 extended datetime notations:

- `yyyy-mm-ddThh:mm:ss+00:00`
  - Note: Use this form when `w` is large enough to support this time zone notation.

- `yyyy-mm-ddThh:mm:ssZ`
  - Note: Use this form when `w` is not large enough to support the +00:00 time zone notation.

- `yyyy`
  - is a four-digit year.

- `mm`
  - is a two-digit month (zero padded) between 01 and 12.

- `dd`
  - is a two-digit day of the month (zero padded) between 01 and 31.
is a two-digit hour (zero padded) between 00 and 24.

*mm*

is a two-digit minute (zero padded) between 00 and 59.

*ss*

is a two-digit second (zero padded) between 00 and 59.

+00:00 indicates that the time is for zero meridian (Greenwich, England) time.

An ISO 8601 time or datetime value that specifies a time zone offset is adjusted by the number of hours and minutes that is specified in the offset and processed as the time or datetime for the zero meridian (Greenwich, England). The E8601DZ format always writes the datetime value by using the zero meridian offset value of +00:00. To write a datetime that uses the UTC offset other than +00:00, see “E8601LZw. Format” on page 190.

**Restriction:** The shorter form +00 is not supported.

Z indicates that the time is for zero meridian (Greenwich, England) or +00:00 UTC. Z is used when the width of the format does not support the +00:00 notation.

**Example**

data one;
  mydt='15sep2018 14:52:22'dt;
  put mydt e8601dz.;
run;

<table>
<thead>
<tr>
<th>Value of mydt</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1852642342</td>
<td>2018-09-15T14:52:22+00:00</td>
</tr>
</tbody>
</table>

**See Also**

“Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 43

---

**E8601LXw. Format**

Writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 extended notation *yyyy-mm-ddThh:mm:ss|--hh:mm*.

**Categories:** Date and Time

ISO 8601

**Alignment:** Right

**Supports:** ISO 8601 Elements 5.3.3 and 5.3.4.2
Syntax

**E8601LX**\(w\)

**Syntax Description**

\(w\)

specifies the width of the output field.

**Default**

26

**Range**

20–35

**Details**

The E8601LX format writes datetime values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using this ISO 8601 basic datetime notation:

\[ yyyy-mm-ddT\text{hh:mm:ss}+\text{hh:mm} \]

- \( yyyy\) is a four-digit year.

- \( mm\) is a two-digit month (zero padded) between 01 and 12.

- \( dd\) is a two-digit day of the month (zero padded) between 01 and 31.

- \( hh\) is a two-digit hour (zero padded) between 00 and 23.

- \( mm\) is a two-digit minute (zero padded) between 00 and 59.

- \( ss\) is a two-digit second (zero padded) between 00 and 59.

- \( +|–\text{hh:mm}\) is an hour and minute signed offset from zero meridian time. The offset must be \( +|–\text{hh:mm}\) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and –06:00 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form \(+|–\text{hh}\) is not supported.

**Example**

This example writes the time for the Eastern time zone:

```sas
data one;
    mydt='15sep2018 T12:34:56'dt;
    put mydt e8601lx.
run;
```
E8601LZw. Format

 Writes time values as local time, appending the Coordinated Universal Time (UTC) offset for the local SAS session, using the ISO 8601 extended time notation \texttt{hh:mm:ss+|–hh:mm}.

 Categories: 
 - CAS
 - Date and Time
 - ISO 8601

 Alignment: Left

 Alias: IS8601LZw.

 Supports: ISO 8601 Element 5.3.1.1, complete representation

 Syntax

 \texttt{E8601LZw}.

 Syntax Description

 \texttt{w}

 specifies the width of the output field.

 Default 14

 Range 9–20

 Details

 The E8601LZ format writes time values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using one of these ISO 8601 extended time notations:

 - \texttt{hh:mm:ss+|–hh:mm}

 Note: Use this form when \texttt{w} is large enough to support this time notation.

 - \texttt{hh:mm:ssZ}
Note: Use this form when w is not large enough to support the +|– hh:mm time zone notation.

hh

is a two-digit hour (zero padded) between 00 and 23.

mm

is a two-digit minute (zero padded) between 00 and 59.

ss

is a two-digit second (zero padded) between 00 and 59.

+|– hh:mm

is an hour and minute signed offset from zero meridian time. The offset must be +|– hh:mm (that is, + or – and five characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and –06:00 indicates a six-hour time difference to the west of the zero meridian.

Restriction: The shorter form +|– hh is not supported.

Z

indicates zero meridian (Greenwich, England) or +00:00 UTC.

SAS writes the time value by using the form hh:mm.ffffff, and appends the time zone indicator +|– hh:mm based on the time zone offset from the zero meridian for the local SAS session, or Z. The Z time zone indicator is used for format lengths that are less than 14.

If the same time is written using both zone indicators, they indicate two different times based on the UTC. For example, if the local SAS session uses Eastern Time in the U.S., and the time value is 45824, SAS would write 12:43:44–04:00 or 16:43:44Z. The time 12:43:44–04:00 is the time 16:43:44+00:00 at the zero meridian. The Z indicates that the time is the time at the zero meridian, or 12:43:44+00:00.

When SAS reads a UTC time by using the E8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 00:00:00 and 24:00:00. If the E8601LZ format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

Example

This example writes the time for the Eastern Time zone:

```sas
data one;
  mytime='14:52:26't;
  put mytime e8601lz.;
run;
```

<table>
<thead>
<tr>
<th>Value of mytime</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>53546</td>
<td>14:52:26-05:00</td>
</tr>
</tbody>
</table>

---

**E8601TMw.d Format**

Writers time values by using the ISO 8601 extended notation `hh:mm:ss.fffffff`.

**Categories:**
- CAS
- Date and Time
- ISO 8601

**Alignment:** Left

**Alias:** IS8601TMw.d

**Restriction:** UTC time zone offset values are not supported.

**Interaction:** When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Supports:**
- ISO 8601 Element 5.3.1.1, complete representation, and 5.3.1.3, representation of decimal fractions

---

**Syntax**

`E8601TMw.d`

**Syntax Description**

`w`

specifies the width of the output field.

- Default: 8
- Range: 8–15

`d`

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

- Default: 0
- Range: 0–6

---

**Details**

The E8601TM format writes SAS time values by using the ISO 8601 extended time notation `hh:mm:ss.fffffff`.

`hh`

is a two-digit hour (zero padded) between 00 and 23.
is a two-digit minute (zero padded) between 00 and 59.

ss

is a two-digit second (zero padded) between 00 and 59.

 are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

Example

data one;
  mytime='14:52:26't;
  put mytime e8601tm.;
run;

<table>
<thead>
<tr>
<th>Value of mytime</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>53546</td>
<td>14:52:26</td>
</tr>
</tbody>
</table>

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

E8601TXw. Format

Adjusts a Coordinated Universal Time (UTC) value to the user’s local time. Then, writes the local time by using the ISO 8601 extended time notation \(hh:mm:ss\pm hh:mm\).

Categories: Date and Time

ISO 8601

Alignment: Right

Supports: ISO 8601 Elements 5.3.3 and 5.3.4

Syntax

E8601TX\(w\).

Syntax Description

\(w\)

specifies the width of the output field.

Default 14

Range 9–20
Details
UTC values specify a time based on the zero meridian in Greenwich, England. Using this format, SAS converts a time value to the UTC value and determines the user local time by using the value of the TIMEZONE= system option. If the TIMEZONE= option is not set, the user local time is based on the local time. The E8601TX format writes SAS datetime values by using this ISO 8601 basic time notation:

- \( hh:mm:ss \pm hh:mm \)

- \( hh \)
is a two-digit hour (zero padded) between 00 and 23.

- \( mm \)
is a two-digit minute (zero padded) between 00 and 59.

- \( ss \)
is a two-digit second (zero padded) between 00 and 59.

- \( +|-hh:mm \)
is an hour and minute signed offset from zero meridian time. The offset must be \( +|-hhmm \) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form \( +|-hh \) is not supported.

When SAS reads a UTC time by using the E8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 000000 and 240000. If the E8601TX format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

Example
The first example uses the local time to determine the time and the time zone offset. The second example changes the time zone to America/Adak, which is Hawaii-Aleutian Time.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>

<td>07:34:56-05:00</td>
</tr>
<tr>
<td>options timezone='America/Adak'; data <em>null</em>; t='12:34:56't; put t e8601tx.; run;</td>
<td>02:34:56-10:00</td>
</tr>
</tbody>
</table>
E8601TZw.d Format

Adjusts time values to the Coordinated Universal Time (UTC) and writes the time values by using the ISO 8601 extended notation hh:mm:ss.<fff>+|–hh:mm.

Syntax

E8601TZw.d

Syntax Description

w

specifies the width of the output field.

Default 14

Range 9–20

d

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0

Range 0–6

Details

UTC time values specify a time and a time zone based on the zero meridian in Greenwich, England. The E8601TZ format writes time values in one of these ISO 8601 extended time notations:

- hh:mm:ss<fff>+|–hh:mm

Note: Use this form when w is large enough to support this time zone notation.
Note: Use this form when \( w \) is not large enough to support the \( +[-hh:mm] \) time zone notation.

- **hh:mm:ssZ**
  - \( hh \) is a two-digit hour (zero padded) between 00 and 23.
  - \( mm \) is a two-digit minute (zero padded) between 00 and 59.
  - \( ss \) is a two-digit second (zero padded) between 00 and 59.
  - \( .fff \) are optional fractional seconds.
  - \( +[-hh:mm] \) is a hour and minute signed offset from zero meridian time. The offset must be \( +[-hh:mm] \) (that is, + or – and five characters).
  - **Restriction:** The shorter form \( +[-hh] \) is not supported.
  - Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and –06:00 indicates a six-hour time difference to the west of the zero meridian.
  - \( Z \) indicates zero meridian (Greenwich, England) or +00:00 UTC time.

When SAS reads a UTC time by using the E8601TZ informat and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 00:00:00 and 24:00:00. If the E8601TZ format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

**Comparisons**

For time values between 00:00:00 and 24:00:00, the E8601TZ format adjusts the time value to be the time at the zero meridian and writes the time value in the international standard extended time notation. The E8601LZ format makes no adjustment to the time and writes time values in the international standard extended time notation, using a UTC time zone offset for the local SAS session.

**Example**

```sas
data _null_
  input @1 time e8601tz.;
  put times=;
  put time e8601tz.;
datalines;
  23:43:44-05:00
  23:43:44Z
run;
```
<table>
<thead>
<tr>
<th>Statement</th>
<th>Value of time</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put time=;</td>
<td>17024</td>
<td>04:43:44+00:00</td>
</tr>
<tr>
<td>put time e8601tz.;</td>
<td>85424</td>
<td>23:43:44+00:00</td>
</tr>
</tbody>
</table>

"Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 43

EUROw.d Format

Writes numeric values with a leading euro symbol (E), a comma that separates every three digits, and a period that separates the decimal fraction.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

**EUROw.d**

Syntax Description

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>w</strong></td>
<td>specifies the width of the output field.</td>
<td></td>

Format:
- “EUROXw.d Format” on page 200

Informats:
EUROXw.d Format

Writes numeric values with a leading euro symbol (E), a period that separates every three digits, and a comma that separates the decimal fraction.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

EUROXw.d

Syntax Description

w
specifies the width of the output field.

Default 6
Range 1-32
Tip If you want the euro symbol to be part of the output, be sure to choose an adequate width.

d
specifies the number of digits to the right of the decimal point in the numeric value.

Default 0
Range 0-31
Requirement must be less than w

Comparisons

- The EUROXw.d format is similar to the EUROW.d format, but EUROW.d format reverses the roles of the comma and the decimal point. This convention is common in English–speaking countries.
- The EUROXw.d format is similar to the DOLLARXw.d format, except that DOLLARXw.d format writes a leading dollar sign instead of the euro symbol.

Example

These examples use 1254.71 as the value of amount.
<table>

Informats:

FLOATw.d Format
Generates a native single-precision, floating-point value by multiplying a number by 10 raised to the $d$th power.

Categories: CAS
          Numeric

Alignment: Left

Syntax
FLOAT $w.d$

Syntax Description

$w$
  specifies the width of the output field.

Requirement width must be 4

$d$
  specifies the power of 10 by which to multiply the value. This argument is optional.

Default 0

Range 0–31

Details
This format is useful in operating environments where a float value is not the same as a truncated double. Values that are written by FLOAT4. are typically meant to be read by some other external program that runs in your operating environment and that expects these single-precision values.
Note: If the value that is to be formatted is a missing value, or if it is out-of-range for a native single-precision, floating-point value, a single-precision value of zero is generated.

On IBM mainframe systems, a four-byte floating-point number is the same as a truncated eight-byte floating-point number. However, in operating environments using the IEEE floating-point standard, such as IBM PC-based operating environments and most UNIX operating environments, a four-byte floating-point number is not the same as a truncated double. Hence, the RB4. format does not produce the same results as the FLOAT4. format. Floating-point representations other than IEEE might have this same characteristic.

Comparisons

The following table compares the names of float notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Float Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>FLOAT4</td>
</tr>
<tr>
<td>Fortran</td>
<td>REAL+4</td>
</tr>
<tr>
<td>C</td>
<td>float</td>
</tr>
<tr>
<td>IBM 370 ASM</td>
<td>E</td>
</tr>
<tr>
<td>PL/I</td>
<td>FLOAT BIN(21)</td>
</tr>
</tbody>
</table>

Example

```plaintext
data one;
data one;	 x=1;	 x=1;	 y=put(x,float4.);	 y=put(x,float4.);	 put y;	 put y;	 put y hex.;	 put y hex.;	run;
run;
```

The result of the put y=; statement shows the character representation of the underlying hexadecimal values. The result of the put y=hex.; statement shows the hexadecimal value that the FLOAT format produced. The result is a hexadecimal representation of a binary number that is stored in little-endian form. Big-endian IEEE systems store the hexadecimal representation as 3F800000.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Value of y</th>
</tr>
</thead>
<tbody>
<tr>
<td>put y=;</td>
<td>€?</td>
</tr>
<tr>
<td>put y=hex.;</td>
<td>0000803F</td>
</tr>
</tbody>
</table>
FRACTw. Format

Converts numeric values to fractions.

Categories:
- CAS
- Numeric

Alignment: Right

Syntax

\texttt{FRACTw.}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default 10

Range 4–32

Details

Dividing the number 1 by 3 produces the value 0.33333333. To write this value as \(\frac{1}{3}\), use the FRACTw. format. FRACTw. writes fractions in reduced form (for example, \(\frac{1}{2}\) instead of \(\frac{50}{100}\)).

Example

```plaintext
data one;
  input x;
  datalines;
  0.6666666667
  0.2784
;
run;

data two;
  set one;
  put x fract8.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.6666666667</td>
<td>(\frac{2}{3})</td>
</tr>
<tr>
<td>0.2784</td>
<td>(\frac{174}{625})</td>
</tr>
</tbody>
</table>
HEXw. Format

Converts real binary (floating-point) values to hexadecimal representation.

Categories:
- CAS
- Numeric

Alignment: Left

See:
- “HEXw. Format: Windows” in SAS Companion for Windows
- “HEX Format: UNIX” in SAS Companion for UNIX Environments

Syntax

HEXw.

Syntax Description

w

specifies the width of the output field.

Default 8

Range 1–16

Tip If w<16, the HEXw. format converts real binary numbers to fixed-point integers before writing them as hexadecimal characters. It also writes negative numbers in two's-complement notation, and right-aligns digits. If w is 16, HEXw. displays floating-point values in their hexadecimal form.

Details

In any operating environment, the least significant byte written by HEXw. is the rightmost byte. Some operating environments store integers with the least significant digit as the first byte. The HEXw. format produces consistent results in any operating environment regardless of the order of significance by byte.

Note: Different operating environments store floating-point values in different ways. However, the HEX16. format writes hexadecimal representations of floating-point values with consistent results in the same way that your operating environment stores them.

Comparisons

The HEXw. numeric format and the $HEXw. character format both generate the hexadecimal equivalent of values.
Example

data one;
  input x;
  datalines;
  35.4
  88
  2.33
  -150
;
run;

data two;
  set one;
  put x hex8.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>35.4</td>
<td>00000023</td>
</tr>
<tr>
<td>88</td>
<td>00000058</td>
</tr>
<tr>
<td>2.33</td>
<td>00000002</td>
</tr>
<tr>
<td>-150</td>
<td>FFFFFFF6A</td>
</tr>
</tbody>
</table>

HHMMw.d Format

Writes time values as hours and minutes in the form \textit{hh:mm}.

Categories: CAS, Date and Time

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in \textit{SAS System Options: Reference}.

Syntax

\texttt{HHMMw.d}

Syntax Description

\texttt{w}

specifies the width of the output field.
Default 5
Range 2–20

d specifies the number of digits to the right of the decimal point in the minutes value. The digits to the right of the decimal point specify a fraction of a minute. This argument is optional.

Default 0
Range 0–19
Requirement must be less than \( w \)

Details
The HHMMw.d format writes SAS time values in the form \( hh:mm \):

\( hh \)
is an integer.

---

Note: If \( hh \) is a single digit, HHMMw.d places a leading blank before the digit. For example, the HHMMw.d format writes 9:00 instead of 09:00.

\( mm \)
is an integer between 00 and 59 that represents minutes.

SAS rounds hours and minutes that are based on the value of seconds in a SAS time value.

The HHMM format uses asterisks to format values that are outside the time range 0–24 hours, such as datetime values.

Comparisons
The HHMMw.d format is similar to the TIMEw.d format except that the HHMMw.d format does not print seconds.

The HHMMw.d format writes a leading blank for a single-hour digit. The TODw.d format writes a leading zero for a single-hour digit.

Example
```sas
data a;
  mytime='12:59:56't;
  put mytime hhmm.;
  put mytime hhmm8.2;
run;
```

In the first example, SAS rounds up the time value 4 seconds based on the value of seconds in the SAS time value. In the second example, adding a decimal specification of 2 to the format shows that 56 seconds is 93% of a minute.
### HOURw.d Format

Writes time values as hours and decimal fractions of hours.

<table>
<thead>
<tr>
<th>Categories</th>
<th>CAS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Date and Time</td>
</tr>
</tbody>
</table>

| Alignment          | Right                        |

| Interaction        | When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference. |

#### Syntax

```
HOURw.d
```
Syntax Description

\[ w \]
- specifies the width of the output field.
  
  Default: 2
  
  Range: 2–20

\[ d \]
- specifies the number of digits to the right of the decimal point in the hour value. Therefore, SAS prints decimal fractions of the hour. This argument is optional.
  
  Range: 0–19
  
  Requirement: must be less than \( w \)

Details

SAS rounds hours based on the value of minutes in the SAS time value.

The HOUR format uses asterisks to format values that are outside the time range 0–24 hours, such as datetime values.

Example

```sas
data a;
  mytime='12:59:56't;
  put mytime hour.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mytime hour;</td>
<td>13</td>
</tr>
</tbody>
</table>

**IBw.d Format**

Writes native integer binary (fixed-point) values, including negative values.

**Category:** Numeric

**Alignment:** Left

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**See:**
- “IB Format: UNIX” in SAS Companion for UNIX Environments
- “IBw.d Format: Windows” in SAS Companion for Windows
- “IBw.d Format: z/OS” in SAS Companion for z/OS

---

**Syntax**

\[ \text{IBw.d} \]

---

**Syntax Description**

- **w**
  - Specifies the width of the output field.
  - **Default:** 4
  - **Range:** 1–8

- **d**
  - Specifies to multiply the number by 10\(d\). This argument is optional.
  - **Default:** 0
  - **Range:** 0–10

---

**Details**

The IBw.d format writes integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. IBw.d writes integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

---

**Note:** Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 35.
Comparisons

The IBw.d and PIBw.d formats are used to write native format integers. (Native format enables you to read and write values created in the same operating environment.) The IBRw.d and PIBRw.d formats are used to write little endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see "Writing Data Generated on Big Endian and Little Endian Platforms" on page 35.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

Example

data _null_
    x=128;
    y=put(x,ib4.);
    put y $hex8.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result on Big Endian Platforms</th>
<th>Result on Little Endian Platforms</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>00000080</td>
<td>80000000</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a four-byte integer binary number. Each byte occupies one column of the output field.

See Also

Formats:
- "IBRw.d Format" on page 211

IBRw.d Format

Writes integer binary (fixed-point) values in Intel and DEC formats.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

IBRw.d
Syntax Description

\(w\)

specifies the width of the output field.

Default 4

Range 1–8

\(d\)

specifies to multiply the number by \(10^d\). This argument is optional.

Default 0

Range 0–10

Details

The IBR\(w.d\) format writes integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. IBR\(w.d\) writes integer binary values that are generated by and for Intel and DEC operating environments. Use IBR\(w.d\) to write integer binary data from Intel or DEC environments on other operating environments. The IBR\(w.d\) format in SAS code allows for a portable implementation for writing the data in any operating environment.

**Note:** Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms" on page 35.

Comparisons

- The IB\(w.d\) and PIB\(w.d\) formats are used to write native format integers. (Native format enables you to read and write values that are created in the same operating environment.)
- The IB\(w.d\) and PIB\(w.d\) formats are used to write little endian integers, regardless of the operating environment that you are writing on.
- In Intel and DEC operating environments, the IB\(w.d\) and IBR\(w.d\) formats are equivalent.

To view the type of format to use with big endian and little endian integers, see "Writing Data Generated on Big Endian and Little Endian Platforms" on page 35.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

Example

```sas
    data _null_
    x=128;
    y=put(x,ibr4.);
    put y $hex8.;
    run;
```
Value of x | Result
---|---
128 | 80000000

1 The result is a hexadecimal representation of a 4-byte integer binary number. Each byte occupies one column of the output field.

See Also

**Formats:**
- "IBw.d Format" on page 210

### IEEEw.d Format

Generates an IEEE floating-point value by multiplying a number by 10 raised to the $d$th power.

*Categories:* CAS, Numeric

*Alignment:* Left

*CAUTION:* Large floating-point values and floating-point values that require precision might not be identical to the original SAS value when they are written to an IBM mainframe using the IEEE format and read back into SAS using the IEE informat.

#### Syntax

**IEEE\textit{w.d}**

#### Syntax Description

**$w$**

Specifies the width of the output field.

- **Default:** 8
- **Range:** 1–8
- **Tip:** If $w$ is 8, an IEEE double-precision, floating-point number is written. If $w$ is 5, 6, or 7, an IEEE double-precision, floating-point number is written, which assumes truncation of the appropriate number of bytes. If $w$ is 4, an IEEE single-precision floating-point number is written. If $w$ is 3, an IEEE single-precision, floating-point number is written, which assumes truncation of 1 byte.

**$d$**

Specifies to multiply the number by $10^d$. This argument is optional.

- **Default:** 0
- **Range:** 0–10
Details

This format is useful in operating environments where IEEEw.d is the floating-point representation that is used. In addition, you can use the IEEEw.d format to create files that are used by programs in operating environments that use the IEEE floating-point representation.

Typically, programs generate IEEE values in single-precision (4 bytes) or double-precision (8 bytes). Programs perform truncation solely to save space on output files. Machine instructions require that the floating-point number be one of the two lengths. The IEEEw.d format allows other lengths, which enables you to write data to files that contain space-saving truncated data.

Example

data _null_;  
x=1;  
test1=put(x,ieee4.);  
put test1 $hex8.;  
test2=put(x,ieee5.);  
put test2 $hex10.;  
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result$^1$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3F800000</td>
</tr>
<tr>
<td></td>
<td>3FF0000000</td>
</tr>
</tbody>
</table>

$^1$ The result contains hexadecimal representations of binary numbers stored in IEEE form.

JULDAYw. Format

Writes date values as the Julian day of the year.

Category: Date and Time

Alignment: Right

Restriction: This format is not supported in a DATA step that runs in CAS.

See: “Julian Date Formats and Astronomical Dates” on page 10

Syntax

**JULDAYw.**

Syntax Description

w

specifies the width of the output field.

Default 3
Details

The JULDAYw. format writes SAS date values in the form ddd. In this syntax, the letter d is defined as follows:

\[
\text{ddd}
\]

is the number of the day, 1–365 (or 1–366 for leap years).

Example

```sas
data one;
  input date :mmddyy10.;
datalines;
01/12/2018
07/04/2018;
run;

data two;
set one;
  put date julday3.;
run;
```

The example table uses the input values of 21196, which is the SAS date value that corresponds to January 12, 2018, and 21369, which is the SAS date value that corresponds to July 4, 2018.

<table>
<thead>
<tr>
<th>Input Value</th>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>21196</td>
<td>put date julday3.;</td>
<td>12</td>
</tr>
<tr>
<td>21369</td>
<td>put date julday3.;</td>
<td>185</td>
</tr>
</tbody>
</table>

JULIANw. Format

Writes date values as Julian dates in the form yyddd or yyyyddd.

Categories: CAS

Date and Time

Alignment: Left

See: “Julian Date Formats and Astronomical Dates” on page 10
Syntax

**JULIAN\(w\).**

Syntax Description

\(w\)

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>5–7</td>
</tr>
</tbody>
</table>

**Tip**

If \(w\) is 5, the JULIAN\(w\) format writes the date with a two-digit year. If \(w\) is 7, the JULIAN\(w\) format writes the date with a four-digit year.

Details

The JULIAN\(w\) format writes SAS date values in the form \(yyddd\) or \(yyyyddd\):

- \(yy\) or \(yyyy\)
  - is a two-digit or four-digit integer that represents the year.

- \(ddd\)
  - is the number of the day, 1–365 (or 1–366 for leap years), in that year.

Example

```sas
data one;
  input date :mmddyy10.;;
datalines;
  07/04/2018;
run;

data two;
  set one;
  put date julian5.;;
  put date julian7.;;
run;
```

The example table uses the input value of 21369, which is the SAS date value that corresponds to July 4, 2018 (the 185th day of the year).

S y n t a x  D e s c r i p t i o n

\textit{w}

\begin{itemize}
  \item \textbf{w} specifies the width of the output field.
  \item \textbf{Default:} 19
  \item \textbf{Range:} 8–40
\end{itemize}

\textit{d}

\begin{itemize}
  \item \textbf{d} specifies the number of digits to the right of the decimal point in the minutes value. This argument is optional.
  \item \textbf{Default:} 0
  \item \textbf{Range:} 0–39
\end{itemize}

D e t a i l s

T h e  \textit{MDYAMPMw.d}  f o r m a t  w r i t e s  S A S  d a t e t i m e  v a l u e s  i n  t h e  f o l l o w i n g  f o r m:

\textit{mm/dd/yy<yy>}  \textit{hh:mm<AM | PM>:}
$mm$
is an integer between 1 and 12 that represents the month.

$dd$
is an integer between 1 and 31 that represents the day of the month.

$yy$ or $yyyy$
specifies a two-digit or four-digit integer that represents the year.

$hh$
is an integer between 00 and 23 that represents hours.

$mm$
is an integer between 00 and 59 that represents minutes.

AM | PM
specifies either the time period 00:01−12:00 noon (AM) or the time period 12:01−12:00 midnight (PM). The default is AM.

date and time separator characters
is one of several special characters, such as the slash (/), colon (:), or a blank character that SAS uses to separate date and time components.

Comparisons
The MDYAMPMw. format writes datetime values with separators in the form $mm/dd/yyyy hh:mm\ AM|PM$, and requires a space between the date and the time.

The DATETIMEw.d format writes datetime values with separators in the form $ddmmmyy/yyyy: hh:mm:ss.ss$.

Example
```
data one;
  mydt='04jul2018 14:58:23'dt;
  put mydt mdyampm25.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>

MMDDYYw. Format

Writes date values in the form \textit{mmdd<yy>yy} or \textit{mm/dd<yy>yy}, where a forward slash is the separator and the year appears as either two or four digits.

\begin{itemize}
  \item **Categories:** CAS, Date and Time
  \item **Alignment:** Right
\end{itemize}

**Syntax**

\texttt{MMDDYYw.}

**Syntax Description**

\textit{w}

specifies the width of the output field.

\begin{itemize}
  \item **Default:** 8
  \item **Range:** 2–10
  \item **Interaction:** When \textit{w} has a value from 2 to 5, the date appears with as much of the month and the day as possible. When \textit{w} is 7, the date appears as a two-digit year without slashes.
\end{itemize}

**Details**

The \texttt{MMDDYYw.} format writes SAS date values in one of these forms:

\texttt{mmdd<yy>yy}

\texttt{mm/dd<yy>yy}.

In this syntax, the letters \textit{m}, \textit{d}, and \textit{y} and the forward slash are defined as follows:

\textit{mm}

is an integer that represents the month.

\textit{/}

is the separator.

\textit{dd}

is an integer that represents the day of the month.

\textit{<yy>yy}

is a two-digit or four-digit integer that represents the year.

**Example**

\begin{verbatim}
   data one;
       mydt='02may2018'd;
       put mydt mmddyy. ;
       put mydt mmddyy2. ;
\end{verbatim}
put mydt mmddyy3.;
put mydt mmddyy4.;
put mydt mmddyy5.;
put mydt mmddyy6.;
put mydt mmddyy7.;
put mydt mmddyy8.;
put mydt mmddyy10.;
run;

<table>

MMDDYYxw. Format

Writes date values in the form \texttt{mmdd<yy>yy} or \texttt{mm-dd<yy>yy}, where the \texttt{x} in the format name is a character that represents the special character that separates the month, day, and year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator; the year can be either two or four digits.

**Categories:** CAS
- Date and Time

**Alignment:** Right

**Syntax**

\texttt{MMDDYYxw}.

**Syntax Description**

\texttt{x}

identifies a separator or specifies that no separator appear between the month, the day, and the year. These are valid values for \texttt{x}:

- \texttt{B} separates with a blank.
- \texttt{C} separates with a colon.
- \texttt{D} separates with a hyphen.
- \texttt{N} indicates no separator.
- \texttt{P} separates with a period.
- \texttt{S} separates with a slash.

\texttt{w}

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>5–32</td>
</tr>
</tbody>
</table>

**Interactions**

When \texttt{w} has a value from 2 to 5, the date appears with as much of the month and the day as possible. When \texttt{w} is 7, the date appears as a two-digit year without separators.

When \texttt{x} has a value of \texttt{N}, the width range changes to 4–32.
Details
The MMDDYYxxw. format writes SAS date values in one of these forms:

\[ mmdd<yy>yy \]
\[ mmxda<yy>yy \]

In this syntax, the letters m, x, d, and y are defined as follows:

\[ mm \]
- is an integer that represents the month.

\[ x \]
- is a specified separator.

\[ dd \]
- is an integer that represents the day of the month.

\[ <yy>yy \]
- is a two-digit or four-digit integer that represents the year.

Example

```sas
data one;
  mydt='02may2018'd;
  put mydt mmddyyc5.;
  put mydt mmddyyd8.;
  put mydt mmddyyp10.;
  put mydt mmddyn8.;
run;
```

<table>
<thead>

**Functions:**
MMSSw.d Format

Writes time values as the number of minutes and seconds since midnight.

Categories: CAS
Date and Time

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

**MMSSw.d**

Syntax Description

- **w** specifies the width of the output field.

  Default 5

  Range 2–20

  Tip Set *w* to a minimum of 5 to write a value that represents minutes and seconds.

- **d** specifies the number of digits to the right of the decimal point in the seconds value. Therefore, the SAS time value includes fractional seconds. This argument is optional.

  Range 0–19

  Requirement *d* must be less than *w*.

Example

data a;
  x='8:30:21't;
  y='25:42:08't;
put x mmss8.;
put y mmss10.2;
run;

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x mmss8.;</td>
<td>510:21</td>
</tr>
<tr>
<td>put y mmss10.2;</td>
<td>1542:08.00</td>
</tr>
</tbody>
</table>

**MMYYw. Format**

Writes date values in the form $mmM<yy>yy$, where M is the separator and the year appears as either two or four digits.

**Categories:**
CAS
Date and Time

**Alignment:**
Right

**Syntax**

**MMYY**w.

**Syntax Description**

w

specifies the width of the output field.

Default 7
Range 5–32

Interaction
When \(w\) has a value of 5 or 6, the date appears with only the last two digits of the year. When \(w\) is 7 or more, the date appears with a four-digit year.

Details
The MMYYw. format writes SAS date values in the form \(mmM<yy>yy\). In this syntax, the letters \(m\), \(M\), and \(y\) are defined as follows:

- \(mm\)
  - is an integer that represents the month.

- \(M\)
  - is the character separator.

- \(<yy>yy\)
  - is a two-digit or four-digit integer that represents the year.

Example
```sas
data one;
  dte='15may2018'd;
  put dte mmyy.;
  put dte mmyy5.;
  put dte mmyy6.;
  put dte mmyy7.;
  put dte mmyy10.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dte mmyy.</td>
<td>05M2018</td>
</tr>
<tr>
<td>put dte mmyy5.</td>
<td>05M18</td>
</tr>
<tr>
<td>put dte mmyy6.</td>
<td>05M18</td>
</tr>
<tr>
<td>put dte mmyy7.</td>
<td>05M2018</td>
</tr>
<tr>
<td>put dte mmyy10.</td>
<td>05M2018</td>
</tr>
</tbody>
</table>

Formats:
- "MMYYXw. Format" on page 226
- "YYMMw. Format" on page 447
**MMYYxw. Format**

Writes date values in the form `mm<yy>yy` or `mm-<yy>yy`, where the `x` in the format name is a character that represents the special character that separates the month and the year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator. The year can be either two or four digits.

**Categories:** CAS  
**Date and Time**

**Alignment:** Right

**Syntax**

`MMYYxw`.

**Syntax Description**

- **x** identifies a separator or specifies that no separator appear between the month and the year. These are valid values for `x`:
  - C separates with a colon.
  - D separates with a hyphen.
  - N indicates no separator.
  - P separates with a period.
  - S separates with a forward slash.

- **w** specifies the width of the output field.

**Default** 7

**Range** 5–32

**Interactions**

When `x` is set to `N`, no separator is specified. The width range is then 4–32, and the default changes to 6.

When `x` has a value of C, D, P, or S and `w` has a value of 5 or 6, the date appears with only the last two digits of the year. When `w` is 7 or more, the date appears with a four-digit year.

When `x` has a value of N and `w` has a value of 4 or 5, the date appears with only the last two digits of the year. When `x` has a value of N and `w` is 6 or more, the date appears with a four-digit year.
Details

The MMYYxw. format writes SAS date values in one of these forms:

\[ mmyy <yy>yy \]
\[ mmx<yy>yy \]

In this syntax, the letters m, x, and y are defined as follows:

- **mm**
  - is an integer that represents the month.
- **x**
  - is a specified separator.
- **<yy>yy**
  - is a two-digit or four-digit integer that represents the year.

Example

```sas
data one;
  dte='15may2018'd;
  put dte mmyyc5.;
  put dte mmyyd.;
  put dte mmyyn4.;
  put dte mmyyp8.;
  put dte mmyys10.;
run;
```

MONNAMEw. Format

Writes date values as the name of the month.

Categories:
- CAS
- Date and Time

Alignment: Right

Syntax

MONNAMEw.

Syntax Description

w

specifies the width of the output field.

Default 9

Range 1–32

Tip Use MONNAME3. to print the first three letters of the month name.

Details

If necessary, SAS truncates the name of the month to fit the format width.

Example

data one;
  dte='15may2018'd;
  put dte monname.;
  put dte monname1.;
  put dte monname3.;
run;

<table>
<thead>

MONYYw. Format

Writes date values as the month and the year in the form \textit{mmmyy} or \textit{mmmyyyy}.

Categories: CAS
Date and Time

Alignment: Right

Syntax

\textbf{MONYYw.}

Syntax Description

\textit{w}

specifies the width of the output field.

\begin{tabular}{ll}
\textbf{Default} & 5 \\
\textbf{Range} & 5–7 \\
\end{tabular}

Details

The MONYYw. format writes SAS date values in the form \textit{mmmyy} or \textit{mmmyyyy}. In this syntax, the letters \textit{m} and \textit{y} are defined as follows:

\textit{mmm}

is the first three letters of the month name.

\textit{yy} or \textit{yyyy}

is a two-digit or four-digit integer that represents the year.

Comparisons

The MONYYw. format and the DTMONYYw. format are similar in that they both write date values. The difference is that MONYYw. expects a SAS date value as input, and DTMONYYw. expects a datetime value.

Example

\begin{verbatim}
data one;
dte='15may2018'd;
put dte monyy5.;
put dte monyy7.;
run;
\end{verbatim}
### NEGPARENw.d Format

Writes negative numeric values in parentheses.

**Categories:**
- CAS
- Numeric

**Alignment:**
- Right

**Interaction:**
When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

#### Syntax

**NEGPARENw.d**

#### Syntax Description

- \( w \)
  - specifies the width of the output field.

---

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put dte monyy$.;</td>
<td>MAY18</td>
</tr>
<tr>
<td>put dte monyy7.;</td>
<td>MAY2018</td>
</tr>
</tbody>
</table>

- "DTMONYYw. Format" on page 175
- "MMDDYYw. Format" on page 219
- "YYMMDDw. Format" on page 449

**Functions:**
- "MONTH Function" in SAS Functions and CALL Routines: Reference
- "YEAR Function" in SAS Functions and CALL Routines: Reference

**Informat:**
- "MONYYw. Informat" on page 589
\(d\) specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Details

The \texttt{NEGPARENw.d} format attempts to right-align output values. If the input value is negative, \texttt{NEGPARENw.d} displays the output by enclosing the value in parentheses, if the field that you specify is wide enough. Otherwise, it uses a minus sign to represent the negative value. If the input value is nonnegative, \texttt{NEGPARENw.d} displays the value with a leading and trailing blank to ensure proper column alignment. It reserves the last column for a close parenthesis even when the value is positive.

Comparisons

The \texttt{NEGPARENw.d} format is similar to the \texttt{COMMAw.d} format in that it separates every three digits of the value with a comma.

Example

```sas
data one;
  input x;
  datalines;
  100
  1000
  -200
  -2000
  ;
  run;

data two;
  set one;
  put x negparen$.;
  run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>1000</td>
<td>1,000</td>
</tr>
<tr>
<td>-200</td>
<td>(200)</td>
</tr>
</tbody>
</table>
NENGOw. Format

Writers date values as Japanese dates in the form e.yymmdd.

Category: Date and Time
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

NENGOw.

Syntax Description

w
specifies the width of the output field.

Default 10
Range 2–10

Details
The NENGOw. format writes SAS date values in the form e.yymmdd, where

e
is the first letter of the name of the imperial era (Meiji, Taisho, Showa, Heisei, or Reiwa).

yy
is an integer that represents the year.

mm
is an integer that represents the month.

dd
is an integer that represents the day of the month.

If the width is too small, SAS omits the period.

Example
The example table uses the input value of 15342, which is the SAS date value that corresponds to January 2, 2002.

data _null_
  date=15342;
### NLBESTw. Format

 Writes the best numerical notation based on the locale.

**Categories:**
- CAS
- Numeric

**Alignment:** Right

#### Syntax

**NLBESTw.**

#### Syntax Description

- **w** specifies the width of the output field.

  - **Default:** 12
  - **Range:** 1–32

**Tip**
If you print numbers between 0 and .01 exclusively, then use a field width of at least 7 to avoid excessive rounding. If you print numbers between 0 and -.01 exclusively, use a field width of at least 8.

#### Details

The NLBEST format writes the best numerical value based on the locale's decimal point and the sign mark's location. NLBEST is similar to the BEST format. For more information, see the BEST format in the *SAS Formats and Informats: Reference*.

NLDATEw. Format

Converts a SAS date value to the date value of the specified locale, and then writes the date value as a date.

Categories: CAS
Date and Time

Alignment: Left
Syntax

**NLDATEw.**

Syntax Description

* w  
  specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

<table>
<thead>
<tr>
<th>Default</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>10–200</td>
</tr>
</tbody>
</table>

Comparisons

NLDATEw. is similar to DATEw. and WORDDATEw. except that NLDATEw. is locale-specific.

Example

These examples use the input value of 15760, which is the SAS date value that corresponds to February 24, 2003. The first example specifies the english_United States locale. The second example specifies the german_Germany locale.

```sas
options locale=English_UnitedStates;
data test;
  day=15760;
  put day nldate.;
run;

February 24, 2003
```

```sas
options locale=German_Germany;
data test;
  day=15760;
  put day nldate.;
run;

24. Februar 2003
```

Syntax

NLDATELw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 18

Range 2–200

Details

NLDATEL writes the date in a long-uniform pattern with the full length of the month and week names.

Example

This example uses the date November 19, 2012.

```sas
data _null_
  dt = dt='19Nov2012:00:00:00'dt
  dy='19Nov2012'd
  put "+--- NLDATEL min=2 default=18 max=200 ----+
  max=200 ----+
  put dy nldatel.;
  put dy nldateln0.;
  put dy nldateln2.;
  put dy nldateln8.;
  put dy nldateln200.;
run;
```

Syntax

NLDATESw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 10

Range 2–200

Details

NLDATES writes the date in a short-uniform pattern that contains only numbers and delimiters, such as mm/dd/yyyy.

Example

This example specifies the date November 19, 2012. This example specifies the en_US locale.

```sas
option locale=en_US;
data _null_;  
dt = dt='19Nov2012:00:00:00'dt;  
dy='19Nov2012'd;  
put '++++ NLDATEMDL min=2 default=10 max=200 ----+';

11/19/2012
11/19/2012
NLDATEWw. Format

Converts a SAS date value to the date value of the specified locale, and then writes the value as the date and the day of the week.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

NLDATEWw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date and the day of the week to fit the format width.

Default 29

Range 10–200

Details

The NLDATEW format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Comparisons

NLDATEWw. is similar to WEEKDATEw. except that NLDATEWw. is locale specific.

Example

These examples use the input value of 15760, which is the SAS date value that corresponds to February 24, 2003. The first example specifies the en_US locale. The second example specifies the de_DE locale.

```sas
options locale=en_US;
data _null_;
dy=15760;
put dy nldatew.;
put dy nldatew20.;
put dy nldatew200.;
run;
```
options locale=de_DE;
data _null_
  dy=15760;
  put dy nldatew.;
  put dy nldatew20.;
  put dy nldatew200.;
run;

**Syntax**

NLDATEYMw.
Syntax Description

\( w \)

specifies the width of the output field.

Default: 16

Range: 6–200

Details

If you specify a width of 6, but your data is larger than 6, your output contains asterisks: \( d = \ast \ast \ast \ast \ast \). To remove the asterisks, you can use PROC LOCALEDATA.

The following example uses PROC LOCALEDATA to write the date without the asterisks:

```
PROC LOCALEDATA;
   LOAD SASLOCALE;
   MODIFY key=DATE_YYMM_SHORT_FORMAT value='%b %y' ;
   SAVE REGISTRY / _ALL_ syntax=SAS;
```

```
data _null_;  
   format d nldateym6.;  
   d = '17OCT14'd;  
   put d =;  
   run;
```

```
d=Oct 14
```

Example

This example specifies the spanish_Spain locale option. This example specifies the date of April 4, 2019.

```
options locale=spanish_Spain;  
data _null_;  
   dy=today();  
   put dy nldateym.;  
   put dy nldateym12.;  
   put dy nldateym200.;  
   run;
```

```
abril de 2019  
abr de 2019

NLDATMw. Format

Converts a SAS datetime value to the datetime value of the specified locale, and then writes the value as a datetime.

Categories: CAS
          Date and Time

Alignment: Left

Syntax

NLDATMw.

Syntax Description

w
  specifies the width of the output field. If necessary, SAS abbreviates the datetime value to fit the format width.

  Default  30
  Range    10–200

Comparisons

The NLDATMw. format is similar to the DATETIMEw. format except that the NLDATMw. format is locale-specific.

Example

These examples specify the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003. The first example specifies the en_US locale. The second example specifies the de_DE locale.

```sas
options locale=en_US;
data _null_;
  dy=1361709583;
  put dy nldatm.;
run;

24Feb2003:12:39:43

options locale=de_DE;
data _null_;
  dy=1361709583;
  put dy nldatm.;
run;

24. Februar 2003 12.39 Uhr
```
NLDATMAPw. Format

Converts a SAS datetime value to the datetime value of the specified locale, and then writes the value as a datetime with a.m. or p.m.

Categories:
- CAS
- Date and Time

Syntax

NLDATMAPw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date-time value to fit the format width.

Default 32

Range 16–200

Comparisons

The NLDATMAPw. format is similar to DATEAMPMw. except that the NLDATMAPw. format is locale-specific.

Example

These examples specify the input value of 1361709583, which is the SAS date-time value that corresponds to 12:39:43 p.m. on February 24, 2003. The first example specifies the en_US locale. The second example specifies the es_MX locale.

```sas
options locale=en_US;
data _null_;
dy=1361709583;
put dy nldatmap.;
run;
```

February 24, 2003 12:39:43 PM
options locale=es_MX;
data _null_;  
dy=1361709583;  
put dy nldatmap200.;  
run;

24 de febrero de 2003 12:39:43 p.m.

NLDATMLw. Format

Converts a SAS datetime value to the datetime string of the specified locale in the long representation of the date.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMLw.

Syntax Description

w
specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 30
Range 9–200

Details

NLDATML writes the date in a long-uniform pattern with the full length of the month, date, year, and time, such as April 10, 2019 03:13:27 PM.
Example

```sas
data _null_
  dt = datetime();
  dy = date();
  put "+--- NLDATML min=9 default=30 max=200 ---+
  put dt nldatml.;
  put dt nldatml19.;
  put dt nldatml24.;
  put dt nldatml30.;
  put dt nldatml200.;
run;
```

```

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the full-length of the month and day of the month.

Categories: CAS
Date and Time

Alignment: Left

Syntax

**NLDATMMDLw.**

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 12

Range 5–200

Details

NLDATMMDL writes the date in a long-uniform pattern with full-length of the month and the day, such as November 19.

Example

The following example uses the date of April 12, 2019.

```
data _null_;  
  dt = datetime();  
  dy = date();  
  put '+--- NLDATMMDL min=5 default=12  
    max=200 ----+';  
  put dt nldatmmdl.;  
  put dt nldatmmdl5.;
```
```sas
put dt nldatmmmdm9.;
put dt nldatmmmdm12.;
put dt nldatmmmdm200.;
run;
```

**Syntax**

**NLDATMMMDMw.**

**Syntax Description**

w

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

**Default**

9

**Range**

5–200

**Details**

NLDATMMMDM writes the date in a medium-uniform pattern with abbreviations of the month and the day, such as Nov 19.

**Example**

The following example uses the date of April 12, 2019.

```sas
data _null_;  
dt = datetime();  
dy = date();  
put '+--- NLDATMMMDM min=5 default=9 max=200 ----+';  
put dt nldatmmmdm.;  
put dt nldatmmmdm5.;
```
NLDATMMDSw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the month and day of the month using numbers and delimiters.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMMDS<sub>w</sub>.

Syntax Description

<code>W</code>

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 5

Range 5–200

Details

NLDATMMDS writes the date in a short-uniform pattern with numbers and delimiters of the month and the day, such as 4/12.

Example

The following example uses the date of April 12, 2019.

```sas
data _null_;
  dt = datetime();
  dy = date();
  put '+' NLDATMMDS min=5 default=9 max=200 '+';
  put dt nldatmmds.;
  put dt nldatmmds5.;
  put dt nldatmmds9.;
  put dt nldatmmds200.;
run;
```
NLDATMMNNw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the name of the month.

Categories: CAS
            Date and Time

Alignment: Left

Syntax

NLDATMMNNw.

Syntax Description

w

  specifies the width of the output field.

  Default  9
  Range    4–200

Example

This example uses the en_US locale option.

```sas
options locale=en_US;
data _null_;  dt = datetime();  dy = date();  put '+--- NLDATMMN min=5 default=10 max=200 ----+';  put dt nldatmmn.;  put dt nldatmmn4.;  put dt nldatmmn10.;  put dt nldatmmn200.;  run;
```

Apr
April
April
NLDATMSw. Format

Converts a SAS datetime value to the datetime string of the specified locale in the short representation of the date.

**Categories:**
- CAS
- Date and Time

**Alignment:** Left

**Syntax**

```
NLDATMSw.
```

**Syntax Description**

- `w` specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

**Default**

19

**Range**

9–200

**Details**

NLDATMS writes the date in a short-uniform pattern with number and delimiters, such as MM/DD/YYYY hh:mm:ss.

**Example**

This example uses the date April 12, 2019.

```
data _null_;  
dt = datetime();  
dy = date();  
put '+++ NLDATMS min=9 default=19 max=200+++';  
put dt nldatms.;  
put dt nldatms10.;  
put dt nldatms19.;  
put dt nldatms200.;  
run;
```

```++++ NLDATMS min=9 default=19 max=200++++
04/12/2019 11:50:53
041219 11
04/12/2019 11:50:53
04/12/2019 11:50:53```
NLDATMTMw. Format

Converts the time portion of a SAS datetime value to the time-of-day value of the specified locale, and then writes the value as a time of day.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMTMw.

Syntax Description

w
specifies the width of the output field.

Default 16
Range 16–200

Comparisons

The NLDATMTMw. format is similar to the TODw. format except that the NLDATMTMw. format is locale-specific.

Example

These examples use the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003.

This example specifies the English_United_States locale.

options locale=en_US;
data one;
   event=1361709583;
   put event nldatmtm.;
run;

12:39:43

This example specifies the German_Germany locale.

options locale=en_US;
data one;
   event=1361709583;
   put event nldatmtm.;
run;

- "NLDATMWW. Format" on page 272

NLDATMTZw. Format

Converts the time portion of the SAS datetime value to the time of day and time zone of the specified locale.

Categories: CAS
Date and Time

Alignment: Left

Syntax

**NLDATMTZw.**

Syntax Description

**w**

specifies the width of the output field.

Default 32
Range 16–200

Example

This example uses the current datetime value. This example specifies the French_France locale.

```
options locale=fr_FR;
data test;
x=datetime();
put x=nldatmtz.;
run;
```

x=10 h 08 -0400
NLDATMWW. Format

Converts SAS datetime values to the locale sensitive datetime string as the day of the week and the datetime.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

NLDATMWW.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the day of week and datetime to fit the format width.

<table>
<thead>
<tr>
<th>Default</th>
<th>41</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>16–200</td>
</tr>
</tbody>
</table>

Details

The NLDATMWW format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths for information about recommended widths for locale and encoding combinations. You might need to use the suggested width for the NLDATMWW format.

Comparisons

The NLDATMWW. format is similar to the TWMDYw. format except that the NLDATMWW. format is locale-specific.

Example

This example uses the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003. This example specifies the English_United States locale.

```sas
options locale=English_UnitedStates;
data one;
x=put(1361709583,nldatmww.);
y=put(1361709583,nldatmww30.);
z=put(1361709583,nldatmww200.);
put x=;
put y=;
put z=;
```
NLDATMWNw. Format

Converts a SAS datetime value to the datetime value of the specified locale, and then writes the value as the day of the week.

Categories:
- CAS
- Date and Time

Alignment:
- Left

Syntax

**NLDATMWNw.**

Syntax Description

- **w** specifies the width of the output field.
  - Default: 9
  - Range: 4–200

Example

This example writes the SAS datetime value as a day of the week. This example specifies the English_United States locale, which is the default SAS session encoding.

```sas
data _null_
  dt = datetime()
  dy = date()
  put '+--- NLDATMWN min=4 default=9 max=200 ----+';
  put dt nldatmwn;
  put dt nldatmwn4.;
  put dt nldatmwn9.;
```

04/19
04/2019
04/2019
```
NLDATMYQw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the quarter and the year.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMYQw.

Syntax Description

w

specifies the width of the output field.

Default 16

Range 4–200

Details

The NLDATMYQ format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Example

This example uses the en_US locale option.

```sas
options locale=en_US;
data _null_;   
  dy=today(); 
  dt=datetime(); 
  put "++++- NLDATMYQ min=4 default=16 max=200 ---++";
  put ' 16' +5 dt nldatmyq.;
  put '  4' +5 dt nldatmyq4.;
  put ' 14' +5 dt nldatmyq14.;
  put ' 32' +5 dt nldatmyq32.;
  put '200' +5 dt nldatmyq200.;
run;
```
NLDATMYQLw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year’s quarter value (1–4) and the year.

Category: Date and Time
Alignment: Left

Syntax

\texttt{NLDATMYQLw.}

Syntax Description

\textit{w}

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 18
Range 4–200

Details

NLDATMYQL writes the date in a long uniform pattern in full length of the year’s quarter and then the year, such as 4th quarter 2012.

Example

The following example uses the date of April 16, 2019. This example specifies the en_US locale.

```sas
options locale=en_US;
data _null_
  dt = datetime();
  dy = date();
  put '+' NLDATMYQL min=4 default=18 max=200 '+'
    16 2nd quarter 2019
    4 ****
    14 Q2 2019
    32 2nd quarter 2019
    200
    2nd quarter 2019
run;
```
NLDATMYQMw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year’s quarter (1–4) and then the year.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMYQMw.

Syntax Description

w
  specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

  Default   7
  Range    4–200

Details

NLDATMYQM writes the date in a medium-uniform pattern of the year’s quarter and then the year, such as Q2 2019.

Example

The following example uses the date of April 16, 2019.

```sas
data _null_
  dt = datetime();
  dy = date();
  put '+--- NLDATMYQM min=4 default=7 max=200 ----+
       2nd quarter 2019
       2019/2
       Q2 2019
       2nd quarter 2019
       2nd quarter 2019';
  put dt nldatmyqm.;
  put dt nldatmyqm6.;
  put dt nldatmyqm7.;
  put dt nldatmyqm200.;
run;
```
NLDATMYQSw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year and the quarter (1-4) using numbers and a delimiter.

Categories:
- CAS
  - Date and Time

Alignment: Left

Syntax

\texttt{NLDATMYQS}w.

Syntax Description

\texttt{w} specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 6

Range 4–200

Details

NLDATMYQS writes the date in a short-uniform pattern of the year and year’s quarter value using numbers and a delimiter, such as 2012/4.

Example

The following example uses the date April 16, 2019.

```
data _null_;   
dt = datetime();
dy = date();
put '+' NLDATMYQS min=4 default=6 max=200 +++' ;
put dt nldatmyqs.;
put dt nldatmyqs4.;
put dt nldatmyqs6.;
put dt nldatmyqs200.;
run;
```
NLDATMYRw. Format

  put dt nldatmyr200.;
run;

----- NLDATMYR min=2 default=16 max=200 ----+
  2019
  19
  2019
  2019
NLDATMYWw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the week number and the year.

Categories: CAS  
Date and Time

Alignment: Left

Syntax

**NLDATMYWw.**

Syntax Description

**w**

specifies the width of the output field.

Default 16

Range 5–200

Example

This example uses the en_US locale option, which is the default SAS session encoding.

```sas
data _null_;  
  dt = datetime();  
  dy = date();  
  put '++++ NLDATMYW min=5 default=16 max=200 ++++';  
  put ' 16' +5 dt nldatmyw.;  
  put '  5' +5 dt nldatmyw5.;  
  put '  8' +5 dt nldatmyw8.;  
  put ' 32' +5 dt nldatmyw32.;  
  put '200' +5 dt nldatmyw200.;  
run;
```

```
++++ NLDATMYW min=5 default=16 max=200 ++++
16  Week 16 2019
5  *****
8  W16 19
32  Week 16 2019
200  Week 16 2019
```
NLDATMZw. Format

Converts SAS datetime values to the locale-sensitive datetime string as datetime and time zone.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Left

**Syntax**

```
NLDATMZw.
```

**Syntax Description**

- `w` specifies the width of the output field.
  - **Default:** 40
  - **Range:** 16–200

**Example**

This example uses the current datetime value. This example specifies the fr_FR locale.

```plaintext
options locale=fr_FR;
data test;
x=datetime();
put x=nldatmz.;
run;
```

```
x=16 avril 2019 11 h 40 -0400
```

NLMNIAEDw.d Format

 Writes the monetary format of the international expression for the United Arab Emirates.

**Categories:**
- CAS
- Numeric

**Alignment:**
- Left

**Syntax**

```
NLMNIAEDw.d
```
Syntax Description

\textbf{w}

specifies the width of the output field.

Default: 12

Range: 8–32

\textbf{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Default: 3

Range: 0–28

Example

In the following example, the \texttt{LOCALE=} system option is set to \texttt{English\_UnitedStates}.

\begin{verbatim}
x=put(-1234.56789,nlmniaed32.2);
y=put(-1234.56789,dollar32.2);
\end{verbatim}

\begin{tabular}{|l|l|}

**Format:**

- "NLMNITHBw.d Format" on page 317

**NLMNLTRYw.d Format**

Writes the monetary format of the local expression for Turkey.
Syntax

**NLMNLTRY**\(w.d\)

**Syntax Description**

\(w\)
- specifies the width of the output field.
  - Default: 12
  - Range: 8–32

\(d\)
- specifies the number of digits to the right of the decimal point in the numeric value.
  - Default: 4
  - Range: 0–28

**Example**

In the following example, the LOCALE= system option is set to English_UnitedStates.

```plaintext
x=put(-1234.56789,nlmnltry32.2);
y=put(-1234.56789,dollar32.2);
```

---

**NLMNYw.d Format**

Writes the monetary format of the local expression in the specified locale using local currency.
Syntax

**NLMNYw.d**

Syntax Description

- **w**
  - Specifies the width of the output field.
  - Default: 9
  - Range: 1–32

- **d**
  - Specifies the number of digits to the right of the decimal point in the numeric value.
  - Default: 0
  - Range: 0–31

Details

The NLMNYw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLMNYw.d format writes numeric values by using the currency symbol, the thousands separator, and the decimal separator that is used by the locale.

**Note:** The NLMNYw.d format does not convert currency format. Therefore, the value of the formatted number should equal the currency of the current locale value.

Comparisons

The NLMNYw.d and NLMNYIw.d formats write the monetary format with locale-dependent thousands and decimal separators. However, the NLMNYIw.d format uses three-letter international currency codes, such as USD, while NLMNYw.d format uses local currency symbols, such as $.

The NLMNYw.d format is similar to the DOLLARw.d format except that the NLMNYw.d format is locale-specific.

Example

In the following example, the LOCATE= system option is set to English_UnitedStates.

```plaintext
x=put(-1234.56789,nlmny32.2);
y=put(-1234.56789,dollar32.2);
```
NLMNYIw.d Format

Writes the monetary format of the international expression in the specified locale.

Categories: CAS
            Numeric

Alignment: Left

Syntax

\texttt{NLMNYIw.d}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default 9

Range 1–32

\texttt{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Default 0

Range 0–31

See Also

Informats:
NLNUMw.d Format

Writes the numeric format of the local expression in the specified locale.

Categories:
- CAS
- Numeric

Alignment: Left

Syntax

NLNUMw.d

Syntax Description

w
- specifies the width of the output field.
  - Default: 6
  - Range: 1–32

d
- specifies to divide the number by $10^d$. If the data contains decimal separators, the $d$ value is ignored.
  - Default: 0
  - Range: 0–31

Details

The NLNUMw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLNUMw.d format writes numeric values by using the thousands separator and the decimal separator that is used by the locale.

Comparisons

The NLNUMw.d format writes the numeric value with locale-dependent thousand and decimal separators. The NLNUMIw.d format writes the numeric value with a comma (,) as thousands separator and a period (.) as a decimal separator.

If the $w$ or $d$ values are not large enough to generate a formatted number, the NLNUMw.d format uses an algorithm that prints the thousands-separator characters whenever possible, even if some decimal precision is lost.

Example

```r
x=put(-123456.7891,nlnum32.2);
```
NLNUMIw.d Format

Writes the numeric format of the international expression in the specified locale.

Syntax

\texttt{NLNUMIw.d}

Syntax Description

\textbullet \ w \text{ specifies the width of the output field.}

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>1–32</td>
</tr>
</tbody>
</table>

\textbullet \ d \text{ specifies to divide the number by } 10^d. \text{ If the data contains decimal points, the } d \text{ value is ignored.}
Details

The NLNUMIw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLNUMIw.d format writes numeric values by using a comma (,) as thousands separator and a period (.) as a decimal separator for all locales.

Comparisons

The NLNUMIw.d format writes the numeric data of the international expression in the specified locale. The NLNUMIw.d format writes the numeric value with a comma (,) as thousands separator and a period (.) as a decimal separator.

If the w or d values are not large enough to generate a formatted number, the NLNUMIw.d format uses an algorithm that prints the thousands-separator characters whenever possible, even if some decimal precision is lost.

Example

```plaintext
x=put(-1234356.7891,nlnumi32.2);
```

<table>

NLPCTw.d Format

Writes percentage data of the local expression in the specified locale.

Categories:
- CAS
- Numeric

Alignment: Left

Syntax

**NLPCT**\(w.d\)

Syntax Description

\(w\)
- specifies the width of the output field.
  - Default: 6
  - Range: 4–32

\(d\)
- specifies to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.
  - Default: 0
  - Range: 0–31

Comparisons

The NLPCT\(w.d\) format writes percentage data of the local expression in the specified locale. The NLPCT\(w.d\) format writes the percentage value with locale-dependent thousand and decimal separators. The NLPCTI\(w.d\) format writes the percentage value with a comma (,) as thousands separator and a period (.) as a decimal separator.

The NLPCT\(w.d\) format is similar to the PERCENT\(w.d\) format except the NLPCT\(w.d\) format is locale-specific.

Example

\[
x=\text{put}(-12.3456789, \text{nlpct32.2});
y=\text{put}(-12.3456789, \text{nlpcti32.2});
z=\text{put}(-12.3456789, \text{percent32.2});
\]

NLPCTIw.d Format

Writes percentage data of the international expression in the specified locale.

Categories: CAS
Numeric

Alignment: Left

Syntax

NLPCTIw.d

Syntax Description

w
specifies the width of the output field.

Default 6
Range 4–32
The NLPCTNw.d format produces percentages, using a minus sign for negative values.

### Example
In the following example, the LOCALE= system option is set to English UnitedStates.

\[ \text{x=put(-12.3456789,nlpcti32.2);} \]
\[ \text{y=put(-12.3456789,percent32.2);} \]

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>

</thead>
<tbody>
<tr>
<td>put x=;</td>
<td>-1,234.57%</td>
</tr>
<tr>
<td>put y=;</td>
<td>(1234.57)</td>
</tr>
</tbody>
</table>

### See Also

**Format:**
- "NLPCTw.d Format" on page 366

**Informats:**
Syntax

\texttt{NLPCTNw.d}

Syntax Description

\textbf{\texttt{w}}

specifies the width of the output field.

| Default | 6 |
| Range   | 4–32 |

\textbf{Tip}

The width of the output field must account for the minus sign (–), the percent sign (%), and a trailing blank, whether the number is negative or positive.

\textbf{\texttt{d}}

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

| Default | 0 |
| Range   | 0–31 |

| Requirement | must be less than \texttt{w} |

Details

The \texttt{NLPCTNw.d} format multiplies negative values by 100, adds a minus sign to the beginning of the value, and adds a percent sign (%) to the end of the formatted value.

Example

\begin{verbatim}
x=-0.02;
\end{verbatim}

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x nlpctn6.;</td>
<td>x=-2%</td>
</tr>
<tr>
<td>put x percentn6.;</td>
<td>x=-2%</td>
</tr>
</tbody>
</table>
NLPCTPw.d Format

Writes locale-specific numeric values as percentages.

**Syntax**

\[ \text{NLPCTP}w.d \]

**Syntax Description**

- **\( w \)**
  - Specifies the width of the output field.
  - **Default**: 6
  - **Range**: 4–32
  - **Tip**: The width of the output field must account for the percent sign (%).

- **\( d \)**
  - Specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional. The thousands separator and decimal symbol for the NLPCTP format is locale-specific.
  - **Default**: 0
  - **Range**: 0–31
  - **Requirement**: must be less than \( w \)

**Details**

The NLPCTPw.d format multiplies values by 100, formats them, and adds a percent sign (%) to the end of the formatted value. The NLPCTPw.d format is similar to the PERCENTw.d format except that the thousands separator and decimal symbol for the NLPCTPw.d format is locale-specific.

**Example**

\[ x=-0.02; \]

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x nlpctp6.;</td>
<td>-2%</td>
</tr>
</tbody>
</table>
NLPVALUEw.d Format

Writes p-values of the local expression in the specified locale.

Categories:
- CAS
- Numeric

Alignment:
- Left

Syntax

\texttt{NLPVALUE\textit{w.d}}

\textbf{Syntax Description}

\textit{w}

specifies the width of the output field.

\begin{itemize}
\item Default: 6
\item Range: 3–32
\end{itemize}

\textit{d}

specifies to divide the number by \(10^d\). If the data contains decimal separators, the \textit{d} value is ignored.

\begin{itemize}
\item Default: 4
\item Range: 1–30
\end{itemize}

\textbf{Example}

This example uses the german_Germany locale option.

\begin{verbatim}
Statements:
options locale=german_germany;
data _null_;
   put "+--- nlpvalue min=3 default=6 max=32 ----+";
   x=0.1248;
   put x= +5 x pvalue.   +5 x nlpvalue.;
   put x= +5 x pvalue3.1 +5 x nlpvalue3.1;
   put x= +5 x pvalue20.2 +5 x nlpvalue20.2;
   put x= +5 x pvalue32.3 +5 x nlpvalue32.3;
run;
\end{verbatim}

Results:

\begin{verbatim}
+--- nlpvalue min=3 default=6 max=32 ----+
x=0.1248  0.1248  0.1248
\end{verbatim}
See Also

Format:
- "PVALUEw.d Format" on page 395

NLSTRMONw.d Format
Writes the month name in the specified locale.

Categories: CAS
Numeric

Alignment: Left

Syntax

```
NLSTRMONw.d
```

Syntax Description

**w**
- specifies the width of the output field
  - Default: 20
  - Range: 1-200

**d**
- specifies the following:
  - 00000001: write abbreviated form.
  - 00000010: write capitalized form.
  - Default: 0
  - Range: 0-3

Details
The NLSTRMONw.d format writes a SAS value, 1–12 as the name-of-the-month in the specified locale. The following examples use the English_UnitedStates locale.

- 1 = the first month (January)
- 2 = the second month (February)
- 3 = the third month (March)
4 = the fourth month (April)
5 = the fifth month (May)
6 = the sixth month (June)
7 = the seventh month (July)
8 = the eight month (August)
9 = the ninth month (September)
10 = the 10th month (October)
11 = the 11th month (November)
12 = the 12th month (December)

Example
This example uses the English_UnitedStates session encoding.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data <em>null</em>; monnum = 1; /* January=1, December=12 */</td>
<td>January</td>
</tr>

<tr>
<td>put monnum NLSTRMON20.1; /* decimal .1 specified use abbreviation. */</td>
<td>JANUARY</td>
</tr>
<tr>
<td>put monnum NLSTRMON20.2;</td>
<td>JAN</td>
</tr>
<tr>
<td>put monnum NLSTRMON20.3;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**NLSTRQTRw.d Format**

Writes a numeric value as the quarter-of-the-year in the specified locale.

Categories: CAS
Numeric

Alignment: Left

**Syntax**

`NLSTRQTRw.d`

**Syntax Description**

`w`

specifies the width of the output field
Default 20
Range 1–200

d
specifies the following:
- 00000001: write abbreviated form.
- 00000010: write capitalized form.

Default 0
Range 0–3

Details
The NLSTRQTRw.d format writes a SAS value, 1–4 as the name-of-the-quarter for
the year in the specified locale. The following examples use the
English_UnitedStates locale.
- 1 = 1st quarter
- 2 = 2nd quarter
- 3 = 3rd quarter
- 4 = 4th quarter

Example
This example uses the English_UnitedStates session encoding.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data <em>null</em>;</td>
<td>1st quarter</td>

</tr>
<tr>
<td>put qtrnum NLSTRQTR20.3; run;</td>
<td></td>
</tr>
</tbody>
</table>

NLSTRWKw.d Format

Writes a numeric value as the day-of-the-week in the specified locale.

Categories: CAS
Numeric
Syntax

**NLSTRWK**\(w.d\)

Syntax Description

- \(w\)
  - Specifies the width of the output field
  - Default: 20
  - Range: 1–200

- \(d\)
  - Specifies the following:
    - 00000001: Write abbreviated form.
    - 00000010: Write capitalized form.
  - Default: 0
  - Range: 0–3

Details

The `NLSTRWKw.d` format writes a SAS value, 1–7 as the name-of-the-week in the specified locale. The following examples use the `English_UnitedStates` locale.

- 1 = First day-of-week (Monday)
- 2 = Second day-of-week (Tuesday)
- 3 = Third day-of-week (Wednesday)
- 4 = Fourth day-of-week (Thursday)
- 5 = Fifth day-of-week (Friday)
- 6 = Sixth day-of-week (Saturday)
- 7 = Seventh day-of-week (Sunday)

Example

This example uses the `English_UnitedStates` session encoding.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data <em>null</em>;</td>
<td>Sunday</td>
</tr>
<tr>
<td>wknum = 1; /* Sunday=1, Saturday=7 */</td>
<td>Sun</td>
</tr>
<tr>
<td>put wknum NLSTRWK20.;</td>
<td>SUNDAY</td>
</tr>
<tr>
<td>put wknum NLSTRWK20.1; /* decimal .1 specified use abbreviation. */</td>
<td>SUN</td>
</tr>
</tbody>
</table>
NLTIMAPw. Format

Converts a SAS time value to the time value of a specified locale, and then writes the value as a time value with a.m. or p.m. NLTIMAP also converts SAS date-time values.

Syntax

\texttt{NLTIMAPw.}

Syntax Description

- \texttt{w}
  - specifies the width of the output field.

  Default: 10
  
  Range: 4–200

Details

The NLTIMAP format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to \textit{Exceptions for Date and Time Default Widths} for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Comparisons

The \texttt{NLTIMAPw.} format is similar to the \texttt{TIMEAMPMw.} format except that the \texttt{NLTIMAPw.} format is locale-specific.

Example

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.
### Statements

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----------</td>
<td>---------</td>
</tr>
</tbody>
</table>

```sql
options locale=English_UnitedStates;
put time nltimap.;
4:24:43 PM

options locale=German_Germany;
put time nltimap14.;
4:24:43 nachm
```

### See Also

**Format:**

- “NLTIMEw. Format” on page 377

### NLTIMEw. Format

Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value. NLTIME also converts SAS date-time values.

**Categories:**

- CAS
- Date and Time

**Alignment:**

Left

#### Syntax

**NLTIMEw.**

#### Syntax Description

**w**

specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>10–200</td>
</tr>
</tbody>
</table>

#### Comparisons

The NLTIMEw. format is similar to the TIMEw. format except that the NLTIMEw. format is locale-specific.

#### Example

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.
NUMXw.d Format

Writes numeric values with a comma in place of the decimal point.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.
Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

\texttt{NUMXw.d}

Syntax Description

\texttt{w}

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>1–32</td>
</tr>
</tbody>
</table>

\texttt{d}

specifies the number of digits to the right of the decimal point (comma) in the numeric value. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0–31</td>
</tr>
</tbody>
</table>
Details

The NUMXw.d format writes numeric values with a comma in place of the decimal point.

Comparisons

The NUMXw.d format is similar to the w.d format except that NUMXw.d writes numeric values with a comma in place of the decimal point.

Example

```plaintext
data one;
  input x;
  datalines;
  896.48
  64.89
  3064.10
;
run;

data two;
  set one;
  put x numx10.2;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>896.48</td>
<td>896,48</td>
</tr>
<tr>
<td>64.89</td>
<td>64,89</td>
</tr>
<tr>
<td>3064.10</td>
<td>3064,10</td>
</tr>
</tbody>
</table>

**Informats:**
- "NUMXw.d Informat" on page 592

**OCTALw. Format**

Converts numeric values to octal representation.
Syntax

\texttt{OCTALw.}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default: 3
Range: 1–24

Details

If necessary, the OCTALw. format converts numeric values to integers before displaying them in octal representation.

Comparisons

OCTALw. converts numeric values to octal representation. The $OCTALw.$ format converts character values to octal representation.

Example

```plaintext
data one;
x=3592;
put x octal6.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>3592</td>
<td>007010</td>
</tr>
</tbody>
</table>

ODDSRw.d Format

Writes odds ratios.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

OOCSR\(w.d\)

Syntax Description

\(w\)

specifies the width of the output field.

Default \(8\)

Range \(2–32\)

\(d\)

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Default \(0\)

Range \(0–30\)

Requirement \(d\) must be less than \(w\).

Comparisons

The OODSR\(w.d\) format follows the rules for the \(w.d\) format, except in these conditions:

- values from \(-1\times10^{-d-2}–\text{eps}\) are displayed as less than “0.0...01”
- values that are greater than or equal to \(10^{w-d-2}\) are displayed as greater than “999.999”

Example

data one;
  input x;
  datalines;
  0.00001
  0.0001
  0.001
  0.01
  0.1
  1
  10
  100
  1000
  I
  _
  M
  .
  "1"
;
runc;
data two;
    set one;
    put x oddsr8.3;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00001</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>0.0001</td>
<td>&lt;0.001</td>
</tr>
<tr>
<td>0.001</td>
<td>0.001</td>
</tr>
<tr>
<td>0.01</td>
<td>0.010</td>
</tr>
<tr>
<td>0.1</td>
<td>0.100</td>
</tr>
<tr>

</tbody>
</table>

**PDw.d Format**

Writes data in packed decimal format.

**Category:** Numeric

**Alignment:** Left

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Interaction:** When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.
Syntax

PD\textsubscript{w}.\textsubscript{d}

Syntax Description

\textbf{w}

specifies the width of the output field. The \textit{w} value specifies the number of bytes, not the number of digits. (In packed decimal data, each byte contains two digits.)

Default: 1

Range: 1–16

\textbf{d}

specifies to multiply the number by 10\textsuperscript{d}. This argument is optional.

Default: 0

Range: 0–31

Details

Different operating environments store packed decimal values in different ways. However, the PD\textsubscript{w}.\textsubscript{d} format writes packed decimal values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

The PD\textsubscript{w}.\textsubscript{d} format writes missing numerical data as –0. When the PD\textsubscript{w}.\textsubscript{d} informat reads a –0, it stores it as 0.

Comparisons

The following table compares packed decimal notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>PD4.</td>
</tr>
<tr>
<td>COBOL</td>
<td>COMP-3 PIC S9(7)</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>PL4</td>
</tr>
<tr>
<td>PL/I</td>
<td>FIXED DEC</td>
</tr>
</tbody>
</table>
Example

data a;
  x=128;
  y=put(x,pd4.);
  put y $hex8.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>00000128</td>
</tr>
</tbody>
</table>

1  The result is a hexadecimal representation of a binary number written in packed decimal format. Each byte occupies one column of the output field.

PDJULGw. Format

Writers packed Julian date values in the hexadecimal format yyyydddF for IBM.

Category: Date and Time
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

PDJULGw.

Syntax Description

w
  specifies the width of the output field.
  Default  4
  Range    3–16

Details

The PDJULGw. format writes SAS date values in the form yyyydddF.

yyyy
  is the 2-byte representation of the four-digit Gregorian year.

ddd
  is the 1 1/2-byte representation of the three-digit integer that corresponds to the Julian day of the year, 1–365 (or 1–366 for leap years).

F
  is the half-byte that contains all binary 1s, which assigns the value as positive.
Note: SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

date = '15sep2018'd;
juldate = put(date,pdjulg4.);
put juldate $hex8.;
run;

SAS writes the following results to the log:

20182587F

PDJULIw. Format

Writes packed Julian date values in the hexadecimal format ccyydddF for IBM.

Category: Date and Time

Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

PDJULIw.
Syntax Description

\texttt{w}

specifies the width of the output field.

\textbf{Default} \hspace{1cm} \texttt{4}

\textbf{Range} \hspace{1cm} \texttt{3–16}

Details

The \texttt{PDJUL\texttt{w}.} format writes SAS date values in the form \texttt{ccyyddd\texttt{F}}.

\textit{cc}

is the 1-byte representation of a two-digit integer that represents the century.

\textit{yy}

is the 1-byte representation of a two-digit integer that represents the year. The \texttt{PDJUL\texttt{w}.} format makes an adjustment for the century byte by subtracting 1900 from the four-digit Gregorian year to produce the correct packed decimal \texttt{ccyy} representation. A year value of 1998 is stored in \texttt{ccyy} as 0098, and a year value of 2011 is stored as 0111.

\textit{ddd}

is the 1 1/2-byte representation of the three-digit integer that corresponds to the Julian day of the year, 1–365 (or 1–366 for leap years).

\textit{F}

is the half-byte that contains all binary 1s, which assigns the value as positive.

\begin{quote}
\textbf{Note:} SAS interprets a two-digit year as part of the 100-year span that is defined by the \texttt{YEARCUTOFF=} system option.
\end{quote}

Examples:

Example 1

```plaintext
data _null_
   ;
   date = '15jun2018'd;
   juldate = put(date,pdjuli4.);
   put juldate $hex8.;
run;
```

SAS writes the following results to the log:

\begin{verbatim}
0118258F
\end{verbatim}

Example 2

```plaintext
data _null_
   ;
   date = '31dec2018'd;
   juldate = put(date,pdjuli4.);
   put juldate $hex8.;
run;
```

SAS writes the following results to the log:

PERCENTw.d Format

Writes numeric values as percentages.

Categories: CAS

Numeric

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

PERCENTw.d

Syntax Description

w

specifies the width of the output field.

Default 6

Range 4–32
Tip: The width of the output field must account for the percent sign (%) and parentheses for numbers, whether the number is negative or positive.

\( d \)

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

- **Range:** 0–31
- **Requirement:** must be less than \( w \)

Details

The PERCENT\( w.d \) format multiplies values by 100, formats them the same as the BEST\( w.d \) format, and adds a percent sign (%) to the end of the formatted value. Negative values are enclosed in parentheses.

Example

```plaintext
data one;
  input gain;
  datalines;
  .1
  1.2
  -0.05
;
run;

data two;
  set one;
  put @10 gain percent10.;
run;
```

<table>
<thead>
<tr>
<th>Value of gain</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1</td>
<td>10%</td>
</tr>
<tr>
<td>1.2</td>
<td>120%</td>
</tr>
<tr>
<td>-0.05</td>
<td>(5%)</td>
</tr>
</tbody>
</table>

See Also

- **Formats:**
  - "PERCENTNw.d Format" on page 389
PERCENTNw.d Format

Produces percentages, using a minus sign for negative values.

Categories:
- CAS
- Numeric

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

PERCENTNw.d

Syntax Description

w specifies the width of the output field.

Default 6

Range 4–32

Tip The width of the output field must account for the minus sign ( – ), the percent sign ( % ), and a trailing blank, whether the number is negative or positive.

d specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Range 0–31

Requirement must be less than w

Details

The PERCENTNw.d format multiplies negative values by 100, formats them the same as the BESTw.d format, adds a minus sign to the beginning of the value, and adds a percent sign (%) to the end of the formatted value.

Comparisons

The PERCENTNw.d format produces percents by using a minus sign instead of parentheses for negative values. The PERCENTw.d format produces percents by using parentheses for negative values.
Example

```sas
data one;
    input gain;
    datalines;
    -0.1
    0.2
    .8
    -0.05
    -6.3
;
run;

data two;
    set one;
    put @10 gain percentn10.;
run;
```

<table>
<thead>
<tr>
<th>Value of gain</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-0.1</td>
<td>-10%</td>
</tr>
<tr>
<td>.2</td>
<td>20%</td>
</tr>
<tr>
<td>.8</td>
<td>80%</td>
</tr>
<tr>
<td>-0.05</td>
<td>-5%</td>
</tr>
<tr>
<td>-6.3</td>
<td>-630%</td>
</tr>
</tbody>
</table>

See Also

**Format:**

**PIBw.d Format**

 Writes positive integer binary (fixed-point) values.

*Category:* Numeric  
*Alignment:* Left  
*Restriction:* This format is not supported in a DATA step that runs in CAS.

*See:*  
- "PIB Format: UNIX" in SAS Companion for UNIX Environments  
- "PIBw.d Format: Windows" in SAS Companion for Windows
Syntax

PIBw.d

Syntax Description

w
specifies the width of the output field.

Default 1
Range 1–8

d
specifies to multiply the number by $10^d$. This argument is optional.

Default 0
Range 0–10

Details

All values are treated as positive. PIBw.d writes positive integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Note: Different operating environments store integer binary values in different ways. This concept is called byte ordering. For more information about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 35.

Comparisons

- Positive integer binary values are the same as integer binary values except that the sign bit is part of the value, which is always a positive integer. The PIBw.d format treats all values as positive and includes the sign bit as part of the value.

- The PIBw.d format with a width of 1 results in a value that corresponds to the binary equivalent of the contents of a byte. A value that corresponds to the binary equivalent of the contents of a byte is useful if your data contains values between hexadecimal 80 and hexadecimal FF, where the high-order bit can be misinterpreted as a negative sign.

- The PIBw.d format is the same as the IBw.d format except that PIBw.d treats all values as positive values.

- The IBw.d and PIBw.d formats are used to write native format integers. (Native format enables you to read and write values that are created in the same operating environment.) The IBRw.d and PIBRw.d formats are used to write little endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see “Writing Data Generated on Big Endian and Little Endian Platforms” on page 35.
To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

```plaintext
data _null_;  
x=12;  
y=put(x,pib1.);  
put y $hex2.;  
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>------+----1</td>
</tr>
<tr>
<td>12</td>
<td>0C</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a 1-byte binary number written in positive integer binary format, which occupies one column of the output field.

See Also

Formats:

- "PIBRw.d Format" on page 392

PIBRw.d Format

Writes positive integer binary (fixed-point) values in Intel and DEC formats.

Category: Numeric

Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

```
PIBRw.d
```

Syntax Description

- **w**
  
  specifies the width of the input field.
  
  Default 1
  
  Range 1–8

- **d**

  specifies to multiply the number by $10^d$. This argument is optional.
Details

All values are treated as positive. PIBRw.d writes positive integer binary values that have been generated by and for Intel and DEC operating environments. Use PIBRw.d to write positive integer binary data from Intel or DEC environments in other operating environments. The PIBRw.d format in SAS code allows for a portable implementation for writing the data in any operating environment.

Note: Different operating environments store positive integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 35.

Comparisons

- Positive integer binary values are the same as integer binary values except that the sign bit is part of the value, which is always a positive integer. The PIBRw.d format treats all values as positive and includes the sign bit as part of the value.

- The PIBRw.d format with a width of 1 results in a value that corresponds to the binary equivalent of the contents of a byte. A value that corresponds to the binary equivalent of the contents of a byte is useful if your data contains values between hexadecimal 80 and hexadecimal FF, where the high-order bit can be misinterpreted as a negative sign.

- In Intel and DEC operating environments, the IBw.d and PIBRw.d formats are equivalent.

- The IBw.d and PIBw.d formats are used to write native format integers. (Native format enables you to read and write values that are created in the same operating environment.) The IBw.d and PIBRw.d formats are used to write little endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see “Writing Data Generated on Big Endian and Little Endian Platforms” on page 35.

To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

data _null_
  x=128;
  y=put(x,pibr2.);
  put y $hex4.;
run;
The result is a hexadecimal representation of a two-byte binary number written in positive integer binary format, which occupies one column of the output field.

See Also

Informats:
- "PIBw.d Informat" on page 601

PKw.d Format

Writes data in unsigned packed decimal format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

\( PKw.d \)

Syntax Description

\( w \)

specifies the width of the output field.

Default: 1
Range: 1–16

\( d \)

specifies to multiply the number by \(10^d\). This argument is optional.

Default: 0
Range: 0–10
Requirement: must be less than \( w \)
Details
Each byte of unsigned packed decimal data contains two digits.

Comparisons
The PKw.d format is similar to the PDw.d format except that PKw.d does not write the sign in the low-order byte.

Example
```sas
data _null_;  
x=128;  
y=put(x,pk4.);  
put y $hex8.;  
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>00000128</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a 4-byte number written in packed decimal format. Each byte occupies one column of the output field.

**PVALUEw.d Format**

Writes p-values.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.
Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

**Syntax**

```
PVALUEw.d
```

**Syntax Description**

`w`

specifies the width of the output field.

Default 6

Range 3–32
\(d\)

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

- **Default**: the minimum of 4 and \(w-2\)
- **Range**: 1–30
- **Requirement**: \(d\) must be less than \(w\).

### Comparisons

The PVALUE\(w, d\) format follows the rules for the \(w, d\) format, except in these conditions:

- if the value \(x\) is such that \(0 \leq x < 10^{-d}\), \(x\) is printed as “\(<.0...01\)” with \(d-1\) zeros
- missing values are printed as “.” unless you specify a different character by using the MISSING= system option

### Example

```r
data one;
  input x;
datalines;
  .05
  .000001
  0
  .0123456
;run;

data two;
  set one;
  put x pvalue6.4;
run;
```

<table>
<thead>
<tr>
<th>Value of (x)</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>.05</td>
<td>0.0500</td>
</tr>
<tr>
<td>0.000001</td>
<td>(&lt;.0001)</td>
</tr>
<tr>
<td>0</td>
<td>(&lt;.0001)</td>
</tr>
<tr>
<td>.0123456</td>
<td>0.0123</td>
</tr>
</tbody>
</table>

396 Chapter 2 / Dictionary of Formats
QTRw. Format

Writes date values as the quarter of the year.

Categories:
- CAS
- Date and Time

Alignment: Right

Syntax

QTRw.

Syntax Description

w

specifies the width of the output field.

Default: 1

Range: 1–32

Example

```sas
data one;
  x='05mar2018'd;
  put x qtr.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x qtr.;</td>
<td>l</td>
</tr>
</tbody>
</table>

See Also

Formats:
- “QTRRw. Format” on page 397

---

QTRRw. Format

Writes date values as the quarter of the year in Roman numerals.

Categories: CAS
Syntax

**QTRR**\(w\).

Syntax Description

\(w\)

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>3–32</td>
</tr>
</tbody>
</table>

Example

```sas
data one;
x='05sep2018'd;
put x qtrr.;
run;
```

The example table uses the input value of 21432, which is the SAS date value that corresponds to September 5, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x qtrr.;</td>
<td>III</td>
</tr>
</tbody>
</table>

See Also

**Formats:**

- “QTRw. Format” on page 397

**RBw.d Format**

Writes real binary data (floating-point) in real binary format.

Category: Numeric

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.

See:

- “RB Format: UNIX” in SAS Companion for UNIX Environments
- “RBw.d Format: Windows” in SAS Companion for Windows
"RBw.d Format: z/OS" in SAS Companion for z/OS

Syntax

**RBw.d**

Syntax Description

w

specifies the width of the output field.

Default 4

Range 2–8

d

specifies to multiply the number by $10^d$. This argument is optional.

Default 0

Range 0–10

Details

The RBw.d format writes numeric data in the same way that SAS stores the data. Because it requires no data conversion, RBw.d is the most efficient method for writing data with SAS.

---

**Note:** Different operating environments store real binary values in different ways. However, RBw.d writes real binary values with consistent results in the same type of operating environment that you use to run SAS.

---

**CAUTION**

Using RB4 to write real binary data on equipment that conforms to the IEEE standard for floating-point numbers results in a truncated 8-byte (double-precision) number rather than a true 4-byte (single-precision) floating-point number.

---

Comparisons

The following table compares the names of real binary notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>4 Bytes</th>
<th>8 Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>RB4.</td>
<td>RB8.</td>
</tr>
<tr>
<td>Fortran</td>
<td>REAL*4</td>
<td>REAL*8</td>
</tr>
<tr>
<td>C</td>
<td>float</td>
<td>double</td>
</tr>
<tr>
<td>Language</td>
<td>4 Bytes</td>
<td>8 Bytes</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>COBOL</td>
<td>COMP-1</td>
<td>COMP-2</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>E</td>
<td>D</td>
</tr>
</tbody>
</table>

Example

```
data one;
x=128;
y=put(x,rb8.);
put y $hex16.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result ¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>000000000006040</td>
</tr>
</tbody>
</table>

¹ The result is a hexadecimal representation of an 8-byte real binary number as it looks on an IBM mainframe. Each byte occupies one column of the output field.

**ROMANw. Format**

Writes numeric values as Roman numerals.

**Categories:** CAS

**Numeric**

**Alignment:** Left

**Syntax**

`ROMANw.`

**Syntax Description**

w

specifies the width of the output field.

**Default** 6

**Range** 2–32

**Details**

The ROMANw. format truncates a floating-point value to its integer component before the value is written.
Example

data one;
  input x;
datalines;
  2018
  52.3
;
run;
data two;
  set one;
  put x roman10.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2018</td>
<td>MMXVIII</td>
</tr>
<tr>
<td>52.3</td>
<td>LII</td>
</tr>
</tbody>
</table>

S370FFw.d Format

Writes native standard numeric data in IBM mainframe format.

Category:   Numeric
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

```
S370FFw.d
```

Syntax Description

**w**

specifies the width of the output field.

- Default: 12
- Range: 1–32

**d**

specifies the power of 10 by which to divide the value. This argument is optional.

- Range: 0–31
Details

The S370FFw.d format writes numeric data in IBM mainframe format (EBCDIC). The EBCDIC numeric values are represented with 1 byte per digit. If EBCDIC is the native format, S370FFw.d performs no conversion.

If a value is negative, an EBCDIC minus sign precedes the value. A missing value is represented as a single EBCDIC period.

Comparisons

- On an EBCDIC system, S370FFw.d behaves like the w.d format.
- On all other systems, S370FFw.d performs the same role for numeric data that the $EBCDICw. format does for character data.

Example

```r
data _null_;  
x=12345;  
y=put(x,s370ff5.);  
put y $hex10.;  
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>12345</td>
<td>F1F2F3F4F5</td>
</tr>
</tbody>
</table>

1  The result is the hexadecimal representation for the integer.

- "w.d Format" on page 429

S370FIBw.d Format

Writes integer binary (fixed-point) values, including negative values, in IBM mainframe format.

Category:  Numeric
Alignment:  Left

Syntax

S370FIBw.d
Syntax Description

\( w \) specifies the width of the output field.

- Default: 4
- Range: 1–8

\( d \) specifies to multiply the number by \(10^d\). This argument is optional.

- Default: 0
- Range: 0–10

Details

The S370FIBw.d format writes integer binary (fixed-point) values that are stored in IBM mainframe format, including negative values that are represented in two's-complement notation. S370FIBw.d writes integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Use S370FIBw.d to write integer binary data in IBM mainframe format from data that is created in other operating environments.

**Note:** Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms" on page 35.

Comparisons

- If you use SAS on an IBM mainframe, S370FIBw.d and IBw.d are identical.
- S370FPIBw.d, S370FIBUw.d, and S370FIBw.d are used to write big endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see "Writing Data Generated on Big Endian and Little Endian Platforms" on page 35.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

Example

```plaintext
data _null_;  
x=128;  
y=put(x,s370fib4.);  
put y $hex8.;  
run;
```
### Value of x Result

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>00000080</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a 4-byte integer binary number. Each byte occupies one column of the output field.

### See Also

**Formats:**
- “S370FIBUw.d Format” on page 404
- “S370FPIBw.d Format” on page 409

### S370FIBUw.d Format

Writes unsigned integer binary (fixed-point) values in IBM mainframe format.

- **Category:** Numeric
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

### Syntax

**S370FIBUw.d**

### Syntax Description

- **w**
  - Specifies the width of the output field.
  - **Default:** 4
  - **Range:** 1–8

- **d**
  - Specifies to multiply the number by $10^d$. This argument is optional.
  - **Default:** 0
  - **Range:** 0–10

### Details

The S370FIBUw.d format writes unsigned integer binary (fixed-point) values that are stored in IBM mainframe format, including negative values that are represented in two's-complement notation. Unsigned integer binary values are the same as integer
binary values, except that all values are treated as positive. S370FIBUw.d writes integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Use S370FIBUw.d to write unsigned integer binary data in IBM mainframe format from data that is created in other operating environments.

Note: Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 35.

Comparisons

- The S370FIBUw.d format is equivalent to the COBOL notation PIC 9(n) BINARY, where \( n \) is the number of digits.

- The S370FIBUw.d format is the same as the S370FIBw.d format except that the S370FIBUw.d format always uses the absolute value instead of the signed value.

- The S370FP1Bw.d format writes all negative numbers as FFs, whereas the S370FIBUw.d format writes the absolute value.

- S370FP1Bw.d, S370FIBUw.d, and S370FIBw.d are used to write big endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see “Writing Data Generated on Big Endian and Little Endian Platforms” on page 35.

To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

```plaintext
data one;
  input x;
  datalines;
245
-245
; run;

data two;
  set one;
  y=put(x,s370fibu2.);
  put y $hex4.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result ¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>245</td>
<td>F5</td>
</tr>
</tbody>
</table>

¹ Use of $hex4. format to display the hexadecimal representation.
The result is a hexadecimal representation of a 1-byte integer binary number. Each byte occupies one column of the output field.

S370FPDw.d Format

Writes packed decimal data in IBM mainframe format.

Category: Numeric

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

S370FPD<width>.<decimal>  

Syntax Description

<width>
  specifies the width of the output field.

  Default 1
  Range 1–16

<decimal>
  specifies to multiply the number by \(10^d\). This argument is optional.

  Default 0
  Range 0–31

Details

Use S370FPD<width>.<decimal> in other operating environments to write packed decimal data in the same format as on an IBM mainframe computer.
Comparisons

The following table shows the notation for equivalent packed decimal formats in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Packed Decimal Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>S370FPD4.</td>

</tr>
<tr>
<td>COBOL</td>
<td>COMP-3 PIC S9(7)</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>PL4</td>
</tr>
</tbody>
</table>

Example

```plaintext
data _null_;  
x=128;  
y=put(x,s370fpd4.);  
put y $hex8.;  
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>0000128C</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a binary number written in packed decimal format. Each byte occupies one column of the output field.

S370FPDUw.d Format

Writes unsigned packed decimal data in IBM mainframe format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

S370FPDUw.d
Syntax Description

\[ w \]

specifies the width of the output field.

Default: 1
Range: 1–16

\[ d \]

specifies to multiply the number by \(10^d\). This argument is optional.

Default: 0
Range: 0–31

Details

Use S370FPDUw.d in other operating environments to write unsigned packed decimal data in the same format as on an IBM mainframe computer.

Comparisons

- The S370FPDUw.d format is similar to the S370FPDw.d format except that the S370FPDw.d format always uses the absolute value instead of the signed value.
- The S370FPDUw.d format is equivalent to the COBOL notation PIC 9(n) PACKED-DECIMAL, where \(n\) is the number of digits.

Example

```plaintext
data one;
   input x;
   datalines;
   123
   -123
;
run;
data two;
   set one;
   y=put(x,s370fpdu4.);
   put y $hex8.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result ¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>123F</td>
</tr>
<tr>
<td>-123</td>
<td>123F</td>
</tr>
</tbody>
</table>

¹ The result is a hexadecimal representation of a binary number written in packed decimal format. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.
S370FPIBw.d Format

Writes positive integer binary (fixed-point) values in IBM mainframe format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

S370FPIBw.d

Syntax Description

w
specifies the width of the output field.

Default 4
Range 1–8

d
specifies to multiply the number by 10^d. This argument is optional.

Default 0
Range 0–10

Details

Positive integer binary values are the same as integer binary values, except that all values are treated as positive. S370FPIBw.d writes integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Use S370FPIBw.d to write positive integer binary data in IBM mainframe format from data that is created in other operating environments.

Note: Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms" on page 35.

Comparisons

- If you use SAS on an IBM mainframe, S370FPIBw.d and PIBw.d are identical.
- The S370FPIBw.d format is the same as the S370FIBw.d format except that the S370FPIBw.d format treats all values as positive values.
S370FPIBw.d, S370FIBUw.d, and S370FIBw.d are used to write big endian integers in any operating environment.

To view a table that shows the type of format to use with big endian and little endian integers, see “Writing Data Generated on Big Endian and Little Endian Platforms” on page 35.

To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

```plaintext
data _null_;  
x=12;  
y=put(x,s370fpib1.);  
put y $hex2.;  
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>----+----</td>
</tr>
<tr>
<td>12</td>
<td>0C</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a 1-byte binary number written in positive integer binary format, which occupies one column of the output field.

S370FRBw.d Format

Writes real binary (floating-point) data in IBM mainframe format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

```
S370FRBw.d
```
Syntax Description

\( w \)

specifies the width of the output field.

Default: 4

Range: 2–8

\( d \)

specifies to multiply the number by \(10^d\). This argument is optional.

Default: 0

Range: 0–10

Details

A floating-point value consists of two parts: a mantissa that gives the value and an exponent that gives the value's magnitude.

Use S370FRB\(w.d\) in other operating environments to write floating-point binary data in the same format as on an IBM mainframe computer.

Comparisons

The following table shows the notation for equivalent floating-point formats in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>4 Bytes</th>
<th>8 Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>PL/I</td>
<td>FLOAT BIN(21)</td>

<td>COMP-2</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>E</td>
<td>D</td>
</tr>
<tr>
<td>C</td>
<td>float</td>
<td>double</td>
</tr>
</tbody>
</table>

Example

data _null_
    input x;
    y=put(x,s370frb6.);
    put y $hex8.;
    datalines;
128
-128
;

S370FRBw.d Format 411
The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.

S370FZDw.d Format

 Writes zoned decimal data in IBM mainframe format.

| Category: | Numeric |
| Alignment: | Left |
| Restriction: | This format is not supported in a DATA step that runs in CAS. |
| Interaction: | When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference. |

Syntax

\[ S370FZDw.d \]

Syntax Description

\[ w \]

specifies the width of the output field.

Default \( 8 \)

Range \( 1–32 \)

\[ d \]

specifies to multiply the number by \( 10^d \). This argument is optional.

Default \( 0 \)

Range \( 0–31 \)

Details

Use S370FZDw.d in other operating environments to write zoned decimal data in the same format as on an IBM mainframe computer.
Comparisons

The following table shows the notation for equivalent zoned decimal formats in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Zoned Decimal Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>S370FZD3.</td>
</tr>
<tr>
<td>PL/I</td>
<td>PICTURE '99T'</td>
</tr>
<tr>
<td>COBOL</td>
<td>PIC S9(3) DISPLAY</td>
</tr>
<tr>
<td>assembler</td>
<td>ZL3</td>
</tr>
</tbody>
</table>

Example

```plaintext
data one;
  input x;
datalines;
  123
  -123
;
run;
data two;
  set one;
  y=put(x,s370fzd3.);
  put y $hex6.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result ¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>F1F2C3</td>
</tr>
<tr>
<td>-123</td>
<td>F1F2D3</td>
</tr>
</tbody>
</table>

¹ The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.

S370FZDLw.d Format

Writes zoned decimal leading-sign data in IBM mainframe format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

S370FZDLw.d

Syntax Description

w

specifies the width of the output field.

Default 8
Range 1–32

d

specifies to multiply the number by $10^d$. This argument is optional.

Default 0
Range 0–31

Details

Use S370FZDLw.d in other operating environments to write zoned decimal leading-sign data in the same format as on an IBM mainframe computer.

Comparisons

- The S370FZDLw.d format is similar to the S370FZDw.d format except that the S370FZDLw.d format displays the sign of the number in the first byte of the formatted output.
- The S370FZDLw.d format is equivalent to the COBOL notation PIC S9(n) DISPLAY SIGN LEADING, where n is the number of digits.

Example

```sas
data one;
  input x;
  datalines;
  123
 -123
 ;
run;

data two;
  set one;
  y=put(x,s370fzdl3.);
  put y $hex6.;
run;
```
### Table

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>C1F2F3</td>
</tr>
<tr>
<td>-123</td>
<td>D1F2F3</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.

### S370FZDSw.d Format

Writes zoned decimal separate leading-sign data in IBM mainframe format.

- **Category:** Numeric
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

#### Syntax

**S370FZDSw.d**

#### Syntax Description

- **w**
  - Specifies the width of the output field.
  - **Default:** 8
  - **Range:** 2–32

- **d**
  - Specifies to multiply the number by 10\(^d\). This argument is optional.
  - **Default:** 0
  - **Range:** 0–31

#### Details

Use S370FZDSw.d in other operating environments to write zoned decimal separate leading-sign data in the same format as on an IBM mainframe computer.

#### Comparisons

- The S370FZDSw.d format is similar to the S370FZDLw.d format except that the S370FZDSw.d format does not embed the sign of the number in the zoned output.
The S370FZDSw.d format is equivalent to the COBOL notation PIC S9(n) DISPLAY SIGN LEADING SEPARATE, where n is the number of digits.

Example

data one;
  input x;
  datalines;
  123
  -123
;
run;
data two;
set one;
y=put(x,s370fzds3.);
put y $hex6.;
run;

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>4EF1F2F3</td>
</tr>
<tr>
<td>-123</td>
<td>60F1F2F3</td>
</tr>
</tbody>
</table>

The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.

S370FZDTw.d Format

Writes zoned decimal separate trailing-sign data in IBM mainframe format.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

S370FZDTw.d

Syntax Description

w
  specifies the width of the output field.

Default 8
Range 2–32

\( d \) specifies to multiply the number by \( 10^d \). This argument is optional.

Default 0

Range 0–31

Details

Use S370FZDT\( w,d \) in other operating environments to write zoned decimal separate trailing-sign data in the same format as on an IBM mainframe computer.

Comparisons

- The S370FZDT\( w,d \) format is similar to the S370FZDS\( w,d \) format except that the S370FZDT\( w,d \) format displays the sign of the number at the end of the formatted output.
- The S370FZDT\( w,d \) format is equivalent to the COBOL notation PIC S9(\( n \)) DISPLAY SIGN TRAILING SEPARATE, where \( n \) is the number of digits.

Example

```plaintext
data one;
   input x;
datalines;
  123
-123
;
run;
data two;
   set one;
y=put(x,s370fzdt4.);
   put y $hex8.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>F1F2F34E</td>
</tr>
<tr>
<td>-123</td>
<td>F1F2F360</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the output field.

S370FZDU\( w,d \) Format

Writes unsigned zoned decimal data in IBM mainframe format.
Syntax

\texttt{S370FZDUw.d}

Syntax Description

\textbf{w}

specifies the width of the output field.

- Default: 8
- Range: 1–32

\textbf{d}

specifies to multiply the number by $10^d$. This argument is optional.

- Default: 0
- Range: 0–31

Details

Use \texttt{S370FZDUw.d} in other operating environments to write unsigned zoned decimal data in the same format as on an IBM mainframe computer.

Comparisons

- The \texttt{S370FZDUw.d} format is similar to the \texttt{S370FZDw.d} format, except that the \texttt{S370FZDUw.d} format always uses the absolute value of the number.
- The \texttt{S370FZDUw.d} format is equivalent to the COBOL notation \texttt{PIC 9(n) DISPLAY}, where \textit{n} is the number of digits.

Example

```sas
data one;
  input x;
datalines;
  123
  -123
; run;
data two;
  set one;
y=put(x,s370fzdu3.);
put y $hex6.;
```
The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each pair of hexadecimal characters (such as F1) corresponds to 1 byte of binary data, and each byte corresponds to one column of the output field.

SSNw. Format

Writes Social Security numbers.

Category: Numeric

Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

SSNw.

Syntax Description

w

specifies the width of the output field.

Default 11

Restriction w must be 11

Details

If the value is missing, SAS writes nine single periods with hyphens between the third and fourth periods and between the fifth and sixth periods. If the value contains fewer than nine digits, SAS right-aligns the value and pads it with zeros on the left. If the value has more than nine digits, SAS writes it as a missing value.

Example

```sas
data one;
id=263878439;
put id ssn.;
run;
```

<table>
<thead>
<tr>
<th>Value of id</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>263878439</td>
<td>263–87–8439</td>
</tr>
</tbody>
</table>
TIMEw.d Format

Writes time values as hours, minutes, and seconds in the form hh:mm:ss.ss.

Categories: 
- CAS
- Date and Time

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Note: The value of TIME can be a SAS time value, but it can also represent a time duration. Therefore, the value of TIME can exceed 23:59:59, and it can also be a negative value.

Syntax

TIMEw.d

Syntax Description

w
- specifies the width of the output field.

Default 8
Range 2–20
Tip Make w large enough to produce the desired results. To obtain a complete time value with three decimal places, you must allow at least 12 spaces: eight spaces to the left of the decimal point, one space for the decimal point, and three spaces for the decimal fraction of seconds.

d
- specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0
Range 0–19
Requirement must be less than w

Details

The TIMEw.d format writes SAS time values in the form hh:mm:ss.ss:

hh
- is an integer.
**Note:** If *hh* is a single digit, **TIMEw.d** places a leading blank before the digit. For example, the **TIMEw.d** format writes 9:00 instead of 09:00.

**mm**
is an integer between 00 and 59 that represents minutes.

**ss.ss**
is the number of seconds between 00 and 59, with the fraction of a second following the decimal point.

**Comparisons**
The **TIMEw.d** format is similar to the **HHMMw.d** format except that **TIMEw.d** includes seconds.
The **TIMEw.d** format writes a leading blank for a single-hour digit. The **TODw.d** format writes a leading 0 for a single-hour digit.

**Examples:**

**Example 1**
```sas
data one;
    mytime='16:24:43't;
    put mytime time.;
run;
```
This example uses the input value of 59083, which is the SAS time value that corresponds to 4:24:43 p.m.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mytime time.;</td>
<td>16:24:43</td>
</tr>
</tbody>
</table>

**Example 2**
```sas
data one;
    mytime='8:00:00't *3;
    put mytime time.;
run;
```
This example uses the input value of '8:00:00't and a multiplier of 3 for the total (*3;*), which indicates that the total time duration (such as 3 days of work) is 24 hours.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mytime time.;</td>
<td>24:00:00</td>
</tr>
</tbody>
</table>
Example 3

data one;
  x='4:00:00't;
  y='3:00:00't;
  diff=y-x;
  put diff time.;
run;

This example uses the input values of x='4:00:00't and y='3:00:00't and determines that the value of y is one hour less than the value of x (diff = y-x;).

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put diff time8.;</td>
<td>-1:00:00</td>
</tr>
</tbody>
</table>

TIMEAMPMw.d Format

Writes time and datetime values as hours, minutes, and seconds in the form hh:mm:ss.ss with AM or PM.

Categories: CAS
Date and Time

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.
Syntax

**TIMEAMPMw.d**

Syntax Description

- **w** specifies the width of the output field.
  - Default: 11
  - Range: 2–20

- **d** specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.
  - Default: 0
  - Range: 0–19
  - Requirement: must be less than **w**

Details

The `TIMEAMPMw.d` format writes SAS time values and SAS datetime values in the form `hh:mm:ss.ss` with AM or PM. The letters h, m, and s are defined as follows:

- **hh** is an integer that represents the hour.
- **mm** is an integer that represents the minutes.
- **ss.ss** is the number of seconds to two decimal places.

Times greater than 23:59:59 PM appear as the next day.

Make `w` large enough to produce the desired results. To obtain a complete time value with three decimal places and AM or PM, you must allow at least 11 spaces (`hh:mm:ss PM`). If `w` is less than 5, SAS writes AM or PM only.

Comparisons

- The `TIMEAMPMw.d` format is similar to the `TIMEw.d` format, except that `TIMEAMPMw.d` prints AM or PM at the end of the time.
- `TIMEw.d` writes hours greater than 23:59:59 PM, and `TIMEAMPMw.d` does not.

Example

```plaintext
data one;
  begin='16:24:43't;
  put begin timeampm3.;
  put begin timeampm5.;
```
The example table uses the input value of 59083, which is the SAS time value that corresponds to 4:24:43 p.m.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put begin timeampm8.;</td>
<td>PM</td>
</tr>
<tr>
<td>put begin timeampm5.;</td>
<td>4 PM</td>
</tr>
<tr>
<td>put begin timeampm8.;</td>
<td>4:24 PM</td>
</tr>
<tr>
<td>put begin timeampm11.;</td>
<td>4:24:43 PM</td>
</tr>
</tbody>
</table>

See Also

Formats:
- "TIMEw.d Format" on page 420

TODw.d Format

Writes SAS time values and the time portion of SAS datetime values in the form hh:mm:ss.ss.

Categories: CAS
Date and Time

Alignment: Right

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Note: You can specify a value greater than 24:00:00 for the TOD format, but it takes the MOD of the value and 24:00:00. For example, if you give TOD a value of '25:00:00', it formats the value as 1:00:00.

Syntax

\text{TOD}w.d

Syntax Description

\text{w} specifies the width of the output field.
**Default** 8

**Range** 2–20

**Tip** SAS writes a 0 for a zero hour if the specified width is sufficient. For example, the times 02:30 or 00:30 have a zero in the hour digits.

**d** specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Range</strong></td>
<td>0–19</td>
</tr>
<tr>
<td><strong>Requirement</strong></td>
<td>(d) must be less than (w).</td>
</tr>
</tbody>
</table>

**Details**

The **TOD\(w.d\)** format writes SAS time and datetime values in the form \(hh:mm:ss.ss\).

**hh** is an integer that represents the hour.

**mm** is an integer that represents the minutes.

**ss.ss** is the number of seconds to two decimal places.

**Comparisons**

The **TOD\(w.d\)** format writes a leading zero for a single-hour digit. The **TIME\(w.d\)** format and the **HHMM\(w.d\)** format write a leading blank for a single-hour digit.

**Examples:**

**Example 1**

```sas
data one;
  mydt1='24aug2018 2:20:23 pm'dt;
  mydt2='1:30't;
  mydt3='8:54:43 am't;
  put mydt1 tod5.;
  put mydt2 tod9.;
  put mydt3 tod9.;
run;
```

In this example, the SAS datetime value 1850739623 corresponds to August 24, 2018 at 2:20:23 p.m.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydt1 tod5.;</td>
<td>14:20</td>
</tr>
</tbody>
</table>
SAS Statement | Result
--- | ---
put mydt2 tod9.; | 01:30:00
put mydt3 tod9.; | 08:54:43

Example 2
In this example, the SAS time value 32083 corresponds to 8:54:43 a.m.
```
data _null_;
    begin = 32083;
    put begin tod9.;
run;
```

SAS Statement | Result
--- | ---
begin = 32083;
put begin tod9.; | 08:54:43

VAXRBw.d Format
Writes real binary (floating-point) data in VMS format.

Categories: CAS
Numeric

Alignment: Right
Syntax

VAXRB\(w.d\)

Syntax Description

\(w\)

specifies the width of the output field.

Default 8

Range 2–8

\(d\)

specifies the power of 10 by which to divide the value. This argument is optional.

Default 0

Range 0–31

Details

Use the VAXRB\(w.d\) format to write data in native VAX or VMS floating-point notation.

Comparisons

If you use SAS that is running under VAX or VMS, the VAXRB\(w.d\) and RB\(w.d\) formats are identical.

Example

```sas
data one;
  x=1;
  y=put(x,vaxrb8.);
  put y $hex16.;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result ¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>8040000000000000</td>
</tr>
</tbody>
</table>

¹ The result is the hexadecimal representation for the integer.

VMSZN\(w.d\) Format

Generates VMS and MicroFocus COBOL zoned numeric data.

Category: Numeric

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

VMSZN\(w.d\)

Syntax Description

\(w\)

specifies the width of the output field.

Default \(1\)

Range \(1–32\)

\(d\)

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Details

The VMSZN\(w.d\) format is similar to the ZD\(w.d\) format. Both generate a string of ASCII digits, and the last digit is a special character that denotes the magnitude of the last digit and the sign of the entire number. The difference between these formats is in the special character that is used for the last digit. This table shows the special characters that are used by the VMSZN\(w.d\) format.

<table>
<thead>
<tr>
<th>Desired Digit</th>
<th>Special Character</th>
<th>Desired Digit</th>
<th>Special Character</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>–0</td>
<td>p</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>–1</td>
<td>q</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>–2</td>
<td>r</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>–3</td>
<td>s</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>–4</td>
<td>t</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>–5</td>
<td>u</td>
</tr>
<tr>
<td>6</td>
<td>6</td>
<td>–6</td>
<td>v</td>
</tr>
<tr>
<td>7</td>
<td>7</td>
<td>–7</td>
<td>w</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>–8</td>
<td>x</td>
</tr>
<tr>
<td>9</td>
<td>9</td>
<td>–9</td>
<td>y</td>
</tr>
</tbody>
</table>

If the value to be formatted is too large to fit in a field of the specified width, the VMSZN\(w.d\) format handles values this way:
For positive values, it sets the output to the largest positive number that fits in the given width.

For negative values, it sets the output to the negative number of greatest magnitude that fits in the given width.

Example

data one;
  x=1234;
  put x vmszn4.;
  put x vmszn5.1;
  put x vmszn6.2;
  put x vmszn5.;
run;

SAS writes the following results to the log:

```
-----+----1
 1234
 12340
 123400
 01234
```

Informats:
- "VMSZNw.d Informat" on page 640

w.d Format

Writes standard numeric data one digit per byte.

Categories: CAS
            Numeric

Alignment: Right

Alias: Fw.d

Interaction: When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

Syntax

w.d
Syntax Description

\( w \)

specifies the width of the output field.

Range 1–32

Tip Allow enough space to write the value, the decimal point, and a minus sign, if necessary.

\( d \)

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Range 0–31

Requirement must be less than \( w \)

Tip If \( d \) is 0 or you omit \( d \), \( w.d \) writes the value without a decimal point.

Details

The \( w.d \) format rounds to the nearest number that fits in the output field. If \( w.d \) is too small, SAS might shift the decimal to the BESTw. format. The \( w.d \) format writes negative numbers with leading minus signs. In addition, \( w.d \) right-aligns before writing and pads the output with leading blanks.

Comparisons

The \( Zw.d \) format is similar to the \( w.d \) format except that \( Zw.d \) pads right-aligned output with 0s instead of blanks.

Example

```r
data one;
  x=23.45;
  put x 6.3;
run;
```

<table>
<thead>
<tr>
<th>Value of x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>23.45</td>
<td>23.450</td>
</tr>
</tbody>
</table>

WEEKDATEw. Format

Writes date values as the day of the week and the date in the form day-of-week, month-name dd, yy (or yyyy).

Category: Date and Time

Alignment: Right
Restriction: Use the NLDATEw format on the CAS server instead of the WEEKDATEw format.

Syntax

WEEKDATEw.

Syntax Description

w

specifies the width of the output field.

Default 29

Range 3–37

Details

The WEEKDATEw format writes SAS date values in the form day-of-week, month-name dd, yy (or yyyy):

dd

is an integer that represents the day of the month.

yy or yyyy

is a two-digit or four-digit integer that represents the year.

If w is too small to write the complete day of the week and month, SAS abbreviates as needed.

Comparisons

The WEEKDATEw format is the same as the WEEKDATXw format, except that WEEKDATXw prints dd before the month's name.

Example

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

```
   data one;
      mydate='14jun2018'd;
      put mydate weekdate3.;
      put mydate weekdate9.;
      put mydate weekdate15.;
      put mydate weekdate17.;
      run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate weekdate3.;</td>
<td>Thu</td>
</tr>
<tr>
<td>put mydate weekdate9.;</td>
<td>Thursday</td>
</tr>
</tbody>
</table>
WEEKDATXw. Format

WEEKDATXw. Format writes date values as the day of the week and date in the form day-of-week, dd month-name yy (or yyyy).

### Categories:
- CAS
- Date and Time

### Alignment:
- Right

### Syntax

```
WEEKDATXw.
```
Syntax Description

**w**
specifies the width of the output field.

**Default** 29

**Range** 3–37

Details

The WEEKDATX<code>w</code>. format writes SAS date values in the form *day-of-week, dd month-name, yy (or yyyy)*:

- *dd* is an integer that represents the day of the month.
- *yy* or *yyyy* is a two-digit or a four-digit integer that represents the year.

If *w* is too small to write the complete day of the week and month, SAS abbreviates as needed.

Comparisons

The WEEKDATE<code>w</code>. format is the same as the WEEKDATX<code>w</code>. format, except that WEEKDATE<code>w</code>. prints *dd* after the month's name.

The WEEKDATX<code>w</code>. format is the same as the DTWKDATX<code>w</code>. format, except that DTWKDATX<code>w</code>. expects a datetime value as input.

Example

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

```sas
data one;
  mydate='14jun2018'd;
  put mydate weekdatx.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate weekdatx.;</td>
<td>Thursday, 14 June 2018</td>
</tr>
</tbody>
</table>

WEEKDAYw. Format

WEEKDAYw. Format

Writes date values as the day of the week.

Syntax

\[ \text{WEEKDAY}w. \]

Syntax Description

\( w \)

specifies the width of the output field.

Default 1

Range 1–32

Details

The WEEKDAYw. format writes a SAS date value as the day of the week (where 1=Sunday, 2=Monday, and so on).

Example

\[
\text{data one;}
\]
The example table uses the input value of 21442, which is the SAS date value that corresponds to September 15, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate weekday.;</td>
<td>7</td>
</tr>
</tbody>
</table>

See Also

**Formats:**
- “DOWNAMEw. Format” on page 173

**Functions**
- “WEEKDAY Function” in SAS Functions and CALL Routines: Reference

---

**WEEKUw. Format**

Writes a week number in decimal format by using the U algorithm.

- **Category:** Date and Time
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

**Syntax**

```
WEEKUw.
```

**Syntax Description**

- `w` specifies the width of the output field.
  - **Default** 11
  - **Range** 2–200

**Details**

The WEEKUw. format writes a week-number format. The WEEKUw. format writes the various formats depending on the specified width. Algorithm U calculates the SAS date value by using the number of the week within the year. (Sunday is
considered the first day of the week.) The number-of-the-week value is represented as a decimal number in the range 0–53, with a leading 0 and maximum value of 53. For example, the fifth week of the year would be represented as 05.

Here are widths, formats, and examples:

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>w01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>18W01</td>
</tr>
<tr>
<td>7-8</td>
<td>yyWwwdd</td>
<td>18W0101</td>
</tr>
<tr>
<td>9-10</td>
<td>yyyyWwwdd</td>
<td>2018W0101</td>
</tr>
<tr>
<td>11-200</td>
<td>yyyy-Www-dd</td>
<td>2018-W01-01</td>
</tr>
</tbody>
</table>

Comparisons

The WEEKVw. format writes the week number as a decimal number in the range 01–53. Weeks that begin on a Monday and week 1 of the year include January 4 and the first Thursday of the year. If the first Monday of January is 2, 3, or 4, the preceding days are part of the last week of the preceding year. The WEEKWw. format writes the week number of the year as a decimal number in the range 00–53, with Monday as the first day of week 1. The WEEKUw. format writes the week number of the year (with Sunday as the first day of the week) as a decimal number in the range 0–53, with a leading 0.

Example

```sas
data one;
  sasdate='16apr2018'd;
  put sasdate weeku3.;
  put sasdate weeku5.;
  put sasdate weeku7.;
  put sasdate weeku9.;
  put sasdate weeku11.;
run;
```

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdate weeku3.;</td>
<td>W15</td>
</tr>
<tr>
<td>put sasdate weeku5.;</td>
<td>18W15</td>
</tr>
<tr>
<td>put sasdate weeku7.;</td>
<td>18W1502</td>
</tr>
<tr>
<td>put sasdate weeku9.;</td>
<td>2018W1502</td>
</tr>
</tbody>
</table>
WEEKVw. Format

WEEKVw. Format writes a week number in decimal format by using the V algorithm.

Category: Date and Time
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

\texttt{WEEKVw.}

Syntax Description

\texttt{w}

\begin{itemize}
\item \texttt{w} specifies the width of the output field.
\end{itemize}

\begin{center}
\begin{tabular}{ll}
Default & 11 \\
Range & 2–200 \\
\end{tabular}
\end{center}

Details

The WEEKVw. format writes the various formats depending on the specified width. Algorithm V calculates the SAS date value. The number-of-the-week value is represented as a decimal number in the range 01–53, with a leading 0 and
maximum value of 53. Weeks begin on a Monday and week 1 of the year is the
week that includes both January 4 and the first Thursday of the year. If the first
Monday of January is 2, 3, or 4, the preceding days are part of the last week of the
preceding year. For example, the fifth week of the year would be represented as 06.

Here are the widths, formats, and examples:

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>w01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>18W01</td>
</tr>
<tr>
<td>7-8</td>
<td>yyWwwdd</td>
<td>18W0101</td>
</tr>
<tr>
<td>9-10</td>
<td>yyyyWwwdd</td>
<td>2018W0101</td>
</tr>
<tr>
<td>11-200</td>
<td>yyyy-Www-dd</td>
<td>2018-W01-01</td>
</tr>
</tbody>
</table>

Comparisons

The WEEKvWw. format writes the week number as a decimal number in the range
01–53. Weeks that begin on a Monday and week 1 of the year include January 4 and
the first Thursday of the year. If the first Monday of January is 2, 3, or 4, the
preceding days are part of the last week of the preceding year. The WEEKWw.
format writes the week number of the year as a decimal number in the range 00–53,
with Monday as the first day of week 1. The WEEKUw. format writes the week
number of the year (with Sunday as the first day of the week) as a decimal number
in the range 0–53, with a leading 0.

Example

data one;
  sasdate='16apr2018'd;
  put sasdate weekv3.;
  put sasdate weekv5.;
  put sasdate weekv7.;
  put sasdate weekv9.;
  put sasdate weekv11.;
run;

WORDDATEw. Format

Writes date values as the name of the month, the day, and the year in the form month-name dd, yyyy.

Category: Date and Time

Alignment: Right

Restriction: The WORDDATEw. format is not valid on the CAS server. Use the NLDATEw. format on the CAS server instead of the WORDDATEw. format.

Syntax

**WORDDATEw.**

Syntax Description

\[ w \]

specifies the width of the output field.

Default: 18

Range: 3–32

Details

The WORDDATEw. format writes SAS date values in the form month-name dd, yyyy.
**dd**

is an integer that represents the day of the month.

**yyyy**

is a four-digit integer that represents the year.

If the width is too small to write the complete month, SAS abbreviates as necessary.

**Comparisons**

The *WORDDATEw.* format is the same as the *WORDDATXw.* format, except that *WORDDATXw.* prints *dd* before the month's name.

**Example**

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

```sas
data one;
  mydate='14jun2018'd;
  put mydate worddate3.;
  put mydate worddate9.;
  put mydate worddate12.;
  put mydate worddate20.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate worddate3.;</td>
<td>Jun</td>
</tr>
<tr>
<td>put mydate worddate9.;</td>
<td>June</td>
</tr>
<tr>
<td>put mydate worddate12.;</td>
<td>Jun 14, 2018</td>
</tr>
<tr>
<td>put mydate worddate20.;</td>
<td>June 14, 2018</td>
</tr>
</tbody>
</table>

**See Also**

**Formats:**

- "*WORDDATXw. Format*" on page 442

**WORDDATXw. Format**

Writes date values as the day, the name of the month, and the year in the form *dd month-name yyyy*.

**Category:** Date and Time
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

\texttt{WORDDATXw.}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default: 18

Range: 3–32

Details

The \texttt{WORDDATXw.} format writes SAS date values in the form \textit{dd month-name, yyyy}:

\texttt{dd}

is an integer that represents the day of the month. For days 1–9, the leading 0 is not displayed.

\texttt{yyyy}

is a four-digit integer that represents the year.

If the width is too small to write the complete month, SAS abbreviates as necessary.

Comparisons

The \texttt{WORDDATXw.} format is the same as the \texttt{WORDDATEw.} format, except that \texttt{WORDDATEw.} prints \texttt{dd} after the month's name.

Example

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

\begin{verbatim}
data one;
  mydate='14jun2018'd;
  put mydate worddatx.;
run;
\end{verbatim}

\begin{tabular}{|l|l|}
  \hline
  \textbf{SAS Statement} & \textbf{Result} \\
  \hline
  put mydate worddatx.; & 14 June 2018 \\
  \hline
\end{tabular}

- "WORDDATEw. Format" on page 441

WORDFw. Format

Writes numeric values as words with fractions that are shown numerically.

Category: Numeric
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

`WORDFw.`

Syntax Description

`w`

specifies the width of the output field.

Default 10
Range 5–32767

Details

The WORDFw. format converts numeric values to their equivalent in English words, with fractions that are represented numerically in hundredths. For example, 8.2 is printed as eight and 20/100.

Negative numbers are preceded by the word minus. When the value's equivalent in words does not fit in the specified field, the word is truncated on the right and the last character is printed as an asterisk.

Comparisons

The WORDFw. format is similar to the WORDSw. format, except that WORDFw. prints fractions as numbers instead of words.

Example

```plaintext
data one;
  value=2.5;
  put value wordf15.;
run;
```
### WORDSw. Format

**Writes numeric values as words.**

- **Category:** Numeric
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

### Syntax

**WORDSw.**

#### Syntax Description

- \( w \) specifies the width of the output field.

  - **Default:** 10
  - **Range:** 5–32767

### Details

You can use the WORDSw. format to print checks with the amount written below the payee line.

Negative numbers are preceded by the word minus. If the number is not an integer, the fractional portion is represented as hundredths. For example, 5.3 is printed as five and thirty hundredths. When the value’s equivalent in words does not fit in the specified field, the word is truncated on the right and the last character is printed as an asterisk.

### Comparisons

The WORDSw. format is similar to the WORDFw. format, except that WORDSw. prints fractions as words instead of numbers.

### Table

<table>
<thead>
<tr>
<th>Value of value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.5</td>
<td>two and 50/100</td>
</tr>
</tbody>
</table>
Example

data one;
   value=2.5;
   put value words25.;
run;

<table>
<thead>
<tr>
<th>Value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.5</td>
<td>two and fifty hundredths</td>
</tr>
</tbody>
</table>

YEARw. Format

Writes date values as the year.

Categories: CAS
           Date and Time

Alignment: Right

Syntax

YEARw.

Syntax Description

w  specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>2–32</td>
</tr>
<tr>
<td>Tip</td>
<td>If w is less than 4, the last two digits of the year are printed. Otherwise, the year value is printed as four digits.</td>
</tr>
</tbody>
</table>

Details

The YEARw. format is similar to the DTYEARw. format in that they both write date values. The difference is that YEARw. expects a SAS date value as input, and DTYEARw. expects a datetime value.
Example

data one;
    mydate='14jun2018'd;
    put mydate year2.;
    put mydate year4.;
run;

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate year2.;</td>
<td>18</td>
</tr>
<tr>
<td>put mydate year4.;</td>
<td>2018</td>
</tr>
</tbody>
</table>

- "DTYEARw. Format" on page 178

YYMMw. Format

Writes date values in the form <yy>yyMmm, where M is a character separator to indicate that the month number follows the M and the year appears as either two or four digits.

Categories: CAS
            Date and Time

Alignment: Right

Syntax

YYMMw.

Syntax Description

w

specifies the width of the output field.

| Default | 7    |
| Range   | 5–32 |

Interaction

When w has a value of 5 or 6, the date appears with only the last two digits of the year. When w is 7 or more, the date appears with a four-digit year.
Details

The YYMMw. format writes SAS date values in the form <yy>yyMmm.

<yy>yy
  is a two-digit or four-digit integer that represents the year.

M
  is the character separator to indicate that the number of the month follows.

mm
  is an integer that represents the month.

Example

```sas
data one;
  mydate='14jun2018'd;
  put mydate yymm.;
  put mydate yymm5.;
  put mydate yymm6.;
  put mydate yymm7.;
  put mydate yymm10.;
run;
```

The following examples use the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate yymm.;</td>
<td>2018M06</td>
</tr>
<tr>
<td>put mydate yymm5.;</td>
<td>18M06</td>
</tr>
<tr>
<td>put mydate yymm6.;</td>
<td>18M06</td>
</tr>
<tr>
<td>put mydate yymm7.;</td>
<td>2018M06</td>
</tr>
<tr>
<td>put mydate yymm10.;</td>
<td>20182M0610</td>
</tr>
</tbody>
</table>

Formats:

- "MMYYw. Format" on page 224
- "YYMMxw. Format" on page 453
YYMMDDw. Format

Writes date values in the form `yymmd` or `<yy> yy-mm-dd`, where a hyphen is the separator and the year appears as either two or four digits.

**Syntax**

`YYMMDDw.`

**Syntax Description**

- **w** specifies the width of the output field.
  - Default: 8
  - Range: 2–10
  - Interaction: When `w` has a value from 2 to 5, the date appears with as much of the year and the month as possible. When `w` is 7, the date appears as a two-digit year without hyphens.

**Details**

The `YYMMDDw.` format writes SAS date values in one of these forms:

- `yymmd`
- `<yy> yy-mm-dd`

The letters and special character are defined as follows:

- `<yy>` `yy` is a two-digit or four-digit integer that represents the year.
- `-` is the separator.
- `mm` is an integer that represents the month.
- `dd` is an integer that represents the day of the month.

To format a date that has a four-digit year and no separators, use the `YYMMDDx.` format.

**Example**

```data one;```
mydate='03apr2018'd;
put mydate yymmdd2.;
put mydate yymmdd3.;
put mydate yymmdd4.;
put mydate yymmdd5.;
put mydate yymmdd6.;
put mydate yymmdd7.;
put mydate yymmdd8.;
put mydate yymmdd10.;
run;

The following examples use the input value of 21277, which is the SAS date value that corresponds to April 3, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate yymmdd2.;</td>
<td>18</td>
</tr>
<tr>
<td>put mydate yymmdd3.;</td>
<td>18</td>
</tr>
<tr>
<td>put mydate yymmdd4.;</td>
<td>1804</td>
</tr>
<tr>
<td>put mydate yymmdd5.;</td>
<td>18-04</td>
</tr>
<tr>
<td>put mydate yymmdd6.;</td>
<td>180403</td>
</tr>
<tr>
<td>put mydate yymmdd7.;</td>
<td>180403</td>
</tr>
<tr>
<td>put mydate yymmdd8.;</td>
<td>18-04-03</td>
</tr>
<tr>
<td>put mydate yymmdd10.;</td>
<td>2018-04-03</td>
</tr>
</tbody>
</table>

YYMMDDxw. Format

Writes date values in the form yymmdd or <yy>yy-mm-dd, where the x in the format name is a character that represents the special character that separates the year, month, and day. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator. The year can be either two or four digits.

Categories: CAS  
Date and Time

Alignment: Right

Syntax

YYMMDDxw.

Syntax Description

x  
identifies a separator or specifies that no separator appear between the year, the month, and the day. These are the valid values for x:

B  
separates with a blank.

C  
separates with a colon.

D  
separates with a hyphen.

N  
indicates no separator.

P  
separates with a period.

S  
separates with a slash.

w  
specifies the width of the output field.

Default  8  
Range  2–10

Interactions  When w has a value from 2 to 5, the date appears with as much of the year and the month. When w is 7, the date appears as a two-digit year without separators.
When \( x \) has a value of \( N \), the width range is 2–8.

Details

The YYMMDD\(wx\) format writes SAS date values in one of these forms:

- **yymmdd**
- \(<yy>yxmmxxdd</yy>\)

The letters and special character are defined as follows:

- \(<yy>yy</yy>\) is a two-digit or four-digit integer that represents the year.
- \(x\) is a specified separator.
- **mm** is an integer that represents the month.
- **dd** is an integer that represents the day of the month.

Example

```sas
data one;
  mydate='14may2018'd;
  put mydate yymmddc5.;
  put mydate yymmddd8.;
  put mydate yymmddp10.;
  put mydate yymmddn8.;
run;
```

The following examples use the input value of 21318, which is the SAS date value that corresponds to May 14, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate yymmddc5.;</td>
<td>18:05</td>
</tr>
<tr>
<td>put mydate yymmddd8.;</td>
<td>18-05-14</td>
</tr>
<tr>
<td>put mydate yymmddp10.;</td>
<td>2018.05.14</td>
</tr>
<tr>
<td>put mydate yymmddn8.;</td>
<td>20180514</td>
</tr>
</tbody>
</table>

YYMMxw. Format

Writes date values in the form <yy>yy-mm or <yy>yy-mm. The x in the format name represents the special character that separates the year and the month. This special character can be a hyphen (-), period (.), slash (/), colon (:), or no separator. The year can be either two or four digits.

Categories: CAS  
Date and Time  

Alignment: Right

Syntax

YYMMxw.

Syntax Description

x

identifies a separator or specifies that no separator appear between the year and the month. These are valid values for x:

C  
separates with a colon.

D  
separates with a hyphen.

N  
indicates no separator.

P  
separates with a period.

S  
separates with a forward slash.

w

specifies the width of the output field.

Default 7
Range 5–32

Interactions When \( x \) is set to \( N \), no separator is specified. The width range is 4–32, and the default changes to 6.

When \( x \) has a value of \( C, D, P, \) or \( S \) and \( w \) has a value of 5 or 6, the date appears with only the last two digits of the year. When \( w \) is 7 or more, the date appears with a four-digit year.

When \( x \) has a value of \( N \) and \( w \) has a value of 4 or 5, the date appears with only the last two digits of the year. When \( x \) has a value of \( N \) and \( w \) is 6 or more, the date appears with a four-digit year.

Details

The YYMM\( x w \). format writes SAS date values in one of these forms:

\(<yy>yy/mm\)

\(<yy>yyX/mm\)

The letters are defined as follows:

\(<yy>yy\)

is a two-digit or four-digit integer that represents the year.

\(x\)

is a specified separator.

\(mm\)

is an integer that represents the month.

Example

The following examples use the input value of 2138, which is the SAS date value that corresponds to May 14, 2018.

```
data one;
  mydate='14may2018'd;
put mydate yymmc5.;
put mydate yymmd.;
put mydate yymmn4.;
put mydate yymmp8.;
put mydate yymms10.;
run;
```

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>put mydate yymmc5.;</td>
<td>18:05</td>
</tr>
<tr>
<td>put mydate yymmd.;</td>
<td>2018-05</td>
</tr>
<tr>
<td>put mydate yymmn4.;</td>
<td>1805</td>
</tr>
</tbody>
</table>
### YYMONw. Format

**Writes date values in the form yymm or yyyyymm.**

**Categories:**
- CAS
- Date and Time
- Numeric

**Alignment:** Right

**Syntax**

\[ \text{YYMONw.} \]

**Syntax Description**

\[ w \]

\> specifies the width of the output field. If the format width is too small to print a four-digit year, only the last two digits of the year are printed.

- **Default:** 7
- **Range:** 5–32

**Details**

The YYMONw. format writes SAS date values in the form \langle yy\rangle yymm:

\< yy\rangle yy

is a two-digit or four-digit integer that represents the year.

\> mmm

is the name of the month, abbreviated to three characters.
Example

data one;
    mydate='14jun2018'd;
    put mydate yymon6.;
    put mydate yymon7.;
run;

The example table uses the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>

**YYQw. Format**

Writes date values in the form <yy>yyQq, where Q is the separator, the year appears as either two or four digits, and q is the quarter of the year.

**Categories:**
- CAS
- Date and Time

**Alignment:** Right

**Syntax**

`YYQw`.

**Syntax Description**

`w` specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>4–32</td>
</tr>
</tbody>
</table>
Interaction

When \( w \) has a value of 4 or 5, the date appears with only the last two digits of the year. When \( w \) is 6 or more, the date appears with a four-digit year.

Details

The YYQw. format writes SAS date values in the form \(<yy>yyQq.\)

\(<yy>yy\)

is a two-digit or four-digit integer that represents the year.

\(Q\)

is the character separator.

\(q\)

is an integer (1, 2, 3, or 4) that represents the quarter of the year.

Example

The following examples use the input value of 21349, which is the SAS date value that corresponds to June 14, 2018.

```sas
data one;
  mydate='14jun2018'd;
  put mydate yyq.;
  put mydate yyq4.;
  put mydate yyq5.;
  put mydate yyq6.;
  put mydate yyq10.;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put mydate yyq.;</td>
<td>2018Q2</td>
</tr>
<tr>
<td>put mydate yyq4.;</td>
<td>18Q2</td>
</tr>
<tr>
<td>put mydate yyq5.;</td>
<td>18Q2</td>
</tr>
<tr>
<td>put mydate yyq6.;</td>
<td>2018Q2</td>
</tr>
<tr>
<td>put mydate yyq10.;</td>
<td>2018Q2</td>
</tr>
</tbody>

YYQxw. Format

Writes date values in the form <yy>yyq or <yy>yy-q, where the x in the format name is a character that represents the special character that separates the year and the quarter or the year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator. The year can be either two or four digits.

Categories: CAS  
Date and Time

Alignment: Right

Syntax

YYQxw.

Syntax Description

x
identifies a separator or specifies that no separator appear between the year and the quarter. These are the valid values for x:

C
separates with a colon

D
separates with a hyphen

N
indicates no separator

P
separates with a period

S
separates with a forward slash.

w
specifies the width of the output field.

Default 6

Range 4–32

Interactions

When x is set to N, no separator is specified. The width range is 3–32, and the default changes to 5.

When w has a value of 4 or 5, the date appears with only the last two digits of the year. When w is 6 or more, the date appears with a four-digit year.

When x has a value of N and w has a value of 3 or 4, the date appears with only the last two digits of the year. When x has a value of N and w is 5 or more, the date appears with a four-digit year.
Details

The YYQw. format writes SAS date values in one of these forms:

- `<yy>yyq`
- `<yy>yyxq`

The letters and special character are defined as follows:

- `<yy>yy`
  - is a two-digit or four-digit integer that represents the year.
- `x`
  - is a specified separator.
- `q`
  - is an integer (1, 2, 3, or 4) that represents the quarter of the year.

Example

The following examples use the input value of 21366, which is the SAS date value that corresponds to July 01, 2018.

```sas
data one;
  mydate='01jul2018'd;
  put mydate yyqc4.;
  put mydate yyqd.;
  put mydate yyqn3.;
  put mydate yyqp6.;
  put mydate yyqs8.;
run;
```

**YYQRxw. Format**

Writes date values in the form `<yy>yyqr` or `<yy>yy-qr`, where the `x` in the format name is a character that represents the special character. The special character separates the year and the quarter or the year. The special character can be a hyphen (-), period (.), blank character, slash (/), colon (:), or no separator. The year can be either two or four digits, and `qr` is the quarter of the year expressed in Roman numerals.

**Categories:**
- CAS
- Date and Time
- Numeric

**Alignment:**
- Right

**Syntax**

`YYQRxw`

**Syntax Description**

- `x`
  - identifies a separator or specifies that no separator appear between the year and the quarter. Here are valid values for `x`.
  - `C`
    - separates with a colon.
  - `D`
    - separates with a hyphen.
N indicates no separator.

P separates with a period.

S separates with a forward slash.

w specifies the width of the output field.

**Default** 8

**Range** 6–32

**Interactions** When \( x \) is set to \( N \), no separator is specified. The width range is 5–32, and the default changes to 7.

When the value of \( w \) is too small to write a four-digit year, the date appears with only the last two digits of the year.

**Details**

The YYQR\( x \)w. format writes SAS date values in one of these forms:

\(<yy>yyqr\)

\(<yy>yyxqr\)

The letters and special character are defined as follows:

\(<yy>yy\)

is a two-digit or four-digit integer that represents the year.

\(x\)

is a specified separator.

\(qr\)

is a Roman numeral (I, II, III, or IV) that represents the quarter of the year.

**Example**

The following examples use the input value of 21318, which is the SAS date value that corresponds to May 14, 2018.

```sas
data _null_;  
  input date anydtdte12.;  
  put date;  
  put date yyqrc6.;  
  put date yyqrd.;  
  put date yyqrn5.;  
  put date yyqrp8.;  
  put date yyqrs10.;  
  datalines;  
  05/14/2018  
;  
run;
```
<table>

**Formats:**
- “YYQxw. Format” on page 458
- “YYQRw. Format” on page 460

**YYQZw. Format**

Writes SAS date values in the form `<yy><qq>`, the year appears as 2 or 4 digits, and `qq` is the quarter of the year.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Right

**Syntax**

`YYQZw.`

**Required Arguments**

- `Z`
  - specifies that no separator appear between the year and the quarter.

- `w`
  - specifies the width of the output field.

  **Default**: 4
  **Range**: 4–6
Details

The YYQZw. format writes SAS date values in the form <yy> <qq>. Here is an explanation of the syntax:

<yy>
   is a two-digit or four-digit integer that represents the year.

Z
   specifies that there is no separator.

<qq>
   is an integer (01, 02, 03, or 04) that represents the quarter of the year.

Example

The following examples use the input value of 20999. 20999 is the SAS date value that corresponds to June 29, 2017.

```
data _null_;   
declare char(20) a b; 
method run(); 
   a=put (20999,yyqz6.); 
   b=put (20999,yyqz4.); 
   put a= b=; 
end; 
enddata; 
run; 
```

SAS writes the following output to the log.

```
a=201702    b=1702
```

- “YYQRxw. Format” in SAS DS2 Language Reference

YYWEEKUw. Format

Writes a week number in decimal format by using the U algorithm, excluding day-of-the-week information.

Categories: CAS
Date and Time

Alignment: Left
Syntax

YYWEEKUw.

Syntax Description

w

specifies the width of the output field.

Default 7

Range 2-8

Details

The YYWEEKUw. format writes a week-number format. The YYWEEKUw. format writes the various formats depending on the specified width. Algorithm U calculates the SAS date value by using the number of the week within the year (Sunday is considered the first day of the week).

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>W01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
<tr>
<td>9-above</td>
<td>invalid</td>
<td>invalid</td>
</tr>
</tbody>
</table>

Comparisons

The YYWEEKUw. format is similar to the WEEKUw. format except that the YYWEEKUw. format does not specify the day-of-week information. Also, the YYWEEKUw. format does not accept any width that is greater than 8.

Example

sasdate = '01JAN2007'd;

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>u=put(sasdate,yyweeku3.);</td>
<td>W00</td>
</tr>
<tr>
<td>v=put(sasdate,yyweeku4.);</td>
<td>W00</td>
</tr>
<tr>
<td>w=put(sasdate,yyweeku5.);</td>
<td>07W00</td>
</tr>
<tr>
<td>x=put(sasdate,yyweeku6.);</td>
<td>07W00</td>
</tr>
</tbody>
</table>
### YYWEEKVw. Format

**Writes a week number in decimal format by using the V algorithm, excluding day-of-the-week information.**

**Categories:**
- CAS
- Date and Time

**Alignment:** Left

### Syntax

**YYWEEKVw.**

### Syntax Description

**w**

Specifies the width of the output field.

- **Default:** 7
- **Range:** 2–8

### Details

The YYWEEKVw. format writes the various formats depending on the specified width. Algorithm V calculates the SAS date value, and the number-of-the-week value is represented as a decimal number in the range 01–53, with a leading zero and maximum value of 53. Weeks begin on a Monday and week 1 of the year is the week that includes both January 4 and the first Thursday of the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year. For example, the fifth week of the year would be represented as 06.

For more information about widths, formats, and examples see the following table:
<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>www</td>
<td>w01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
<tr>
<td>9-above</td>
<td>invalid</td>
<td>invalid</td>
</tr>
</tbody>
</table>

**Comparisons**

The **YYWEEKWw. format** is similar to the **WEEKVw. format** except that the YYWEEKWw. format does not specify the day-of-week information. Also, the YYWEEKWw. format does not accept a width that is greater than 8.

**Example**

```sas
sasdate = '01JAN2007'd;

u=put(sasdate,yyweekv3.);
v=put(sasdate,yyweekv4.);
w=put(sasdate,yyweekv5.);
x=put(sasdate,yyweekv6.);
y=put(sasdate,yyweekv7.);
z=put(sasdate,yyweekv8.);
put u;
put v;
put w;
put x;
put y;
put z;
```

Writes a week number in decimal format by using the W algorithm, excluding the day-of-week information.
Syntax

**YYWEEKWw.**

Syntax Description

w
-specified the width of the output field.

Default

-7

Range

-2–8

Details

The YYWEEKWw. format writes the various formats depending on the specified width. Algorithm W calculates the SAS date value using the number of the week within the year.

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>W01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
<tr>
<td>9-above</td>
<td>invalid</td>
<td>invalid</td>
</tr>
</tbody>
</table>

Comparisons

The YYWEEKWw. format is similar to the WEEKWw. format except that the YYWEEKWw. format does not specify the day-of-week information. Also, the YYWEEKWw. format does not accept any width that is greater than 8.

Example

```sasdate = '01JAN2007'd```
### Zw.d Format

Writes standard numeric data with leading 0s.

**Categories:**
- CAS
- Numeric

**Alignment:** Right

**Interaction:**
When the DECIMALCONV= system option is set to STDIEEE, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

### Syntax

**Zw.d**

#### Syntax Description

**w**

specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1–32</td>
<td>Allow enough space to write the value, the decimal point, and a minus sign, if necessary.</td>
</tr>
</tbody>
</table>

---

```
Statements          | Results
-------------------|--------
---+----1----+-----

u=put(sasdate,yyweekw3.);       W01
v=put(sasdate,yyweekw4.);       W01
w=put(sasdate,yyweekw5.);       07W01
x=put(sasdate,yyweekw6.);       07W01
y=put(sasdate,yyweekw7.);       2007W01
z=put(sasdate,yyweekw8.);       2007-W01
put u;
put v;
put w;
put x;
put y;
put z;
```

### See Also

**Format:**

---

### Statements

```
Statements          | Results
-------------------|--------
---+----1----+-----

u=put(sasdate,yyweekw3.);       W01
v=put(sasdate,yyweekw4.);       W01
w=put(sasdate,yyweekw5.);       07W01
x=put(sasdate,yyweekw6.);       07W01
y=put(sasdate,yyweekw7.);       2007W01
z=put(sasdate,yyweekw8.);       2007-W01
put u;
put v;
put w;
put x;
put y;
put z;
```
The `Zw.d` format writes standard numeric values one digit per byte and fills in 0s to the left of the data value.

The `Zw.d` format rounds to the nearest number that fits in the output field. If `w.d` is too large to fit, SAS might shift the decimal to the `BESTw` format. The `Zw.d` format writes negative numbers with leading minus signs. In addition, it right-aligns before writing and pads the output with leading 0s.

## Comparisons

The `Zw.d` format is similar to the `w.d` format, except that `Zw.d` pads right-aligned output with 0s instead of blanks.

### Example

```sas
data one;
  num=1350;
  put num z8.;
run;
```

<table>
<thead>
<tr>
<th>Value of num</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1350</td>
<td>00001350</td>
</tr>
</tbody>
</table>

### ZDw.d Format

Writes numeric data in zoned decimal format.

Category: Numeric

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.

Interaction: When the `DECIMALCONV=` system option is set to `STDIEEE`, the output that is written using this format might differ slightly from previous releases. For more information, see “DECIMALCONV= System Option” in SAS System Options: Reference.

See: “ZD Format: UNIX” in SAS Companion for UNIX Environments
Syntax

**ZDw.d**

Syntax Description

- **w**
  - Specifies the width of the output field.
  - Default: 1
  - Range: 1–32

- **d**
  - Specifies to multiply the number by \(10^d\). This argument is optional.
  - Default: 0
  - Range: 0–31

Details

The zoned decimal format is similar to standard numeric format in that every digit requires 1 byte. However, the value's sign is in the last byte, along with the last digit.

**Note:** Different operating environments store zoned decimal values in different ways. However, the ZDw.d format writes zoned decimal values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Comparisons

The following table compares the zoned decimal format with notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Zoned Decimal Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>ZD3.</td>
</tr>
<tr>
<td>PL/I</td>
<td>PICTURE '99T'</td>
</tr>
<tr>
<td>COBOL</td>
<td>DISPLAY PIC S 999</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>ZL3</td>
</tr>
</tbody>
</table>
Example

data one;
  num=1350;
  put num zd8.;
run;

<table>
<thead>
<tr>
<th>Value of num</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1350</td>
<td>0000135{</td>
</tr>
</tbody>
</table>

1 The result is a hexadecimal representation of a binary number in zoned decimal format on an IBM mainframe computer. Each byte occupies one column of the output field.
PART 2

SAS Informats

Chapter 3

About Informats .......................................................... 475

Chapter 4

Dictionary of Informats .................................................. 495
Definition of Informats

An informat is a type of SAS language element that applies a pattern to or executes instructions for a data value to be read as input. Types of informats correspond to the data's type: numeric, character, date, time, or timestamp. The ability to create user-defined informats is also supported. Examples of SAS informats are BINARY, DATE, and COMMA. For example, the following value contains a dollar sign and commas:

$1,000,000

To remove the dollar sign ($) and commas (,) before storing the numeric value 1000000 in a variable, read this value with the COMMA11. informat.
Unless you explicitly define a variable first, SAS uses the informat to determine whether the variable is numeric or character. SAS also uses the informat to determine the length of character variables.

Syntax

SAS informats have the following form:

<$>informat<w>.<d>

$ indicates a character informat; its absence indicates a numeric informat.

informat

names the informat. The informat is a SAS informat or a user-defined informat that was previously defined with the INVALUE statement in PROC FORMAT. “FORMAT Procedure” in Base SAS Procedures Guide.

w

specifies the informat width, which for most informats is the number of columns in the input data.

d

specifies an optional decimal scaling factor in the numeric informats. SAS divides the input data by 10 to the power of d.

Note: Even though SAS can read up to 32 digits when you specify some numeric informats, numbers with more than 15 significant digits might lose precision due to the limitations of the 8-byte floating-point representation used by most computers.

Informat width always contain a period (.) as a part of the name. If you omit the w and d values from the informat, SAS uses default values. If the data contains decimal points, SAS ignores the d value and reads the number of decimal places that are actually in the input data.

If the informat width is too narrow to read all the columns in the input data, you might get unexpected results. The problem frequently occurs with the date and time informats. You must adjust the width of the informat to include blanks or special characters between the day, month, year, or time. For more information about date and time values, see “Dates, Times, and Intervals” in SAS Language Reference: Concepts.

When a problem occurs with an informat, SAS writes a note to the SAS log and assigns a missing value to the variable. Problems occur if you use an incompatible informat such as a numeric informat to read character data, or if you specify the width of a date and time informat that causes SAS to read a special character in the last column.
Using Informats

Ways to Specify Informats

Overview of Specifying Informats

You can specify informats in these ways:

- in an INPUT statement
- with the INPUT, INPUTC, and INPUTN functions
- in an INFORMAT statement in a DATA step or a PROC step
- in an ATTRIB statement in a DATA step or a PROC step

INPUT Statement

The INPUT statement with an informat after a variable name is the simplest way to read values into a variable. For example, the following INPUT statement uses two informats:

```
input '@15 style $3. @21 price 5.2;
```

The $w. character informat reads values into the variable STYLE. The w.d numeric informat reads values into the variable PRICE.

For a complete discussion of the INPUT statement, see “INPUT Statement” in SAS DATA Step Statements: Reference.

INPUT Function

The INPUT function converts a SAS character expression using a specified informat. The informat determines whether the resulting value is numeric or character. Thus, the INPUT function is useful for converting data. Here is an example:

```
TempCharacter='98.6';
TemperatureNumber=input(TempCharacter,4.);
```

The INPUT function in combination with the w.d informat converts the character value of TempCharacter to a numeric value and assigns the numeric value 98.6 to TemperatureNumber.

**TIP** If the first argument of the INPUT function is a character expression and not a variable, the character expression must include quotation marks.

Use the PUT function with a SAS format to convert numeric values to character values. For an example of a numeric-to-character conversion, see “PUT Function” in
SAS Functions and CALL Routines: Reference. For a complete discussion of the INPUT function, see “INPUT Function” in SAS Functions and CALL Routines: Reference.

INFORMAT Statement
The INFORMAT statement associates an informat with a variable. SAS uses the informat in any subsequent INPUT statement to read values into the variable. For example, in the following statements, the INFORMAT statement associates the DATEw. informat with the variables Birthdate and Interview:

```
informat Birthdate Interview date9.;
input @63 Birthdate Interview;
```

An informat that is associated with an INFORMAT statement behaves like an informat that you specify with a colon (:) format modifier in an INPUT statement. For information about using the colon (:) modifier, see “INPUT Statement: List” in SAS DATA Step Statements: Reference. Therefore, SAS uses a modified list input to read the variable and ensure that these rules are followed:

- The w value in an informat does not determine column positions or input field widths in an external file.
- The blanks that are embedded in input data are treated as delimiters unless you change the DLM= or DLMSTR= option in an INFILE statement.
- For character informats, the w value in an informat specifies the length of character variables.
- For numeric informats, the w value is ignored.
- For numeric informats, the d value in an informat behaves in the usual way for numeric informats.

If you have coded the INPUT statement to use another style of input such as formatted input or column input, that style of input is not used when you use the INFORMAT statement.

For more information about how to use modified list input to read data, see “INPUT Statement: List” in SAS DATA Step Statements: Reference.

Note: Anytime a text file originates from anywhere other than the local encoding environment, it might be necessary to specify the ENCODING= option in either the ASCII or EBCDIC environment. For example, when you read an EBCDIC text file on an ASCII platform, it is recommended that you specify the ENCODING= option in the FILENAME or INFILE statement. However, if you use the DSD and the DLM= or DLMSTR= options in the FILENAME or INFILE statement, the ENCODING= option is a requirement because these options require certain characters (such as quotation marks, commas, and blanks) in the session encoding. The use of encoding-specific informats should be reserved for use with true binary files (that is, binary files that contain both character and non-character fields).

ATTRIB Statement
The ATTRIB statement can also associate an informat, as well as other attributes, with one or more variables. For example, in the following statements, the ATTRIB statement associates the DATEw. informat with the variables Birthdate and Interview:
attrib Birthdate Interview informat=date9.;
input @63 Birthdate Interview;

An informat that is associated by using the INFORMAT= option in the ATTRIB statement behaves like an informat that you specify with a colon (:) format modifier in an INPUT statement. For details about using the colon (:) modifier, see “INPUT Statement: List” in SAS DATA Step Statements: Reference. Therefore, SAS uses a modified list input to read the variable in the same way as it does for the INFORMAT statement.

For more information, see “ATTRIB Statement” in SAS DATA Step Statements: Reference.

Permanent versus Temporary Association

When you specify an informat in an INPUT statement, SAS uses the informat to read input data values during that DATA step. However, does not permanently associate the informat with the variable. To permanently associate an informat with a variable, use an INFORMAT statement or an ATTRIB statement. SAS permanently associates an informat with the variable by modifying the descriptor information in the SAS data set.

User-Defined Informats

In addition to the informats that are supplied with Base SAS software, you can create your own informats. In Base SAS software, PROC FORMAT enables you to create your own informats and formats for both character and numeric variables. For more information about user-defined informats, see “FORMAT Procedure” in Base SAS Procedures Guide.

When you execute a SAS program that uses user-defined informats, these informats should be available. Here are the two ways to make these informats available:

- create permanent, not temporary, informats with PROC FORMAT
- store the source code that creates the informats (the PROC FORMAT step) with the SAS program that uses them

If you execute a program that cannot locate a user-defined informat, the result depends on the setting of the FMTERR= system option. If the user-defined informat is not found, the following system options produce these results:

<table>
<thead>
<tr>
<th>System Option</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>FMTERR</td>
<td>SAS produces an error that causes the current DATA or PROC step to stop.</td>
</tr>
<tr>
<td>NOFMTERR</td>
<td>SAS continues processing by substituting a default informat.</td>
</tr>
</tbody>
</table>
Although using NOFMTERR enables SAS to process a variable, you lose the information that the user-defined informat supplies. This option can cause a DATA step to misread data, and it can produce incorrect results. For more information, see “FMTERR System Option” in SAS System Options: Reference.

To avoid problems, make sure that users of your program have access to all the user-defined informats that are used.

### Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms

#### Definitions

Integer values for integer binary data are typically stored in one of three sizes: 1 byte, 2 bytes, or 4 bytes. The ordering of the bytes for the integer varies depending on the platform (operating environment) on which the integers were produced.

The ordering of bytes differs between the “big endian” and the “little endian” platforms. These colloquial terms are used to describe byte ordering for IBM mainframes (big endian) and for platforms that are based on Intel (little endian). In SAS, the following platforms are considered big endian: IBM mainframe, HP-UX, AIX, Solaris on SPARC, and Macintosh. In SAS, the following platforms are considered little endian: Intel ABI, Linux, OpenVMS Alpha, OpenVMS Integrity, Solaris on x64, Tru64 UNIX, and Windows.

#### How the Bytes Are Ordered

On big endian platforms, the value 1 is stored in binary and is represented here in hexadecimal notation. One byte is stored as 01, 2 bytes as 00 01, and 4 bytes as 00 00 00 01. On little endian platforms, the value 1 is stored in 1 byte as 01 (the same as big endian), in 2 bytes as 01 00, and in 4 bytes as 01 00 00 00.

If an integer is negative, the two's complement representation is used. The high-order bit of the most significant byte of the integer is set to 0. For example, –2 would be represented in 1, 2, and 4 bytes on big endian platforms as FE, FF FE, and FF FF FF FE, respectively. On little endian platforms, the representation would be FE, FF, and FE FF FF FF. These representations result from the output of the integer binary value –2 expressed in hexadecimal representation.

#### Reading Data Generated on Big Endian and Little Endian Platforms

SAS can read signed and unsigned integers regardless of whether they were generated on a big endian or a little endian platform. Likewise, SAS can write
signed and unsigned integers in both big endian and little endian format. The length of these integers can be up to 8 bytes.

The following table shows which informat to use for various combinations of platforms. In the Sign Integer column, “no” indicates that the number is unsigned and cannot be negative. “Yes” indicates that the number can be either negative or positive.

<table>
<thead>

### Working with Packed Decimal and Zoned Decimal Data

#### Definitions

**Packed decimal**

specifies a method of encoding decimal numbers by using each byte to represent two decimal digits. Packed decimal representation stores decimal data with exact precision. The fractional part of the number is determined by the informat or format because there is no separate mantissa and exponent.

An advantage of using packed decimal data is that exact precision can be maintained. However, computations involving decimal data might become inexact due to the lack of native instructions.

**Zoned decimal**

specifies a method of encoding decimal numbers in which each digit requires 1 byte of storage. The last byte contains the number's sign as well as the last digit. Zoned decimal data produces a printable representation.

**Nibble**

specifies 1/2 of a byte.
Types of Data

Packed Decimal Data

A packed decimal representation stores decimal digits in each “nibble” of a byte. Each byte has two nibbles, and each nibble is indicated by a hexadecimal character. For example, the value 15 is stored in two nibbles, using the hexadecimal characters 1 and 5.

The sign indication is dependent on your operating environment. On IBM mainframes, the sign is indicated by the last nibble. With formats, C indicates a positive value, and D indicates a negative value. With informats, A, C, E, and F indicate positive values, and B and D indicate negative values. Any other nibble is invalid for signed packed decimal data. In all other operating environments, the sign is indicated in its own byte. If the high-order bit is 1, the number is negative. Otherwise, it is positive.

The following information applies to packed decimal data representation:

- You can use the S370FPD format on all platforms to obtain the IBM mainframe configuration.
- You can have unsigned packed data with no sign indicator. The packed decimal format and informat handle the representation. It is consistent between ASCII and EBCDIC platforms.
- Note that the S370FPDU format and informat expect to have an F in the last nibble, whereas packed decimal data expects no sign nibble.

Zoned Decimal Data

The following information applies to zoned decimal data representation:

- A zoned decimal representation stores a decimal digit in the low order nibble of each byte. For all but the byte that contains the sign, the high-order nibble is the numeric zone nibble (F on EBCDIC and 3 on ASCII).
- The sign can be merged into a byte with a digit, or it can be separate, depending on the representation. But the standard zoned decimal format and informat expect the sign to be merged into the last byte.
- The EBCDIC and ASCII zoned decimal formats produce the same printable representation of numbers. There are two nibbles per byte, each indicated by a hexadecimal character. For example, the value 15 is stored in 2 bytes. The first byte contains the hexadecimal value F1 and the second byte contains the hexadecimal value C5.

Packed Julian Dates

The following information applies to packed Julian dates:

- The two formats and informats that handle Julian dates in packed decimal representation are PDJULI and PDJULG. PDJULI uses the IBM mainframe year computation, whereas PDJULG uses the Gregorian computation.
Platforms Supporting Packed Decimal and Zoned Decimal Data

Some platforms have native instructions to support packed and zoned decimal data. Other platforms must use software to emulate the computations. For example, the IBM mainframe has an Add Pack instruction to add packed decimal data, but the platforms that are based on Intel have no such instruction and must convert the decimal data to some other format.

Languages Supporting Packed Decimal and Zoned Decimal Data

Several languages support packed decimal and zoned decimal data. The following table shows how COBOL picture clauses correspond to SAS formats and informats.

<table>
<thead>
<tr>

<td>S370FZDLw.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY SIGN LEADING SEPARATE</td>
<td>S370FZDSw.</td>
</tr>
<tr>
<td>PIC S9(W) DISPLAY SIGN TRAILING SEPARATE</td>
<td>S370FZDTw.</td>
</tr>
</tbody>
</table>

For the packed decimal representation listed in the preceding table, X indicates the number of digits represented, and W is the number of bytes. For PIC S9(X) PACKED-DECIMAL, W is $\text{ceil}((x+1)/2)$. For PIC 9(X) PACKED-DECIMAL, W is $\text{ceil}(x/2)$. For example, PIC S9(5) PACKED-DECIMAL represents five digits. If a sign is included, six nibbles are needed. $\text{ceil}((5+1)/2)$ has a length of 3 bytes, and the value of W is 3.
Note that you can substitute COMP-3 for PACKED-DECIMAL.

In IBM assembly language, the P directive indicates packed decimal data, and the Z directive indicates zoned decimal data. Here is an excerpt from an assembly language list that shows the offset, the value, and the DC statement:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Value (in hex)</th>
<th>Instruction</th>
<th>Label</th>
<th>Directive</th>
</tr>
</thead>
<tbody>
<tr>
<td>+000000</td>
<td>00001C</td>
<td>2 PEX1</td>
<td>DC PL3'1'</td>
<td></td>
</tr>
<tr>
<td>+000003</td>
<td>00001D</td>
<td>3 PEX2</td>
<td>DC PL3'-1'</td>
<td></td>
</tr>
<tr>
<td>+000006</td>
<td>F0F0C1</td>
<td>4 ZEX1</td>
<td>DC ZL3'1'</td>
<td></td>
</tr>
<tr>
<td>+000009</td>
<td>F0F0D1</td>
<td>5 ZEX2</td>
<td>DC ZL3'1'</td>
<td></td>
</tr>
</tbody>
</table>

In PL/I, the FIXED DECIMAL attribute is used in conjunction with packed decimal data. You must use the PICTURE specification to represent zoned decimal data. There is no standardized representation of decimal data for the Fortran or C languages.

---

**Summary of Packed Decimal and Zoned Decimal Formats and Informat**

SAS uses a group of formats and informats to handle packed and zoned decimal data. The following table lists the type of data representation for these formats and informats. Note that the formats and informats that begin with S370 refer to IBM mainframe representation.

<table>
<thead>
<tr>
<th>Format</th>
<th>Data Type Representation</th>
<th>Corresponding Informat</th>

Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations

ISO 8601 Formatting Symbols

The following list explains the formatting symbols that are used to notate the values of the ISO 8601 dates, time, datetime, durations, and interval:

- **n** specifies a number that represents the number of years, months, or days.

- **P** indicates that the duration that follows is specified by the number of years, months, days, hours, minutes, and seconds.

- **T** indicates that a time value follows. Any value with a time must begin with T.

  **Requirement** Time values that are read by the extended notation informats that begin with the characters E8601 must use an uppercase T.

- **W** indicates that the duration is specified in weeks.

- **Z** indicates that the time value is the time in Greenwich, England, or UTC, time.

- **+ | -** the + indicates the time zone offset to the east of Greenwich, England. The - indicates the time zone offset to the west of Greenwich, England.

- **yyyy** specifies a four-digit year.

- **mm** as part of a date, specifies a two-digit month, 01–12.

- **dd** specifies a two-digit day, 01–1.
**hh**
specifies a two-digit hour, 00–24.

**mm**
as part of a time, specifies a two-digit minute, 00–59.

**ss**
specifies a two-digit second, 00–59.

**fff | fffff**
specifies an optional fraction of a second using the digits 0–9:

**fff** uses 1–3 digits for values read by the $N8601B informat and the $N8601E informat.

**ffffff** use 1–6 digits for informats other than the $N8601B and $N8601E informats.

**Y**
indicates that a year value precedes this character in a duration.

**M**
as part of a date, indicates that a month value precedes this character in a duration.

**D**
indicates that a day value precedes this character in a duration.

**H**
indicates that an hour value precedes this character in a duration.

**M**
as part of a time, indicates that a minute value precedes this character in a duration.

**S**
indicates that a seconds value precedes this character in a duration.

---

**Reading ISO 8601 Date, Time, and Datetime Values**

SAS reads ISO 8601 dates, times, and datetimes using various informats, and the resulting values are SAS date, time, or datetime values. The following table shows different date, time, and datetime forms and the informats that you use to read them:

<table>
<thead>
<tr>
<th>Date, Time, or Datetime</th>
<th>ISO 8601 Notation</th>
<th>Example</th>
<th>Informat</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic Notations</strong></td>

</tr>
<tr>
<td>Date from a datetime and no time zone offset</td>
<td><code>yyyyymmdd</code></td>
<td><code>20180915</code></td>
</tr>
</tbody>
</table>

### Extended Notations

<table>
<thead>
<tr>
<th>Date</th>
<th><code>yyyy-mm-dd</code></th>
<th>Example</th>
<th>Informat</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time with no time zone offset</td>
<td><code>hh:mm:ss.nnnnnn</code></td>
<td><code>15:53:00.322348</code></td>
<td>E8601TMw.d</td>
</tr>
<tr>
<td>Time with a time zone offset</td>
<td>`hh:mm:ss.nnnnnn+[</td>
<td>–hh:mm`</td>
<td><code>15:53:00+05:00</code></td>
</tr>
<tr>
<td>Convert to local time with a time zone offset</td>
<td>`hh:mm:ss.nnnnnn+[</td>
<td>–hh:mm`</td>
<td><code>15:53:00+05:00</code></td>
</tr>
<tr>
<td>Datetime with no time zone offset</td>
<td><code>yyyy-mm-ddThh:mm:ss.nnnnnn</code></td>
<td><code>2018-09-15T15:53:00</code></td>
<td>E8601DTw.d</td>
</tr>
<tr>
<td>Datetime with a time zone offset</td>
<td>`yyyy-mm-ddThh:mm:ss.nnnnnn+[</td>
<td>–hh:mm`</td>
<td><code>201809-15T15:53:00+05:00</code></td>
</tr>
<tr>
<td>Date from a datetime and no time zone offset</td>
<td><code>yyyy-mm-dd</code></td>
<td><code>2018-09-15</code></td>
<td>E8601DNw.</td>
</tr>
</tbody>
</table>

When SAS reads an ISO 8601 value that specifies a time zone offset (+|–hh:mm or +|–hhmm), the time or datetime value is adjusted to account for the offset. A SAS time or datetime value for an ISO 8601 value with a time zone offset is the time or datetime for the zero meridian (Greenwich, England). For example, if SAS reads the datetime `2018-09-15T15:53:00+05:00` using the E8601DZ informat, the datetime...
value 1852645980 has been adjusted for the five-hour time zone difference. This datetime value is the datetime value for the zero meridian. If you write this value using the E8601DZ format, the value is 2018–09–15T10:53:00+00:00. The hour specified after the T shows the five-hour adjustment.

For examples of reading ISO 8601 dates, times, and datetimes, see “Examples of Reading and Writing Basic and Extended ISO 8601 Date, Time, and Datetime Values” on page 49.

## Reading ISO 8601 Duration, Interval, and Datetime Values

### Informats That Read Duration, Interval, and Datetime Values

SAS uses two informats that read ISO datetime, duration, and interval values.

- **$N8601B informat** reads duration, interval, and datetime values that are specified in either the basic notation or the extended notation.

- **$N8601E informat** reads duration, interval, and datetime values that are specified only in the extended notation.

Use the $N8601E informat when you want to make sure that you are in compliance with the extended notation.

The datetime values that are read by these informats result in a SAS character representation. If you want a datetime value to be read as a numeric value, use the B8601DT informat, the B8601DZ informat, the E8601DT informat, or the E8601DZ informat.

### Complete Duration, Interval, and Datetime Notations

The following table shows the formatting of duration, datetime, and interval values that can be read in the complete form:

<table>
<thead>
<tr>
<th>Time Component</th>
<th>ISO 8601 Notation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration - Basic Notation</td>
<td>YYYYMMDDThhmmss</td>
<td>P20180915T155300</td>
</tr>
<tr>
<td></td>
<td>–YYYYMMDDThhmmss</td>
<td>–P20180915T155300</td>
</tr>
<tr>
<td>Duration - Extended Notation</td>
<td>YYYY-MM-DDThh:mm:ss</td>
<td>P2018-09-15T15:53:00</td>
</tr>
<tr>
<td></td>
<td>–YYYY-MM-DDThh:mm:ss</td>
<td>–P2018-09-15T15:53:00</td>
</tr>
<tr>
<td>Duration - Basic and Extended Notation</td>
<td>PnYnMnDTnHnMnS</td>
<td>P2y10m14dT20h13m45s</td>
</tr>
</tbody>
</table>
### Time Component

<table>
<thead>
<tr>
<th>ISO 8601 Notation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>–PnYnMnDTnHnMnS</td>
<td>–P2n10m14dT20h13m45s</td>
</tr>
</tbody>
</table>

**PnW (weeks)**

**P6w**

### Interval - Basic Notation

<table>
<thead>
<tr>
<th>YYYYMMDDThhmmss/ YYYYMMDDThhmmss</th>
<th>20180915T155300/20141113T000000</th>
</tr>
</thead>
<tbody>
<tr>
<td>PnYnMnDTnHnMnS/ YYYYMMDDThhmmss</td>
<td>P2y10M14dT20h13m45s/20180915T155300</td>
</tr>
<tr>
<td>YYYYMMDDThhmmss/ PnYnMnDTnHnMnS</td>
<td>20180915T155300/P2y10M14dT20h13m45s</td>
</tr>
</tbody>
</table>

### Interval - Extended Notation

<table>
<thead>
<tr>
<th>YYYY-MM-DDThh:mm:ss/ YYYY-MM-DDThh:mm:ss</th>
<th>2018-09-15T15:53:00/2014-11-13T00:00:00</th>
</tr>
</thead>
<tbody>
<tr>
<td>PnYnMnDTnHnMnS/ YYYY-MM-DDThh:mm:ss</td>
<td>P2y10M14dT20h13m45s/2018-09-15T15:53:00</td>
</tr>
<tr>
<td>YYYY-MM-DDThh:mm:ss/ PnYnMnDTnHnMnS</td>
<td>2018-09-15T15:53:00/P2y10M14dT20h13m45s</td>
</tr>
</tbody>
</table>

### Datetime-Basic Notation

<table>
<thead>
<tr>
<th>YYYYMMDDThhmmss.fff</th>
<th>20180915T155300</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>-hhmm</td>
</tr>
</tbody>
</table>

### Datetime-Extended Notation

<table>
<thead>
<tr>
<th>YYYY-MM-DDThh:mm:ss.fff+</th>
<th>-hhmm</th>
<th>2018-09-15T15:53:00+04:30</th>
</tr>
</thead>
<tbody>
<tr>
<td>(all blank)</td>
<td>(all blank)</td>
<td></td>
</tr>
</tbody>
</table>

## Reading Omitted Components

One or more date or time components can be omitted from a datetime value or a duration value that is in the form Pyyyyymmdd. SAS reads omitted components by using the $N8601B informat or the $N8601E informat, and the omitted component must be represented by a hyphen (-).

The following examples show duration, datetime, and interval values with omitted components:

- **p0003-02--T10:31:33**
  - The omitted component is the number of days.

- **–p0003-02-02T--:31:33**
  - The omitted component is the number of hours.

- **x-09-15T15:x:x**
  - The omitted components are the number of years, minutes, and seconds.
Truncated Values

SAS reads truncated duration, datetime, and interval values, where one or more lower-order components is truncated because the value is 0 or the value is not significant.

The following list shows examples of truncated values:

- p00030202T1031
- 2016-09-15T15/2018-09-15T15:53
- -p0003-03-03T-:-
- P2y3m4dT5h6m
- 2018-09-0T:x:x
- 2018

When reading values that contain a time zone offset, truncation is not allowed. Use 00 in place of truncated values.

Normalizing Duration Components

When a value for a duration component is greater than the largest standard value for a component, SAS normalizes the component except when the duration component is a single component. The following table shows examples of normalized duration components:

<table>
<thead>
<tr>
<th>Duration</th>
<th>Extended Normalized Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>p3y13m</td>
<td>p0004-01</td>
</tr>
<tr>
<td>pt24h24m65s</td>
<td>P----01T-:25:05</td>
</tr>
<tr>
<td>p3y13mT24h61m</td>
<td>P0004-01-01T01:01</td>
</tr>
<tr>
<td>p0004-13</td>
<td>p0005-01</td>
</tr>
<tr>
<td>p0003-02-61T15:61</td>
<td>P0003-04-01T16:02:01</td>
</tr>
<tr>
<td>p13m</td>
<td>P13M</td>
</tr>
</tbody>
</table>

If a component contains the largest value such as 60 for minutes or seconds, SAS normalizes the value and replaces the value with a hyphen. For example, pT12:60:13 becomes PT13:-:-.

Thirty days is used to normalize a month.

Dates and times in a datetime value that are greater than the standard value for the component are not normalized. They produce an error.
Fractions in Duration, Datetime, and Interval Values

Ending components can contain a fraction that consists of a period or a comma, followed by one to three digits. These examples show the use of fractions in values for duration, datetime, and interval:

- 201209.5
- P2012-09-15T10.33
- 2012-09-15/P0003-03-03,333

Informats Documented in Other Publications

Informats by Category

There are seven categories of informats in this list:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAS</td>
<td>instructs SAS to read character data values into character variables in CAS.</td>
</tr>
<tr>
<td>Character</td>
<td>instructs SAS to read character data values into character variables.</td>
</tr>
<tr>
<td>Column Binary</td>
<td>instructs SAS to read data stored in column-binary or multipunched form into character or numeric variables.</td>
</tr>
<tr>
<td>Date and Time</td>
<td>instructs SAS to read date values into variables that represent dates, times, and datetimes.</td>
</tr>
<tr>
<td>ISO 8601</td>
<td>instructs SAS to read date, time, and datetime values that are written in the ISO 8601 standard into either numeric or character variables.</td>
</tr>
</tbody>
</table>
For information about column-binary data, see “Reading Column-Binary Data” in SAS Language Reference: Concepts. For information about creating user-defined informats, see “FORMAT Procedure” in Base SAS Procedures Guide.

The following table provides brief descriptions of the SAS informats. For more detailed descriptions, see the dictionary entry for each informat.

<table>
<thead>
<tr>

## Dictionary

### $ASCIIw. Informat

Converts ASCII character data to native format.

**Categories:**
- CAS
- Character

**Syntax**

$ASCIIw.

**Syntax Description**

- `w` specifies the width of the input field.
Default 1 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

Details

If ASCII is the native format, no conversion occurs.

Comparisons

- On an IBM mainframe system, $ASCIIw. converts ASCII data to EBCDIC.
- On all other systems, $ASCIIw. behaves like the $CHARw. informat, except that the default length is different.

Example

data one;
  input name $ascii3.;
  put name $hex.;
datalines;
  abc
  ABC
  ;
run;

Table 4.1 Output on EBCDIC and ASCII Systems

<table>
<thead>
<tr>
<th>Variable</th>
<th>EBCDIC Results</th>
<th>ASCII Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>abc</td>
<td>818283</td>
<td>818283</td>
</tr>
<tr>
<td>ABC</td>
<td>C1C2C3</td>
<td>414243</td>
</tr>
</tbody>
</table>

Note: The results in this table is hexadecimal representations of codes for characters. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one character value.

$BASE64Xw. Informat

Converts ASCII text to character data by using Base 64 encoding.

Categories: CAS

Character

Alignment: Left
Syntax

\$BASE64Xw.

Syntax Description

\$ \ w

specifies the width of the input field.

Default: 1

Range: 1–32767

Details

Base 64 is an industry encoding method whose encoded characters are determined by using a positional scheme that uses only ASCII characters. Several Base 64 encoding schemes have been defined by the industry for specific uses, such as email or content masking. SAS maps positions 0–61 to the characters A–Z, a–z, and 0–9. Position 62 maps to the character +, and position 63 maps to the character /.

Here are some uses of Base 64 encoding:

- embed binary data in an XML file
- encode passwords
- encode URLs

The '=' character in the encoded results indicates that the results have been padded with zero bits. In order for the encoded characters to be decoded, the '=' must be included in the value to be decoded.

Example

```sas
data _null_;
  B64EXMPL="RkNBMDFBNzk5M0JD";
  B64EXMPL2=input(B64EXMPL, \$base64x64.);
  put B64EXMPL / B64EXMPL2 ;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>B64EXMPL</td>
<td>RkNBMDFBNzk5M0JD</td>
</tr>
<tr>
<td>B64EXMPL2</td>
<td>FCA01A7993BC</td>
</tr>
</tbody>
</table>

See Also

Formats:

- “\$BASE64Xw. Format” on page 101
$\text{BINARY} \ w$. Informat

Converts binary data to character data.

Categories:

- CAS
- Character

Syntax

$\text{BINARY} \ w$.\n
Syntax Description

\(w\)

specifies the width of the input field. Because eight bits of binary information represent one character, every eight characters of input that $\text{BINARY} \ w$. reads become one character value stored in a variable.

If \(w \leq 8\), $\text{BINARY} \ w$. reads the data as \(w\) characters followed by 0s. Thus, $\text{BINARY} \ 4$. reads the characters 0101 as 01010000, which converts to an EBCDIC & or an ASCII P. If \(w > 8\) but is not a multiple of 8, $\text{BINARY} \ w$. reads up to the largest multiple of 8 that is less than \(w\) before converting the data.

Default

8

Range

1–32767

Details

The $\text{BINARY} \ w$. informat does not interpret actual binary data, but it converts a string of characters that contains only 0s or 1s as if it is actual binary information. Therefore, use only the character digits 1 and 0 in the input, with no embedded blanks. $\text{BINARY} \ w$. ignores leading and trailing blanks.

To read representations of binary codes for unprintable characters, enter an ASCII or EBCDIC equivalent for a particular character as a string of 0s and 1s. The $\text{BINARY} \ w$. informat converts the string to its equivalent character value.

Comparisons

- The $\text{BINARY} \ w$. informat reads eight characters of input that contain only 0s or 1s as a binary representation of 1 byte of numeric data.
- The $\text{HEX} \ w$. informat reads hexadecimal characters that represent the ASCII or EBCDIC equivalent of character data.

Example

data one;
   name='0100110001001101';
   name2=input(name,$binary16.);
$CBw. Informat

Reads standard character data from column-binary files.

Syntax

$CBw.

Syntax Description

w

specifies the width of the input field.

Default  1

Range    1–32767

Details

Column-binary data storage compresses data so that more than 80 items of data can be stored on a single "virtual" punch card.

The $CBw. informat reads standard character data from column-binary files, where each card column is represented in 2 bytes. The $CBw. informat translates the data into standard character codes. If the combinations are invalid punch codes, SAS returns blanks and sets the automatic variable _ERROR_ to 1.

Example

The variable is a hexadecimal representation of the column binary. The “virtual” punch card column for the example data has row 12, row 6, and row 8 punched. The binary representation is 0010 0000 0000 1010.

```sas
data _null_
  a=input('200a'x,$cb2.);
  put a=
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>B64EXMPL</td>
<td>RkNBMDFBNzk5M0JD</td>
</tr>
<tr>
<td>put name2;</td>
<td>LM</td>
</tr>
</tbody>
</table>
run;

Table 4.2 Output on EBCDIC and ASCII Systems

<table>
<thead>
<tr>
<th>Variable</th>
<th>EBCDIC Results</th>
<th>ASCII Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>+</td>
<td>N</td>
</tr>
</tbody>
</table>

Informats:
- “CBw.d Informat” on page 555
- “PUNCH.d Informat” on page 605
- “ROWw.d Informat” on page 611

$CHARw. Informat

Reads character data with blanks.

Categories: CAS  
Character

Syntax

$CHARw.

Syntax Description

w specifies the width of the input field.

Default 8 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

Details

The $CHARw. informat does not trim leading and trailing blanks or convert a single period in the input data field to a blank before storing values. If you use $CHARw. in an INFORMAT or ATTRIB statement within a DATA step to read list input, by default SAS interprets any blank embedded within data as a field delimiter, including leading blanks.
Comparisons

- The $CHARw. informat is almost identical to the $w. informat. However, $CHARw. does not trim leading blanks or convert a single period in the input data field to a blank, whereas the $w. informat does.

- Use the following table to compare the SAS informat $CHAR8. with notation in other programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Character Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>$CHAR8.</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>CL8</td>
</tr>
<tr>
<td>C</td>
<td>char [8]</td>
</tr>
<tr>
<td>COBOL</td>
<td>PIC x(8)</td>
</tr>
<tr>
<td>Fortran</td>
<td>A8</td>
</tr>
<tr>
<td>PL/I</td>
<td>CHAR(8)</td>
</tr>
</tbody>
</table>

Example

This example uses the TRANSLATE function to replace specific characters in a character expression. The TRANSLATE function converts the spaces in Name2 to # symbols so that the blanks in the value are more obvious.

```sas
data one;
  name=' X YZ';
  name2=translate(input(name,$char5.),'#',' ');
  put name ;
  put name2 ;
run;
```

The character # represents a blank space.

SAS writes the following output to the log:

```
X YZ
#X#YZ
```

$CHARZBw. Informat

Converts binary 0s to blanks.

Categories: CAS, Character
Syntax

$CHARZBw.

Syntax Description

w
specifies the width of the input field.

Default 1 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

Details

The $CHARZBw. informat does not trim leading and trailing blanks in character data before it stores values.

Comparisons

The $CHARZBw. informat is identical to the $CHARw. informat, except that $CHARZBw. converts any byte that contains a binary 0 to a blank character.

Example

This hexadecimal input string, ‘58595A0000’x, is “XYZ” followed by two null characters. The informat converts the null characters to spaces, indicated by hexadecimal ‘20’x in the output.

```
data a;
  x='58595A0000'x;
  y=input(x,$charzb5.);
  put y=;
  put y=$hex10;
run;
```

SAS writes the following output to the log:

```
y=58595A2020
y=XYZ
```

$EBCDICw. Informat

Converts EBCDIC character data to native format.

Categories: CAS, Character
Syntax

$EBCDICw.$

Syntax Description

\texttt{w} specifies the width of the input field.

\textbf{Default} \hspace{1cm} 1 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

\textbf{Range} \hspace{1cm} 1–32767

Details

If EBCDIC is the native format, no conversion occurs.

\textbf{Note:} Anytime a text file originates from anywhere other than the local encoding environment, it might be necessary to specify the ENCODING= option in either the ASCII or EBCDIC environment. When you read an EBCDIC text file on an ASCII platform, it is recommended that you specify the ENCODING= option in the FILENAME or INFILE statement. However, if you use the DSD and the DLM= or DLMSTR= option in the FILENAME or INFILE statement, the ENCODING= option is required because these options require certain characters (for example, quotation marks, commas, and blanks) in the session encoding. Encoding-specific informats should be reserved for use with true binary files (that is, files that contain both character and non-character fields).

Comparisons

- On an IBM mainframe system, $EBCDICw.$ behaves like the $CHARw.$ informat.
- On all other systems, $EBCDICw.$ converts EBCDIC data to ASCII.

Example

```plaintext
data _null_;  
a=input('qrs',$ebcdic3.);
b=input('QRS',$ebcdic3.);
c=input(':+>',$ebcdic3.);
put a= hex6. b= hex6. c= hex6.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>C9CACB</td>
</tr>
<tr>
<td>b</td>
<td>E9EAEB</td>
</tr>
<tr>
<td>c</td>
<td>8B9A9E</td>
</tr>
</tbody>
</table>
$\text{HEXw. Informat}$

Converts hexadecimal data to character data.

Categories: CAS  
Character

See:  
“$\text{HEX Informat: UNIX}$” in SAS Companion for UNIX Environments  
“$\text{HEXw. Informat: Windows}$” in SAS Companion for Windows

Syntax

$\text{HEXw}.$

Syntax Description

$w$

specifies the number of digits of hexadecimal data.

If $w=1$, $\text{HEXw}$ pads a trailing hexadecimal 0. If $w$ is an odd number that is greater than 1, $\text{HEXw}$ reads $w-1$ hexadecimal characters.

Default 2

Range 1–32767

Details

The $\text{HEXw}$ informat converts every two digits of hexadecimal data to 1 byte of character data. Use $\text{HEXw}$ to encode hexadecimal values into a character variable when your input method is limited to printable characters.

Comparisons

The $\text{HEXw}$ informat reads two digits of hexadecimal data at a time and converts them to 1 byte of numeric data.

Example

```sas
data test;
  name='6C6C';
  name2=input(name,$hex4.);
run;
```
Table 4.3  Output on EBCDIC and ASCII Systems

<table>
<thead>
<tr>
<th>Variable</th>
<th>EBCDIC Results</th>
<th>ASCII Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>6C6C</td>
<td>% %</td>
<td>11</td>
</tr>
</tbody>
</table>

$\text{SN8601Bw.d Informat}$

Reads complete, truncated, and omitted forms of ISO 8601 duration, datetime, and interval values that are specified in either the basic or extended notation.

Categories:  
- CAS  
- Date and Time  
- ISO 8601

Alignment: Left

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.4, complete representation

Syntax

$\text{SN8601B} \text{w.d}$

Syntax Description

$w$

specifies the width of the input field.

Default 50

Range 1–200

Requirement The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.

$d$

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0

Range 0–6

Details

The $\text{SN8601B}$ informat reads ISO 8601 duration, interval, and datetime values as character data for these basic notations:
The $N8601B informat also reads ISO 8601 duration, interval, and datetime components that contain omitted or truncated components. Omitted components must use a single hyphen ( - ) to represent the component.

Note: Using a month value that is greater than 12 with a datetime value causes an error. For example, the value 20121415T000000/2014-09-15T00:00:00 causes an error because the value for the month is 14.

**Comparisons**

The $N8601B informat reads durations, intervals, and datetimes that are specified in either the basic or extended notation.

The $N8601E informat reads durations, intervals, and datetimes that are specified only in the extended notation. Use the $N8601E informat when you need to ensure compliance with the extended notation.

**Example**

The resulting value of Date2 can be formatted so that it is displayed like Date with the $N8601E format.

```plaintext
data one;
```
date='2018-09-15T15:53:00';
dt2=input(date,$n8601b20.);

put dt2 /
    dt2=$N8601E.;
run;

SAS writes the following output to the log:

```
2018915155300FFD
dt2=2018-09-15T15:53:00
```

---

$N8601Ew.d Informat

Reads ISO 8601 duration, datetime, and interval values that are specified in the extended notation.

Categories:
- CAS
- Date and Time
- ISO 8601

Alignment: Left

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.4, complete representation

Syntax

$N8601Ew.d

Syntax Description

\( w \)

specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–200</td>
</tr>
</tbody>
</table>

Requirement: The minimum length for a duration value or a datetime value is 16. The minimum length for an interval value is 16.

\( d \)

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>0–3</td>
</tr>
</tbody>
</table>
Details

The $N8601E informat reads ISO 8601 duration, interval, and datetime values that can be specified in these extended notations:

<table>
<thead>
<tr>
<th>Time Component</th>
<th>ISO 8601 Notation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Pyyyy-mm-ddThh:mm:ss.fff</td>
<td>P2012-09-15T15:53:00</td>
</tr>
<tr>
<td></td>
<td>PnW</td>
<td>P6w</td>
</tr>
<tr>
<td>Interval</td>
<td>yyyy-mm-ddThh:mm:ss.fff/ yyyy-mm-ddThh:mm:ss.fff</td>
<td>2012-09-15T15:53:00/201</td>
</tr>
<tr>
<td></td>
<td>yyyy-mm-ddThh:mm:ss.fff/ PnYnMnDTnHnMns.fffS</td>
<td>2012-09-15T15:53:00/ P2Y10M14DT20H13M45S</td>
</tr>
<tr>
<td>Datetime</td>
<td>yyyy-mm-ddThh:mm:ss.fff</td>
<td>2012-09-15T15:53:00</td>
</tr>
</tbody>
</table>

- \( n \)
  - specifies a number that represents the number of years, months, or days.
- \( P \)
  - is the character that is used to indicate that the duration that follows is specified by the number of years, months, days, hours, minutes, and seconds.
- \( W \)
  - is the character that is used to designate that the duration is specified in weeks.
- \( T \)
  - is the character that is used to designate that a time value follows. If all time values are 0, \( T \) is not required.
- \(/\)
  - in an interval, is used to separate the beginning and ending datetime values.
- \( yyyy \)
  - specifies a four-digit year.
- \( mm \)
  - specifies a two-digit month between 01 and 12.
- \( dd \)
  - specifies a two-digit day between 01 and 31.
- \( hh \)
  - specifies a two-digit hour between 00 and 23.
- \( mm \)
  - specifies a two-digit minute between 00 and 59.
- \( ss \)
  - specifies a two-digit second between 00 and 59.
- \( fff \)
  - specifies an optional fraction of a second with a precision of up to three digits, where each digit is between 0 and 9.
is the character that is used to designate years in a duration.

M
is the character that is used to designate months in a duration.

D
is the character that is used to designate days in a duration.

H
is the character that is used to designate hours in a duration.

M
is the character that is used to designate minutes in a duration.

S
is the character that is used to designate seconds in a duration.

Comparisons
The $N8601E informat reads valid durations, intervals, and datetimes that are specified only in the extended notation.

The $N8601B informat reads valid durations, intervals, and datetimes that are specified in either the basic or extended notation.

Use the $N8601E informat when you need to ensure compliance with the extended notation.

Example
The resulting value of Date2 can be formatted so that it is displayed like Date with the $N8601E format.

```sas
data one;
  date='2018-09-15T15:53:00';
  date2=input(date,$n8601e20.);

  put date2 /
    date2=$N8601E.;
run;
```

SAS writes the following output to the log:

```
2012915155300FFD
date2=2018-09-15T15:53:00
```

$OCTALw. Informat
Converts octal data to character data.

Categories: CAS
Character

Syntax

$OCTALw$

Syntax Description

w specifies the width of the input field in bits. Because one digit of octal data represents three bits of binary information, increment the value of w by three for every column of octal data that $OCTALw$ reads.

Default 3

Range 1–32767

Details

Eight bits of binary data represent the code for one digit of character data. Therefore, you need at least three digits of octal data to represent one digit of character data, which includes an extra bit. $OCTALw$ treats every three digits of octal data as one digit of character data, ignoring the extra bit.

Use $OCTALw$ to read octal representations of binary codes for unprintable characters. Enter an ASCII or EBCDIC equivalent for a particular character in octal notation. Then use $OCTALw$ to convert the octal notation to its equivalent character value.

Use only the digits 0 through 7 in the input, with no embedded blanks. $OCTALw$ ignores leading and trailing blanks.

Comparisons

The OCTALw informat reads octal data and converts it to the numeric equivalents.

Example

```sas
data _null_;  
a=input('141162164040040', $octal15.);  
b=input('162151143145040', $octal15.);  
c=input('142141156153040', $octal15.);  
put a= b= c=;  
run;
```

SAS writes the following output to the log:

```
a=art b=rice c=bank
```
$PHEXw. Informat

Converts packed hexadecimal data to character data.

Categories: CAS
Character

Syntax

$PHEXw.

Syntax Description

w

specifies the number of bytes in the input.

When you use $PHEXw. to read packed hexadecimal data, the length of the variable is the number of bytes that are required to store the resulting character value, not w. In general, a character variable whose length is implicitly defined with $PHEXw. has a length of 2w–1.

Default 2

Range 1–32767

Details

Packed hexadecimal data is like packed decimal data, except that all hexadecimal characters are valid. In packed hexadecimal data, the value of the low-order nibble has no meaning. In packed decimal data, the value of the low-order nibble indicates the sign of the numeric value that the data represents. The $PHEXw. informat returns a character value and treats the value of the sign nibble as if it were X'F', regardless of its actual value.

Comparisons

The PDw.d. informat reads packed decimal data and converts it to numeric data.

Example

data _null_
  a=input('0001111000001111','$phex.);
  put a=;
run;

SAS writes the following to the log:

a=303
$QUOTEw. Informat

Removes matching quotation marks from character data.

Categories:
- CAS
- Character

Syntax

$QUOTEw.

Syntax Description

-w specifies the width of the input field.

Default 8 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

Example

data one;
    name='SAS';
    name2=input(name,$quote7.);
    put name2 = ;
run;

SAS writes the following output to the log:

name2=SAS

$UPCASEw. Informat

Converts character data to uppercase.

Categories:
- CAS
- Character

Syntax

$UPCASEw.

Syntax Description

-w specifies the width of the input field.
Default  8 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range  1–32767

Details
Special characters, such as hyphens, are not altered.

Example

```
data test;
  name='sas';
  name2=input(name,$upcase.);
  put name2 ;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>sas</td>
<td>SAS</td>
</tr>
</tbody>
</table>

$UUIDw. Informat
Converts a Universally Unique Identifier (UUID) to binary data.

Syntax

```
$UUIDw.
```

Arguments

\( w \)

specifies the width of the input field.

Range  1–36

Details

The input for the informat should be a character representation of a UUID. That representation consists of eight hexadecimal characters, a hyphen, four hexadecimal digits, a hyphen, four hexadecimal characters, a hyphen, and twelve hexadecimal characters. A total of thirty-two hexadecimal characters convert to 16 binary bytes. The input typically uses lowercase for the hexadecimal characters a–f, although the characters can be uppercase. Leading or trailing blanks are acceptable, but there must be thirty-six continuous characters between blanks.
Example

```sas
data _null_;
  length x $16;
  x = input('1548611f-b8cb-6a47-a721-a6fd284e74f2',$uuid36.);
  put x $hex.;
run;
```

SAS writes the following output to the log:

```
1548611F8CB6A47A721A6FD284E74F2
```

$VARYINGw. Informat

Reads character data of varying length.

Categories:

<table>
<thead>
<tr>
<th>CAS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character</td>
</tr>
</tbody>
</table>

Syntax

$VARYINGw. length-variable

Syntax Description

`w`

specifies the maximum width of a character field for all the records in an input file.

Default 8 if the length of the variable is undefined. Otherwise, the default is the length of the variable.

Range 1–32767

`length-variable`

specifies a numeric variable that contains the width of the character field in the current record. SAS obtains the value of `length-variable` by reading it directly from a field that is described in an INPUT statement or by calculating its value in the DATA step.

Restriction `Length-variable` cannot be an array reference.

Requirement You must specify `length-variable` immediately after $VARYINGw. in an INPUT statement.

Tips

If the value of `length-variable` is negative or missing, SAS reads no data from the corresponding record.

If the value of `length-variable` is 0, the value of the variable is a blank character. A value of 0 for `length-variable` enables you to read zero-length records and fields.
If a variable has been read using an informat other than the $VARYING. informat, and then the same data is read into the same variable that uses the $VARYING. informat where \textit{length-variable} is 0, then the previous value is overwritten with a blank value.

If \textit{length-variable} is greater than 0 but less than \textit{w}, SAS reads the number of columns that are specified by \textit{length-variable}. Then, SAS pads the value with trailing blanks up to the maximum width that is assigned to the variable.

If \textit{length-variable} is greater than or equal to \textit{w}, SAS reads \textit{w} columns.

Details

Use $VARYINGw. when the length of a character value differs from record to record. After reading a data value with $VARYINGw., the pointer's position is set to the first column after the value.

Examples:

Example 1: Obtaining a Current Record Length Directly

```sas
data one;
  input fwidth 1. name $varying9. fwidth;
  put name;
  datalines;
  5shark
  3sunfish
  8bluefish
; run;
```

SAS writes the following to the log.

```
shark
sun
bluefish
```

\textbf{Note:} The result of the second variable, \texttt{3sunfish}, is truncated.

Example 2: Obtaining a Current Record Length Indirectly

Use the LENGTH= option in the INFILE statement to obtain a record length indirectly. The input variables and results follow the explanation of the SAS statements.

```sas
data one;
  infile file-specification length=reclen;
  input @;
  fwidth=reclen-9;
  input name $ 1-9
    @10 class $varying20. fwidth;
```
The LENGTH= option in the INFILE statement assigns the internally stored record length to RECLEN when the first INPUT statement executes. The trailing @ holds the record for another INPUT statement. Next, the assignment statement calculates the value of the varying-length field by subtracting the fixed-length portion of the record from the total record length. The variable FWIDTH contains the length of the last field and becomes the length-variable argument to the $VARYING20. informat.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATEL</td>
<td>CHEMISTRY</td>
</tr>
<tr>
<td>JOHNSON</td>
<td>GEOLOGY</td>
</tr>
<tr>
<td>WILCOX</td>
<td>ART</td>
</tr>
</tbody>
</table>

$w. Informat
Reads standard character data.
Categories: CAS
Character
Alias: $Fw.

Syntax
$w.

Syntax Description

w
specifies the width of the input field. You must specify w because SAS does not supply a default value.

Range 1–32767

Details
The $w. informat trims leading blanks and left-aligns the values before storing the text. In addition, if a field contains only blanks and a single period, $w. converts the period to a blank because it interprets the period as a missing value. The $w. informat treats two or more periods in a field as character data.
Comparisons

The  informat is almost identical to the $CHARw. informat. However, $CHARw. does not trim leading blanks nor does it convert a single period in an input field to a blank, whereas $w. does both.

Example

This example truncates the leading blanks on the name statement.

```
data one;
  name='  XYZ';
  name2=input(name,$5.);
  put name2;
run;
```

SAS writes the following output to the log:

```
XYZ
```

ANYDTDTEw. Informat

Reads and extracts the date value from various date, time, and datetime forms.

**Categories:**  CAS  
Date and Time

**Restriction:**  Do not use a period (.) as a separator in the date part or between the date and time parts of date-time values. SAS might consider a period to be an invalid separator in the date part of ANYDTDTE values when running in certain environments. The time part of the date-time value can contain a period. For example, 01JAN2018 14:30:08.5 is a valid date-time value that contains a period in the time part.

**Syntax**

```
ANYDTDTEw.
```

**Syntax Description**

w  
  specifies the width of the input field.

  **Default**  9  
  **Range**  5–60

**Details**

The ANYDTDTE informat reads input data that corresponds to any of the following informats or date, time, or datetime forms. Then, the informat extracts the date part from the derived value.
### Informat or Form of Input

<table>
<thead>
<tr>
<th>Informat or Form of Input</th>
<th>Example Data</th>

<td>01-01-18 3:53 pm</td>
<td>YYQ</td>
<td>18Q1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>2018Q1</td>
</tr>
<tr>
<td>MMDDYY</td>
<td>010118</td>
<td>YY&lt;YY&gt;xMM  ¹</td>
<td>18/01</td>
</tr>
<tr>
<td></td>
<td>01012018</td>
<td></td>
<td>2018-01</td>
</tr>
<tr>
<td>MMxYY&lt;YY&gt;  ¹</td>
<td>01/18</td>
<td>month-day-year</td>
<td>January 1, 2018</td>
</tr>
<tr>
<td></td>
<td>01-2018</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

¹ x is a special character that separates the month from the year.

If the input value is a time-only value, SAS assumes a date of 01JAN1960.

It is possible for input data such as 01-02-03 or 01-02 to be ambiguous with respect to the month, day, and year. In this case, the DATESTYLE system option indicates the order of the month, day, and year.

Input data that contains colons is interpreted as time data. For example, 2013:12 is interpreted as 2013 hours and 12 minutes, not as the year 2013 and the month 12. The date result of reading a time value is 0.

### Comparisons

The ANYDTDTE informat extracts the date part from the derived value. The ANYDTDTM informat extracts the datetime part. The ANYDTTME informat extracts the time part.

### Example

```sas
data test;
  dateinfo='01JAN2018 14:30:08.5';
  sasdate=input(dateinfo,anydtdte21.);
  put sasdate;
  put sasdate date9.;
run;
```
SAS writes the following output to the log.

```
21185
01JAN2018
```

**ANYDTDTMw. Informat**

Reads and extracts datetime values from various date, time, and datetime forms.

**Categories:**
- CAS
  - Date and Time

**Restriction:**
Do not use a period (.) as a separator in the date part or between the date and time parts of date-time values. SAS might consider a period to be an invalid separator in the date part of ANYDTDTM values when running in certain environments. The time part of the date-time value can contain a period. For example, 01JAN2018 14:30:08.5 is a valid date-time value that contains a period in the time part.

**Interaction:**
If an input datetime value contains a special character for formatting characters and the character is not B, C, N, P, or S, the ANYDTDTMw. informat reads only the date portion of the input and the time is set to 0. For example, for an EN_US locale, an input value of '150501X1' results in 01MAY15:00:00:00.

**Syntax**

```
ANYDTDTMw.
```
## Syntax Description

**w**

specifies the width of the input field.

- **Default**: 19
- **Range**: 1–60

## Details

The ANYDTDTM informat reads data that is in the form of any of the following informats or datetime forms. Then, the format extracts the datetime part from the derived value:

<table>
<thead>
<tr>
<th>Informat or Form of Input</th>
<th>Example Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>01JAN18</td>
</tr>
<tr>
<td></td>
<td>01JAN2018</td>
</tr>
<tr>
<td>DATETIME</td>
<td>01JAN18 14:30:08</td>
</tr>
<tr>
<td></td>
<td>01JAN2018 14:30:08.5</td>
</tr>
<tr>
<td>DDMM&lt;YY&gt;YY</td>
<td>010118</td>
</tr>
<tr>
<td></td>
<td>01012018</td>
</tr>
<tr>
<td>JULIAN</td>
<td>18001</td>
</tr>
<tr>
<td></td>
<td>2018001</td>
</tr>
<tr>
<td>MMDD&lt;YY&gt;YY</td>
<td>010118</td>
</tr>
<tr>
<td></td>
<td>01012018</td>
</tr>
<tr>
<td>MMx&lt;YY&gt;YY</td>
<td>01/18</td>
</tr>
<tr>
<td></td>
<td>01-2018</td>
</tr>
<tr>
<td>MDYAMPM</td>
<td>01/01/18 02:30:08 AM</td>
</tr>
<tr>
<td></td>
<td>01/01/2018 02:30:08 AM</td>
</tr>
<tr>
<td>MONYY</td>
<td>JAN18</td>
</tr>
<tr>
<td></td>
<td>JAN2018</td>
</tr>
<tr>
<td>TIME</td>
<td>14:30</td>
</tr>
<tr>
<td></td>
<td>14:30:08.05</td>
</tr>
<tr>
<td>&lt;YY&gt;YYMMDD</td>
<td>180101</td>
</tr>
<tr>
<td></td>
<td>20180101</td>
</tr>
<tr>
<td>&lt;YY&gt;YYQ</td>
<td>18Q1</td>
</tr>
</tbody>
</table>
**Informat or Form of Input**  |  **Example Data**
--- | ---
2018Q1 |
<YY>YYxMM | 18/01
 | 2018/01

*month-day-year* | January 1, 2018

*month-day-year hh:mm:ss* | January 1, 2018 12:00:00

1. *x* is a special character that separates the month from the year.
2. *<YY>* indicates the century is optional.
3. If the month and day values are ambiguous, the value for the DATESTYLE= system option is used to determine the order.

If the input value is a time-only value, SAS assumes a date of 01JAN1960. If the input value is a date-only value, SAS assumes a time of 12:00 midnight. Input time values must include hours and minutes. If any part of a date in the input value is missing in the input value, or if the hour and minutes in a time value are missing or out of range, the value read is a SAS missing value.

The input values for the preceding informats are mutually exclusive except for MMDDYY, DDMMYY, or YYMMDD when two-digit years are used. It is possible for input data such as 01-02-03 or 01-02 to be ambiguous with respect to the month, day, and year. In this case, the DATESTYLE system option indicates the order of the month, day, and year.

The ANYDTTME informat uses these rules when reading colons and periods in time values:

**Use of Colons and Periods**  |  **Example**
--- | ---
A single colon in the value h:m indicates hours and minutes. | 14:30
Two colons in the value h:m:s indicate hours, minutes, and seconds. | 14:30:08
A single period in the value m:s.ff, where ff is a fraction of a second, indicates that the number preceding the period is the number of seconds. | 2:39.66
Multiple periods in the value indicate that the period is a delimiter for dates and the value is not a time value. | 12.25.2018

**Comparisons**
The ANYDTDTE informat extracts the date part from the derived value. The ANYDTDTM informat extracts the datetime part. The ANYDTTME informat extracts the time part.
Example

data test;
  dateinfo='01JAN2018 14:30:08.5';
  sasdt=input(dateinfo,anydtdtm21.);
  put sasdt ;
  put sasdt datetime20.;
run;

SAS writes the following output to the log:

1830436208.5
01JAN2018:14:30:09

B8601Clw.d Informat

Reads an IBM date and time value that includes a century marker, in the form cyymmddhhmmss<fff>.

Categories: Date and Time
ISO 8601

Alignment: Left

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

\texttt{B8601Clw.d}

Syntax Description

\texttt{w}

specifies the width of the input field.

- Default: 16
- Range: 10–26

\texttt{d}

specifies the number of digits to the right of the decimal point in the seconds value.

- Default: 0
- Range: 0–6

Details

The B8601Cl informat reads time values that are specified in the IBM time notation cyymmddhhmmss<fff>.

\texttt{c}

is a single digit that represents a century.

\textbf{Table 4.4} Digits and Represented Centuries

<table>
<thead>
<tr>

</table>
### Digit

<table>
<thead>
<tr>
<th>Digit</th>
<th>Century</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{n} )</td>
<td>indicates the years 00–99 in a century that is determined by performing a calculation on a year greater than 2199. To determine the century marker, subtract 1900 from the year and divide the result by 100. Discard the remainder. The remaining integer is the century marker. For example, to determine the century marker for the year 2382, perform this calculation: ((2382–1900)/100=4.82). Discard .82. The century marker is 4.</td>
</tr>
</tbody>
</table>

\( \text{yy} \) is a two-digit year between 00 and 99.

\( \text{mm} \) is a two-digit month (zero padded) between 01 and 12.

\( \text{dd} \) is a two-digit day of the month (zero padded) between 01 and 31.

\( \text{hh} \) is a two-digit hour (zero padded) between 00 and 23.

\( \text{mm} \) is a two-digit minute (zero padded) between 00 and 59.

\( \text{ss} \) is a two-digit second (zero padded) between 00 and 59.

\( \text{fff} \) are optional fractional seconds, with a precision of up to three digits, where each digit is between 0 and 9.

**Example**

```sas
data one;
  date='118100112153025';
  date2=input(date,B8601CI.);
  put date2 /
      date2 datetime25.2;
run;
```

SAS writes the following output to the log:

```
1854015330.3
01OCT2018:12:15:30.25
```

### B8601DAw. Informat

Reads date values that are specified using the ISO 8601 base notation yyyyymmdd.
Syntax

**B8601DAw.**

Syntax Description

\( w \)

specifies the width of the input field.

Default: 10

Requirement: The width of the output field must be 10.

Details

The B8601DA informat reads date values that are specified using the ISO 8601 basic date notation `yyyymmdd`.

- `yyyy` is a four-digit year.
- `mm` is a two-digit month (zero padded) between 01 and 12.
- `dd` is a two-digit day of the month (zero padded) between 01 and 31.

If the month or day values are omitted, SAS uses a value of 1 for the month or day. If the hour, minute, or second values are omitted, SAS uses a value of 0 for the hour, minute, or second.

Example

```sas
data _null_
  input d b8601da.;
  put d;
  datalines;
20180915
2018
; run;
```

SAS writes the following to the log.

```
21442
21185
```
See Also
“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

B8601DJw.d Informat
Reads a Java date and time value that is in the form yyyymmddhhmss<ffffff>.

Categories: Date and Time
ISO 8601
Alignment: Left
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax
B8601DJw.d

Syntax Description
w
specifies the width of the input field.
Default 16
Range 10–26

d
specifies the number of digits to the right of the decimal point in the seconds value.
Default 0
Range 0–6

Details
The B8601DJw.d informat reads a date and time value that is specified using the Java date and time notation yyyymmddhhmss<ffffff>.

yyyy
is a four-digit year between 0000 and 9999.

mm
is a two-digit month (zero padded) between 01 and 12.

dd
is a two-digit day of the month (zero padded) between 01 and 31.

hh
is a two-digit hour (zero padded) between 00 and 23.

mm
is a two-digit minute (zero padded) between 00 and 59.
ss
  is a two-digit second (zero padded) between 00 and 59.

ffffff
  are optional fractional seconds, with a precision of up to six digits, where each
digit is between 0 and 9.

Comparisons

The B8601DJw.d informat reads a date and time value that does not include a T to
separate the date from the time.

Java date and time values do not include a T. For example, the date September 1,
2018 at 7:30:00.33 a.m. is written as 2018090107300033.

ISO 8601 date and time values include a T. For example, the date September 1,
2018 at 7:30:00.33 a.m. is written as 20180901T07300033.

Example

data one;
  date='2018090107300033';
  date2=input(date,B8601DJ.);
  put datetm2 /
      datetm2 datetime25.2;
run;

SAS writes the following output to the log:

<table>
<thead>
<tr>
<th>1851406200.3</th>
</tr>
</thead>
<tbody>
<tr>
<td>01SEP2018:07:30:00.33</td>
</tr>
</tbody>
</table>

B8601DNw. Informat

Reads date values that are specified using the ISO 8601 basic notation yyyymmdd and returns SAS
datetime values where the time portion of the value is 000000.

Categories:  Date and Time
             ISO 8601

Alignment:  Left

Alias:  ND8601DNw

Restrictions:  This informat is not supported in a DATA step that runs in CAS.
               UTC time zone offset values are not supported.

Supports:  ISO 8601 Element 5.2.1.1, complete representation

Syntax

B8601DNw.
Syntax Description

w
  specifies the width of the input field.
  Default  10
  Requirement  The width of the input field must be 10.

Details

The B8601DN informat reads date values that are specified using the ISO 8601
basic date notation yyyyymmdd and returns the date in a SAS datetime value.

yyyy
  is a four-digit year.

mm
  is a two-digit month (zero padded) between 01 and 12.

dd
  is a two-digit day of the month (zero padded) between 01 and 31.

Example

data one;
  date='20180915';
  datetm=input(date,B8601DN.);
  put datetm /
       datetm datetime20.;
run;

SAS writes the following output to the log:

1852588800
15SEP2018:00:00

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations”
on page 487

B8601DTw.d Informat

Reads datetime values that are specified using the ISO 8601 basic notation yyyyymmddThhmmss<ffffff>.

Categories:  Date and Time
             ISO 8601

Alignment:  Left

Aliases:  B8601LXw.d
          ND8601DTw.d

Restrictions:  This informat is not supported in a DATA step that runs in CAS.
              UTC time zone offset values are not supported.
Syntax

**B8601DT**\(w.d\)

Syntax Description

- **w** specifies the width of the input field.
  - Default: 19
  - Range: \(14–26\)

- **d** specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.
  - Default: 0
  - Range: \(0–6\)

Details

The B8601DT informat reads datetime values that are specified in the ISO 8601 basic datetime notation \(yyyy\text{mmdd}Thhmmss<ffffff>\).

- **yyyy** is a four-digit year.
- **mm** is a two-digit month (zero padded) between 01 and 12.
- **dd** is a two-digit day of the month (zero padded) between 01 and 31.
- **hh** is a two-digit hour (zero padded) between 00 and 23.
- **mm** is a two-digit minute (zero padded) between 00 and 59.
- **ss** is a two-digit second (zero padded) between 00 and 59.
- \(ffffff\) are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

If the month or day values are omitted, SAS uses a value of 1 for the month or day. If the hour, minute, or second values are omitted, SAS uses a value of 0 for the hour, minute, or second.

Example

```plaintext
data _null_;  
  input d b8601dt.;  
  put d;  
```
SAS writes the following to the log.

<table>
<thead>
<tr>
<th>1852645980</th>
</tr>
</thead>
<tbody>
<tr>
<td>1830384000</td>
</tr>
</tbody>
</table>

B8601DXw. Informat

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, reads the local date and time by using the ISO 8601 datetime and time zone basic notation \texttt{yyyyymmdd}T\texttt{hhmmss} +|-\texttt{hhmm}

Restriction: This informat is not supported in a DATA step that runs in CAS.

See: The B8601DXw. informat uses the B8601DZw.d informat to read data. See "B8601DZw.d Informat" on page 546.

Syntax

\texttt{B8601DXw.}

B8601DZw.d Informat

Reads Coordinated Universal Time (UTC) datetime values that are specified using the ISO 8601 datetime basic notation \texttt{yyyyymmdd}T\texttt{hhmmss} +|-\texttt{hhmm} or \texttt{yyyyymmdd}T\texttt{hhmmss}<ffffff>Z.

Categories: Date and Time

ISO 8601

Alignment: Left

Aliases: B8601DXw.d

ND8601DZw.d

Restrictions: This informat is not supported in a DATA step that runs in CAS.

UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.1, complete representation
Syntax

B8601DZw.d

Syntax Description

w
specifies the width of the input field.

Default 26
Range 15–35

d
specifies the number of digits to the right of the seconds value, which represents a fraction of a second. This argument is optional.

Default 0
Range 0–6

Details

UTC values specify a time and a time zone based on the zero meridian in Greenwich, England. The B8601DZ informat reads datetime values that are specified in one of these ISO 8601 basic datetime notations:

- yyyyymmddThhmmss+|–hhmm
- yyyyymmddThhmmss<ffffff>Z

yyyy
is a four-digit year.

mm
is a two-digit month (zero padded) between 01 and 12.

dd
is a two-digit day of the month (zero padded) between 01 and 31.

hh
is a two-digit hour (zero padded) between 00 and 24.

mm
is a two-digit minute (zero padded) between 00 and 59.

ss
is a two-digit second (zero padded) between 00 and 59.

ffffff
are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

+|–hhmm
is an hour and minute signed offset from zero meridian time. Note that the offset must be +|–hhmm (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.
Restriction: The shorter form +|–hh is not supported.

Z indicates that the time is for zero meridian (Greenwich, England) or +0000 UTC.

Example

data one;
  input d b8601dz.;
  put d;
  put d datetime.;
  datalines;
20180915T155300+0500
 ;
run;

SAS writes the following output to the log:

| 1852627980 |
| 15SEP18:10:53:00 |

See Also

"Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 487

B8601LXw. Informat

Reads datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 basic notation yyyyymmdThhmmss+|–hhmm.

Restriction: This informat is not supported in a DATA step that runs in CAS.

See: The B8601LXw.d informat uses the B8601DTw.d informat to read data. See "B8601DTw.d Informat" on page 544.

Syntax

B8601LXw.d

B8601TMw.d Informat

Reads time values that are specified using the ISO 8601 basic notation hhmmss<ffffff>.

Categories: Date and Time
ISO 8601

Alignment: Left

Alias: ND8601TMw.d

Restrictions: This informat is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

Supports: ISO 8601 Elements 5.3.1.1 and 5.3.1.3, complete representation and representation of decimal fractions

Syntax

**B8601TM**\(w.d\)

Syntax Description

\(w\)

specifies the width of the input field.

Default 8

Range 6–15

\(d\)

specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0

Range 0–6

Details

The B8601TM informat reads time values that are specified using the ISO 8601 basic time notation \(hhmmss<fffff>\):

\(hh\)

is a two-digit hour (zero padded) between 00 and 23.

\(mm\)

is a two-digit minute (zero padded) between 00 and 59.

\(ss\)

is a two-digit second (zero padded) between 00 and 59.

\(fffff\)

are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

Example

```sas
data one;
  input d b8601tm.;
  put d;
  datalines;
  155300
run;
```

SAS writes the following output to the log:

57180
B8601TXw. Informat

Adjusts a Coordinated Universal Time (UTC) value to the user’s local time. Then, reads the local time by using the ISO 8601 basic time notation \( hhmmss \pm hhmm \).

Restriction: This informat is not supported in a DATA step that runs in CAS.

See: The B8601TXw. informat uses the B8601TZw.d informat to read data. See “B8601TZw.d Informat” on page 550.

Syntax

\[
B8601TXw. 
\]

B8601TZw.d Informat

Reads time values that are specified using the ISO 8601 basic time notation \( hhmmss<ffffff> \pm hhmm \) or \( hhmmss<ffffff>Z \).

Categories: Date and Time
ISO 8601

Alignment: Left

Aliases: B8601TXw.d
ND8601TZw.d

Restrictions: This informat is not supported in a DATA step that runs in CAS.
UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.3.1.1, complete representation

Syntax

\[
B8601TZw.d 
\]

Syntax Description

\[
w
\]

specifies the width of the input field.

Default 14

Range 7–20
(optional) specifies the number of digits to the right of the decimal point in the seconds value.

**Default**: 0  
**Range**: 0–6

### Details
UTC time values specify a time and a time zone based on the zero meridian in Greenwich, England. The B8601TZ informat reads time values that are specified in these ISO 8601 basic time notations:

- `hhmmss<ffffff>+|–hhmm`
- `hhmmss<ffffff>Z`

- **hh**
  is a two-digit hour (zero padded) between 00 and 23.

- **mm**
  is a two-digit minute (zero padded) between 00 and 59.

- **ss**
  is a two-digit second (zero padded) between 00 and 59.

- **ffffff**
  are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

- **+|–hh:mm**
  is an hour and minute signed offset from zero meridian time. Note that the offset must be `+|–hhmm` (that is, + or – and four characters).

  Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

  **Restriction**: The shorter form `+|–hh` is not supported.

- **Z**
  indicates that the time is for zero meridian (Greenwich, England) or +0000 UTC time.

When SAS reads a UTC time by using the B8601TZ informat and the adjusted time is greater than 240000 or less than 000000, SAS adjusts the time value so that the time is between 000000 and 240000. For example, if SAS reads the UTC time `234344–0500` using the B8601TZ informat, SAS adds five hours to the time so that the value is 284344, and then makes the time adjustment. The value stored represents the time 044344+0000.

### Example
```plaintext
data _null_;  
  input d b8601tz.;  
  put d= d=time8.;;  
datalines;  
202401-0500  
202401Z  
```
202401+0000un;

SAS writes the following output to the log:

d=5041  d=1:24:01
d=73441 d=20:24:01
d=73441 d=20:24:01

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

BINARYw.d Informat

Converts positive binary values to integers.

Categories:

CAS
Numeric

Syntax

**BINARYw.d**

Syntax Description

**w**

specifies the width of the input field.

Default 8

Range 1–64

**d**

specifies the power of 10 by which to divide the value. SAS uses the d value even if the data contains decimal points. This argument is optional.

Range 0–31

Details

Use only the character digits 1 and 0 in the input, with no embedded blanks. BINARYw.d ignores leading and trailing blanks.

BINARYw.d cannot read negative values. It treats all input values as positive (unsigned).

Example

```plaintext
data one;
  input @1 value binary8.1;
```
BITSw.d Informat

Extracts bits.

Categories: CAS
Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

\texttt{BITS}w.d

Syntax Description

\textit{w} specifies the number of bits to read.

Default \texttt{1}
Range \texttt{1–64}

\textit{d} specifies the zero-based offset.

Range \texttt{0–63}

Details

The BITSw.d informat extracts particular bits from an input stream and assigns the numeric equivalent of the extracted bit string to a variable. Together, the \texttt{w} and \texttt{d} values specify the location of the string that you want to read.

This informat is useful for extracting data from system records with many pieces of information packed into single bytes.

Example

The EBCDIC binary code for a capital B is 11000010, and the ASCII binary code is 01000010. The INPUT statement reads four bits (\texttt{w=4}), which is the bit string 1000, and stores the numeric value 8, which is equivalent to this binary combination.
data _null_;  
a=input('B',bits4.1);  
put a=;  
run;

SAS writes the following to the log:

a=8

---

BZw.d Informat

Converts blanks to 0s.

Categories:  
CAS  
Numeric

Syntax

BZw.d

Syntax Description

w

specifies the width of the input field.

Default: 1
Range: 1–32

d

specifies the power of 10 by which to divide the value. If the data contains decimal points, the d value is ignored. This argument is optional.

Range: 0–31

Details

The BZw.d informat reads numeric values, converts any trailing or embedded blanks to 0s, and ignores leading blanks.

The BZw.d informat can read numeric values that are located anywhere in the field. Blanks can precede or follow the numeric value, and a minus sign must precede negative values. The BZw.d informat ignores blanks between a minus sign and a numeric value in an input field.

The BZw.d informat interprets a single period in a field as a 0. The informat interprets multiple periods or other nonnumeric characters in a field as a missing value.

To use BZw.d in a DATA step with list input, change the delimiter for list input with the DLM= or DLMSTR= option in the INFILE statement. By default, SAS interprets blanks between values in the variable as delimiters rather than 0s.
Comparisons

The BZw.d informat converts trailing or embedded blanks to 0s. If you do not want to convert trailing blanks to 0s (for example, when reading values in E notation), use either the w.d informat or the Ew.d informat instead.

Example

```sas
data _null_;  
input @1 x bz4.;  
put x;  
datalines;  
34  
-2  
-2 1  
.  
run;
```

SAS writes the following output to the log:

```
3400  
-200  
-201  
0
```

CBw.d Informat

Reads standard numeric values from column-binary files.

Categories: CAS  
Column Binary

Syntax

**CBw.d**

Syntax Description

- **w**  
  specifies the width of the input field.

  Default: 1  
  Range: 1–32

- **d**  
  0–31, specifies the power of 10 by which to divide the value. SAS uses the $d$ value even if the data contains decimal points. This argument is optional.
Details

Column-binary data storage compresses data so that more than 80 items of data can be stored on a single "virtual" punch card.

The CBw.d informat reads standard numeric values from column-binary files and translates the data into standard binary format.

SAS first stores each column of column-binary data that you read with CBw.d in 2 bytes and ignores the two high-order bits of each byte. If the punch codes are valid, SAS stores the equivalent numeric value in the variable that you specify. If the combinations are not valid, SAS assigns the variable a missing value and sets the automatic variable _ERROR_ to 1.

Example: Examples

```sas
input @1 x cb8.;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>0009</td>
<td>9</td>
</tr>
</tbody>
</table>

1 The variable is a hexadecimal representation of the column binary. The "virtual" punch card column for the example data has row 9 punched. The binary representation is 0000 0000 0000 1001.

See Also

Informats

- "$CBw. Informat" on page 513
- “PUNCH.d Informat” on page 605
- “ROWw.d Informat” on page 611

COMMAw.d Informat

Removes embedded characters.

Categories: CAS, Numeric

Alias: DOLLARw.d

Syntax

```
COMMAw.d
```
Syntax Description

\( w \)
specifies the width of the input field.

Default: 1

Range: 1–32

\( d \)
specifies the power of 10 by which to divide the value. If the data contains decimal points, the \( d \) value is ignored. This argument is optional.

Range: 0–31

Details

The COMMA\( w \).\( d \) informat reads numeric values and removes embedded commas, blanks, dollar signs, percent signs, hyphens, and close parentheses from the input data. The COMMA\( w \).\( d \) informat converts an open parenthesis at the beginning of a field to a minus sign.

Comparisons

The COMMA\( w \).\( d \) informat operates like the COMMAX\( w \).\( d \) informat, but it reverses the roles of the decimal point and the comma. This convention is common in European countries.

Example

```sas
data test;
  value='$1,000,000';
  value2=input(value,comma10.);
  put value2 ;
run;
```

SAS writes the following output to the log:

```
1000000
```

**COMMAX\( w \).\( d \) Informat**

Removes embedded periods, blanks, dollar signs, percent signs, hyphens, and close parentheses from the input data. An open parenthesis at the beginning of a field is converted to a minus sign. The COMMAX informat reverses the roles of the decimal point and the comma.

Categories: CAS, Numeric

Alias: DOLLARX\( w \).\( d \)
Syntax

COMMAX\textsubscript{\(w.d\)}

Syntax Description

\textbf{\(w\)}

specifies the width of the input field.

Default \hspace{.5cm} 1

Range \hspace{.5cm} 1–32

\textbf{\(d\)}

specifies the power of 10 by which to divide the value. If the data contains a comma, which represents a decimal point, the \(d\) value is ignored. This argument is optional.

Range \hspace{.5cm} 0–31

Details

The COMMAX\(w.d\) informat reads numeric values and removes embedded periods, blanks, dollar signs, percent signs, hyphens, and closing parentheses from the input data. The COMMAX\(w.d\) informat converts an open parenthesis at the beginning of a field to a minus sign.

Comparisons

The COMMAX\(w.d\) informat operates like the COMMA\(w.d\) informat, but it reverses the roles of the decimal point and the comma. This convention is common in European countries.

Example

```sas
data one;
  input @1 x commax10.;
  put x;
  datalines;
$1.000.000
1.234,56
(500)
run;
```

SAS writes the following output to the log:

```
1000000
1234.56
-500
```
DATEw. Informat

Reads date values in the form `ddmmmyy` or `ddmmmyyyy`.

Categories:
- CAS
- Date and Time

Syntax

```
DATEw.
```

Syntax Description

`w` specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>7–32</td>
<td>Use a width of 9 to read a four-digit year.</td>
</tr>
</tbody>
</table>

Details

The date values must be in the form `ddmmmyy` or `ddmmmyyyy`.

- `dd` is an integer between 01 and 31 that represents the day of the month.
- `mmm` are the first three letters of the month name.
- `yy` or `yyyy` is a two-digit or four-digit integer that represents the year.

You can separate the year, month, and day values by blanks or special characters. Ensure that the width of the input field allows space for blanks and special characters.

Note: SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

```
data test;
  date='28JAN2020';
  sasdate=input(date,date9.);
  put sasdate;
  put sasdate date9;
run;
```
### DATETIMEw. Informat

Reads datetime values in the form `ddmmmyy hh:mm:ss.ss` or `ddmmmyyyy hh:mm:ss.ss`.

**Categories:**
- CAS
- Date and Time

**Syntax**

`DATETIMEw.`

**Syntax Description**

**w** specifies the width of the input field.

- **Default**: 18
- **Range**: 13–40

**Details**

The datetime values must be in the following form: `ddmmmyy` or `ddmmmyyyy`, followed by a blank or special character, followed by `hh:mm:ss.ss` (the time).

**dd**

is an integer between 01 and 31 that represents the day of the month.
mmm
    are the first three letters of the month name.

yy or yyyy
    is a two-digit or four-digit integer that represents the year.

hh
    is an integer between 00 and 23 that represents hours.

mm
    is an integer between 00 and 59 that represents minutes.

ss.ss
    is the number of seconds that range from 00–59 with the fraction of a second
    following the decimal point.

DATETIMEw. requires values for both the date and the time. However, the ss.ss
    portion is optional.

---

Note: SAS interprets a two-digit year as part of the 100-year span that is defined by
    the YEARCUTOFF= system option.

---

Note: SAS can read time values with AM and PM in them.

---

Comparisons

The DATETIMEw.d informat reads datetime values with optional separators in the
    form dd-mmm-yy<yy> hh:mm:ss.ss AM | PM, and the date and time can be
    separated by a special character.

The MDYAMPmW.d informat reads datetime values with optional separators in the
    form mm-dd-yy<yy> hh:mm:ss.ss AM | PM, and requires a space between the date
    and the time.

The YMDDTtMw.d informat reads datetime values with required separators in the
    form <yy>yy-mm-dd/hh:mm:ss.ss.

Example

data test;
    date='04MAY2018:13:33:18';
    sasdate=input(date,datetime.);
    put sasdate ;
    put sasdata datetime20.;
run;

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdata ;</td>
<td>1841059998</td>
</tr>
<tr>
<td>put sasdata datetime20.;</td>
<td>04MAY2018:13:33:18</td>
</tr>
</tbody>
</table>
DDMMYYw. Informat

Reads date values in the form `ddmmyy<yy>` or `dd-mm-yy<yy>`, where a special character such as a hyphen (-), period (.), or slash (/) separates the day, month, and year. The year can be either two or four digits.

Categories: CAS
Date and Time

Syntax

```
DDMMYYw.
```

Syntax Description

`w`

specifies the width of the input field.

Default 6
Range 6–32

Details

The date values must be in the form `ddmmyy<yy>` or `ddmmxx<yy>`. 
\(dd\)

is an integer between 01 and 31 that represents the day of the month.

\(mm\)

is an integer between 01 and 12 that represents the month.

\(yy\) or \(yyyy\)

is a two-digit or four-digit integer that represents the year.

\(x\)

is a separator that can be any special character or a blank space.

If you use separators, place them between all the values. Blanks can also be placed before and after the date. Ensure that the width of the input field allows space for blanks and special characters.

**Note:** SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

**Example**

```sas
data test;
  date='04/05/2018';
  sasdate=input(date,ddmmyy10.);
  put sasdate ;
  put sasdate date9.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdate ;</td>
<td>21308</td>
</tr>
<tr>
<td>put sasdate date9.;</td>
<td>04MAY2018</td>
</tr>
</tbody>
</table>

E8601DAw. Informat

Reads date values that are specified using the ISO 8601 extended notation yyyy-mm-dd.

Categories:
- CAS
- Date and Time
- ISO 8601

Alignment:
- Left

Alias:
- IS8601DAw

Restriction:
UTC time zone offset values are not supported.

Supports:
ISO 8601 Element 5.2.1.1, complete representation

Syntax

E8601DAw.

Syntax Description

w

specifies the width of the input field.

Default 10

Requirement The width of the input field must be 10.

Details

The E8601DA informat reads date values that are specified in the ISO 8601 extended date notation yyyy-mm-dd.

yyyy
is a four-digit year.

mm
is a two-digit month (zero padded) between 01 and 12.

dd
is a two-digit day of the month (zero padded) between 01 and 31.

Example

data one;
  input eda e8601da.;
SAS writes the following output to the log:

```
21442
```

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

### E8601DNw. Informat

Reads date values that are specified using the ISO 8601 extended notation `yyyy-mm-dd` and returns SAS datetime values where the time portion of the value is 000000.

**Categories:**
- CAS
- Date and Time
- ISO 8601

**Alignment:** Left

**Alias:** IS8601DNw

**Restriction:** UTC time zone offset values are not supported.

**Supports:** ISO 8601 Element 5.2.1.1, complete representation

### Syntax

**E8601DNw.**

### Syntax Description

- **w** specifies the width of the input field.

  **Default** 10

  **Requirement** The width of the input field must be 10.

### Details

The E8601DN informat reads date values that are specified using the ISO 8601 extended date notation `yyyy-mm-dd` and returns the date in a SAS datetime value.

- **yyyy** is a four-digit year.
$mm$

is a two-digit month (zero padded) between 01 and 12.

$dd$

is a two-digit day of the month (zero padded) between 01 and 31.

Example

data one;
   input edn e8601dn.;
   put edn;
   datalines;
2018-09-15
;
run;

SAS writes the following output to the log:

1852588800

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

E8601DTw.d Informat

Reads datetime values that are specified using the ISO 8601 extended notation $yyyy-mm-ddThh:mm:ss.<ffffff>$.

Categories: CAS
Date and Time
ISO 8601

Alignment: Left

Aliases: E8601LXw.d
IS8601DTw.d

Restriction: UTC time zone offset values are not supported.

Supports: ISO 8601 Element 5.4.1, complete representation

Syntax

E8601DTw.d

Syntax Description

w
specifies the width of the input field.

Default 19
Range 16–26

d specifies the number of digits to the right of the decimal point in the seconds value. This argument is optional.

Default 0

Range 0–6

Details

The E8601DT informat reads datetime values that are specified using the ISO 8601 extended datetime notation yyyy-mm-ddThh:mm:ss.<ffffff>.

yyyy is a four-digit year.

mm is a two-digit month (zero padded) between 01 and 12.

dd is a two-digit day of the month (zero padded) between 01 and 31.

hh is a two-digit hour (zero padded) between 00 and 23.

mm is a two-digit minute (zero padded) between 00 and 59.

ss is a two-digit second (zero padded) between 00 and 59.

ffffff are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

Note: If you specify a width of 16, SAS assumes that the value for seconds is 0 and omits them from the output.

Example

```sas
data one;
  input edt e8601dt.;
  put edt;
datalines;
2018-09-15T15:53:00
;
run;
```

SAS writes the following output to the log:

```
1852645980
```

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

---

**E8601DXw. Informat**

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, reads the local date and time by using the ISO 8601 datetime and time zone extended notation `yyyy-mm-ddThh:mm:ss±|–hh:mm`.

See: The E8601DXw. informat uses the E8601DZw.d informat to read data. See “E8601DZw.d Informat” on page 568.

**Syntax**

`E8601DXw.`

---

**E8601DZw.d Informat**

Reads Coordinated Universal Time (UTC) datetime values that are specified using the ISO 8601 datetime extended notation `yyyy-mm-ddThh:mm:ss±|–hh:mm.<fff>` or `yyyy-mm-ddThh:mm:ss.<fff><Z>`.

**Categories:** CAS, Date and Time, ISO 8601

**Alignment:** Left

**Aliases:** E8601DXw.d, IS8601DZw.d

**Supports:** ISO 8601 Element 5.4.1, complete representation

**Syntax**

`E8601DZw.d`

**Syntax Description**

`w`

specifies the width of the input field.

Default: 26

Range: 20–35

`d`

specifies the number of digits to the right of the decimal point in the value for the lowest-order component. This argument is optional.
Details
UTC values specify a time and a time zone based on the zero meridian in Greenwich, England. The E8601DZ informat reads datetime values that contain UTC time offsets and that are specified in one of these ISO 8601 extended datetime notations:

- `yyyy-mm-ddThh:mm:ss<ffffff>+|–hh:mm`
- `yyyy-mm-ddThh:mm:ss<ffffff>Z`

`yyyy`
- is a four-digit year.

`mm`
- is a two-digit month (zero padded) between 01 and 12.

`dd`
- is a two-digit day of the month (zero padded) between 01 and 31.

`hh`
- is a two-digit hour (zero padded) between 00 and 24.

`mm`
- is a two-digit minute (zero padded) between 00 and 59.

`ss`
- is a two-digit second (zero padded) between 00 and 59.

`ffffff`
- are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

`+|–hh:mm`
- is an hour and minute signed offset from zero meridian time. Note that the offset must be `+|–hh:mm` (that is, + or – and five characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and –06:00 indicates a six-hour time difference to the west of the zero meridian.

**Restriction**: The shorter form `+|–hh` is not supported.

`Z`
- indicates that the time is UTC time at the zero meridian (Greenwich, England).

Example
```plaintext
data one;
  input edz e8601dz.;
  put edz= edz=datatime22
data lines;
  2018-09-15T15:53:00Z
  ;
run;
```
data one;
  input edz e8601dz28.2;
  put edz= edz=datetime22
datalines;
  2018-09-15T15:53:00+03:00
;
run;

SAS writes the following output to the log:

<table>
<thead>
<tr>
<th>edz=1852645980</th>
<th>edz=1852645980</th>
</tr>
</thead>
<tbody>
<tr>
<td>edz=1852635180</td>
<td>edz=1852635180</td>
</tr>
</tbody>
</table>

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

E8601LXw. Informat

Reads datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 extended notation yyyy-mm-ddThh:mm:ss±|–hh:mm.

Restriction: This informat is not supported in a DATA step that runs in CAS.

See: The E8601LXw. informat uses the E8601DTw.d informat to read data. See "E8601DTw.d Informat" on page 566.

Syntax

E8601LXw.

E8601LZw.d Informat

Reads Coordinated Universal Time (UTC) values that are specified using the ISO 8601 extended notation hh:mm:ss±|–hh:mm.<fffff> or hh:mm:ss.<fffff>Z and converts the values to the local time.

Categories: Date and Time
ISO 8601

Alignment: Left

Alias: IS8601LZw.d

Restriction: This informat is not supported in a DATA step that runs in CAS.

Supports: ISO 8601 Element 5.3.1.1, complete representation

Syntax

E8601LZw.d
Syntax Description

**w**
specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>14</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>9–20</td>
</tr>
</tbody>
</table>

**Requirement**
To read a time with the Z time zone indicator, the width of the input field must be 9 if more data follows the time on the same line of data.

**d**
specifies the number of digits to the right of the decimal point in the value for the lowest-order component. This argument is optional.

<table>
<thead>
<tr>
<th>Default</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>0–6</td>
</tr>
</tbody>
</table>

Details

UTC values specify a time and a time zone based on the zero meridian in Greenwich, England. The E8601LZ informat reads UTC time values that are specified in one of these ISO 8601 extended time notations and returns a SAS time value for the local time:

- **hh:mm:ss.ffffff+|–hh:mm**
- **hh:mm:ss.ffffffZ**

**hh**
is a two-digit hour (zero padded) between 00 and 23.

**mm**
is a two-digit minute (zero padded) between 00 and 59.

**ss**
is a two-digit second (zero padded) between 00 and 59.

**ffffff**
are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

**+|–hh:mm**
is an hour and minute signed offset from zero meridian. Note that the offset must be +|–hh:mm (that is, + or – and five characters).

Use the + for time zones east of the zero meridian, and use the – for time zones west of the zero meridian.

**Restriction:** The shorter form +|–hh is not supported.

**Z**
indicates zero meridian or +00:00 UTC time.

When SAS reads a UTC time by using the E8601LZ informat and the adjusted time is greater than 24:00:00 or less than 00:00:00, SAS adjusts the value so that the time is between 00:00:00 and 24:00:00. For example, if SAS reads the UTC time 23:43:44-05:00 by using the E8601LZ informat, SAS adds five hours to the time so
that the value is 28:43:44, and then makes the time adjustment. The value stored represents the time 04:43:44+00:00.

Example

data one;
  input edz e8601lz.;
  put etz= etz=time8.;
  datalines;
09:13:21+02:00
23:43:44Z
;
run;

SAS writes the following output to the log:

<table>
<thead>
<tr>
<th>edz</th>
<th>etz</th>
</tr>
</thead>
<tbody>
<tr>
<td>8001</td>
<td>2:13:21</td>
</tr>
<tr>
<td>85424</td>
<td>23:43:44</td>
</tr>
</tbody>
</table>

See Also

“Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations” on page 487

---

**E8601TMw.d Informat**

Reads time values that are specified using the ISO 8601 extended notation `hh:mm:ss.<fffffff>`.

**Categories:**
- CAS
- Date and Time
- ISO 8601

**Alignment:** Left

**Alias:** IS8601TM.w.d

**Restriction:** UTC time zone offset values are not supported.

**Supports:** ISO 8601 Elements 5.3.1.1 and 5.3.1.3, complete representation and representation of decimal fractions

**Syntax**

`E8601TMw.d`

**Syntax Description**

`w`

specifies the width of the input field.

- **Default:** 8
- **Range:** 8–15
The E8601TM informat reads time values that are specified using the ISO 8601 extended time notation `hh:mm:ss.<ffffff>`.

- **hh**
  - is a two-digit hour (zero padded) between 00 and 23.

- **mm**
  - is a two-digit minute (zero padded) between 00 and 59.

- **ss**
  - is a two-digit second (zero padded) between 00 and 59.

- **ffffff**
  - are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

**Example**

```sas
data one;
  input edm e8601tm.;
  put edm;
  datalines;
15:53:00
; run;
```

SAS writes the following output to the log:

```
57180
```

**See Also**

"Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 487

---

### E8601TXw. Informat

Adjusts a Coordinated Universal Time (UTC) value to the user's local time. Then, reads the local time by using the ISO 8601 extended time notation `hh:mm:ss+|–hh:mm`.

**Restriction:**

This informat is not supported in a DATA step that runs in CAS.

**See:**

The E8601TXw. informat uses the E8601TZw.d informat to read data. See "E8601DZw.d Informat" on page 568.
Syntax

E8601TXw.

E8601TZw.d Informat

Reads time values that are specified using the ISO 8601 extended time notation \( hh:mm:ss+\text{-}hh:mm.<fffff> \) or \( hh:mm:ssZ \).

Categories: CAS
Date and Time
ISO 8601

Alignment: Left

Aliases: E8601TXw.d
IS8601TZw.d

Supports: ISO 8601 Element 5.3.1.1, complete representation

Syntax

E8601TZw.d

Syntax Description

\( w \)

specifies the width of the input field.

Default 14
Range 9–20

Requirement To read a time with the Z time zone indicator, the width of the input field must be 9 if more data follows the time on the same line of data.

\( d \)

specifies the number of digits to the right of the decimal point in the value for the lowest-order component. This argument is optional.

Default 0
Range 0–6

Details

UTC time values specify a time and a time zone based on the zero meridian in Greenwich, England. The E8601TZ informat reads UTC time values that are specified in one of these ISO 8601 extended notations:

- \( hh:mm:ss+\text{-}hh:mm.<fffff> \)
- \( hh:mm:ssZ \)
**hh**

is a two-digit hour (zero padded) between 00 and 23.

**mm**

is a two-digit minute (zero padded) between 00 and 59.

**ss**

is a two-digit second (zero padded) between 00 and 59.

**ffffff**

are optional fractional seconds, with a precision of up to six digits, where each digit is between 0 and 9.

**+|–hh:mm**

is an hour and minute signed offset from zero meridian. Note that the offset must be **+|–hh:mm** (that is, + or – and five characters).

Use the + for time zones east of the zero meridian, and use the – for time zones west of the zero meridian.

**Restriction:** The shorter form **+|–hh** is not supported.

**Z**

indicates zero meridian or +00:00 UTC time.

When SAS reads a UTC time by using the E8601TZ informat and the adjusted time is greater than 24:00:00 or less than 00:00:00, SAS adjusts the value so that the time is between 00:00:00 and 24:00:00. For example, if SAS reads the UTC time 23:43:44–05:00 by using the E8601TZ informat, SAS adds five hours to the time so that the value is 28:43:44, and then makes the time adjustment. The value stored represents the time 04:43:44+00:00.

**Example**

```sas
data one;
  input etz e8601tz.;
  put etz= etz=time8.;
datalines;
23:43:44-05:00
23:43:44Z
;
run;
```

SAS writes the following output to the log:

```
etz=17024   etz=4:43:44
etz=85424   etz=23:43:44
```

**See Also**

"Reading Dates and Times by Using the ISO 8601 Basic and Extended Notations" on page 487

---

**FLOATw.d Informat**

Reads a native single-precision, floating-point value and divides it by 10 raised to the $d$th power.

**Categories:** CAS
Interaction:

List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

FLOAT\textsuperscript{w.d}

Syntax Description

\textbf{w}\quad specifies the width of the input field.

\textbf{Requirement}\quad \textit{w} must be 4.

\textbf{d}\quad specifies the power of 10 by which to divide the value. This argument is optional.

Details

The FLOAT\textit{w.d} informat is useful in operating environments where a float value is not the same as a truncated double.

On the IBM mainframe systems, a 4-byte floating-point number is the same as a truncated 8-byte floating-point number. However, in operating environments that use the IEEE floating-point standard, such as the IBM PC-based operating environments and most UNIX platforms, a 4-byte floating-point number is not the same as a truncated double. Therefore, the RB4. informat does not produce the same results as FLOAT4. Floating-point representations other than IEEE might have this same characteristic. Values read with FLOAT4. typically come from some other external program that is running in your operating environment.

Comparisons

The following table compares the names of float notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Float Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>FLOAT4.</td>
</tr>
<tr>
<td>Fortran</td>
<td>REAL*4</td>
</tr>
<tr>
<td>C</td>
<td>float</td>
</tr>
<tr>
<td>IBM 370 ASM</td>
<td>E</td>
</tr>
<tr>
<td>PL/I</td>
<td>FLOAT BIN(21)</td>
</tr>
</tbody>
</table>
Example

```plaintext
input x float4.;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------1---------2</td>
<td></td>
</tr>
<tr>
<td>3F800000</td>
<td>1</td>
</tr>
</tbody>
</table>

1 The variable is a hexadecimal representation of a binary number that is stored in IEEE form.

**HEXw. Informat**

Converts hexadecimal positive binary values to either integer (fixed-point) or real (floating-point) binary values.

 Categories: CAS
Numeric

See:
- “HEX Informat: UNIX” in SAS Companion for UNIX Environments
- “HEXw. Informat: Windows” in SAS Companion for Windows
- “HEXw. Informat: z/OS” in SAS Companion for z/OS

**Syntax**

```plaintext
HEXw.
```

**Syntax Description**

w specifies the field width of the input value and also specifies whether the final value is fixed-point or floating-point.

**Default** 8

**Range** 1–16

**Tip** If w<16, HEXw. converts the input value to positive integer binary values, treating all input values as positive (unsigned). If w is 16, HEXw. converts the input value to real binary (floating-point) values, including negative values.

**Details**

Operating Environment Information: Different operating environments store floating-point values in different ways. However, HEX16. reads hexadecimal representations of floating-point values with consistent results if the values are expressed in the same way that your operating environment stores them.

The HEXw. informat ignores leading or trailing blanks.
Example

data _null_;   
a=input('88F'x,hex3.); 
b=input('4152000000000000'x,hex16.);   
put a= b=; run;  

SAS writes the following to the log:

| a=2191 b=4718592 |

HHMMSSw. Informat

Reads hours, minutes, and seconds in the form hh:mm:ss or hhmmss.

Syntax

HHMMSSw.

Syntax Description

w
specifies the width of the input field.

Default 8
Range 1–20

Details

The HHMMSSw. informat reads SAS time values in one of these forms:

- hh:mm:ss
- hhmmss

hh
is an integer that represents the number of hours.

:mm
represents a special character that separates hours, minutes, and seconds.

mm
is an integer that represents the number of minutes.

ss
is an integer that represents the number of seconds. Fractional seconds are ignored.

If the input data is six digits, SAS reads the data from left to right as hours, minutes, and seconds. For data that is less than six digits, SAS follows these rules:
If the number has an odd number of digits, SAS pads a zero to the left of the first digit. Then, SAS pads after the last digit to the right with zeros until there are six digits.

If the number has an even number of digits, SAS pads zeros to the right of the last digit until there are six digits.

The first two digits are read as hours. Digits three and four are read as minutes. Digits five and six are read as seconds.

- 1 is the same as 010000 or 1:00:00.
- 02 is the same as 020000 or 2:00:00.
- 124 is the same as 0124000 or 1:24:00.
- 1435 is the same as 143500 or 14:35:00.
- 20345 is the same as 020345 or 2:03:45.
- 165532 is the same as 16:55:32.

When there are more than six digits, SAS reads the last two digits from the right as seconds. SAS reads the third and forth digits from the right as minutes. SAS reads the remaining digits to the left of the minutes as hours.

- 2358444 is the same as 235:84:44.
- 1254533 is the same as 1254:55:33.

If the input data has only one colon (for example, 17:35), SAS reads the two digits before the colon as hours. SAS reads the two digits after the colon as seconds. The number of seconds is 0.

If a colon is omitted between minutes and seconds, as in 12:3400, SAS reads the 3400 as 3400 minutes. 3400 minutes adds 56 hours and 40 minutes to the 12 hours, resulting in 68:40:00.

**Example**

```sas
data test;
  time='12:45:44';
  sastime=input(time,hhmmss.);
  put sastime;
  put sastime time8.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sastime ;</td>
<td>45944</td>
</tr>
<tr>
<td>put sastime time8.;</td>
<td>12:45:44</td>
</tr>
</tbody>
</table>

**See Also**

**Informats:**
- "TIMEw. Informat" on page 634
IBw.d Informat

Reads native integer binary (fixed-point) values, including negative values.

Categories: CAS
Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

See: “IB Informat: UNIX” in SAS Companion for UNIX Environments
“IBw.d Informat: Windows” in SAS Companion for Windows
“IBw.d Informat: z/OS” in SAS Companion for z/OS

Syntax

\texttt{IBw.d}

Syntax Description

\textbf{w}

specifies the width of the input field.

Default 4
Range \texttt{1–8}

\textbf{d}

specifies the power of 10 by which to divide the value. This argument is optional.

Range \texttt{0–10}

Details

The \texttt{IBw.d} informat reads integer binary (fixed-point) values, including negative values represented in two's complement notation. \texttt{IBw.d} reads integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

\textbf{Note:} Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 480.

Comparisons

The \texttt{IBw.d} and \texttt{PIBw.d} informats are used to read native format integers. (Native format enables you to read and write values created in the same operating
The IBR\textsubscript{w.d} and PIBR\textsubscript{w.d} informats are used to read little endian integers in any operating environment.

To view a table that shows the type of informat to use with big endian and little endian integers, see "Reading Data Generated on Big Endian and Little Endian Platforms" on page 480.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

### Example

You can use the INPUT statement and specify the IB informat. However, these examples use the informat with the INPUT function, where binary input values are described using a hexadecimal literal.

```sas
data one;
  result=input('0080'x,ib4.);
  put result;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result on Big Endian Platforms</th>
<th>Result on Little Endian Platforms</th>

</thead>
<tbody>
<tr>
<td>put result;</td>
<td>128</td>
<td>-32768</td>
</tr>
</tbody>
</table>

### See Also

- **Informats:**
  - "IBR\textsubscript{w.d} Informat" on page 581

#### IBR\textsubscript{w.d} Informat

Reads integer binary (fixed-point) values in Intel and DEC formats.

**Categories:** CAS, Numeric

**Interaction:** List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

`IBR\textsubscript{w.d}`
Syntax Description

\( w \)

specifies the width of the input field.

Default \( 4 \)

Range \( 1-8 \)

\( d \)

specifies the power of 10 by which to divide the value. This argument is optional.

Range \( 0-10 \)

Details

The IBR\( w.d \) informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. IBR\( w.d \) reads integer binary values that are generated by and for Intel and DEC platforms. Use IBR\( w.d \) to read integer binary data from Intel or DEC environments in other operating environments. The IBR\( w.d \) informat in SAS code allows for a portable implementation for reading the data in any operating environment.

Note: Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms" on page 480.

Comparisons

The IB\( w.d \) and PIB\( w.d \) informats are used to read native format integers. (Native format enables you to read and write values that are created in the same operating environment.) The IBR\( w.d \) and PIBR\( w.d \) informats are used to read little endian integers in any operating environment.

In Intel and DEC operating environments, the IB\( w.d \) and IBR\( w.d \) informats are equivalent.

To view a table that shows the type of informat to use with big endian and little endian integers, see "Reading Data Generated on Big Endian and Little Endian Platforms" on page 480.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

Example

You can use the INPUT statement and specify the IBR informat. However, in these examples, we use the informat with the INPUT function, where binary input values are described using a hexadecimal literal.

data one;
  x=input('0100'x,ibr2.);
  y=input('0001'x,ibr2.);
  result=input('80000000'x,ibr4.);
put x;
put y;
put result;
run;

<table>

**IEEEw.d Informat**

Reads an IEEE floating-point value and divides it by 10 raised to the $d$th power.

Categories: CAS
            Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

**IEEE$w$.d**

**Syntax Description**

$w$

specifies the width of the input field.

Default 4

Range 3–8

Tip If $w$ is 8, an IEEE double-precision, floating-point number is read. If $w$ is 5, 6, or 7, an IEEE double-precision, floating-point number is read, which assumes truncation of the appropriate number of bytes. If $w$ is 4, an IEEE single-precision, floating-point number is read. If $w$ is 3, an IEEE single-precision, floating-point number is read, which assumes truncation of 1 byte.
\[ d \]

specifies the power of 10 by which to divide the value.

**Details**

The IEEE\(d\) informat is useful in operating environments where IEEE is the floating-point representation that is used. In addition, you can use the IEEE\(w.d\) informat to read files that are created by programs in operating environments that use the IEEE floating-point representation.

Typically, programs generate IEEE values in single precision (4 bytes) or double precision (8 bytes). Truncation is performed by programs solely to save space on output files. Machine instructions require that the floating-point number be one of the two lengths. The IEEE\(w.d\) informat allows other lengths, which enables you to read data from files that contain space-saving truncated data.

**Example**

The variables are hexadecimal representations of binary numbers that are stored in IEEE format.

```
data _null_;  
a=input('3F800000'x,ieee4.);  
b=input('3FF0000000'x,ieee5.);  
put a= b=;  
run;  
```

SAS writes the following to the log:

```
a=1 b=1
```

---

**JULIAN\(w\). Informat**

Reads Julian dates in the form \(yyddd\) or \(yyyyddd\).

**Categories:**

- CAS
- Date and Time

**See:**

“Julian Date Formats and Astronomical Dates” on page 10

**Syntax**

**JULIAN\(w\).**

**Syntax Description**

\[ w \]

specifies the width of the input field.

**Default** 5

**Range** 5–32
Details

The date values must be in one of these forms:

- yyddd
- yyyyddd

**yy** or **yyyy**

is a two-digit or four-digit integer that represents the year.

**dd** or **ddd**

is an integer from 01–365 that represents the day of the year.

**Julian dates consist of strings of contiguous numbers, which means that zeros must pad any space between the year and the day values.**

**Julian dates that contain year values before 1582 are invalid for the conversion to Gregorian dates.**

---

**Note:** SAS interprets a two-digit year as part of the 100-year span that is defined by the **YEARCUTOFF=** system option.

---

**Example**

```sas
data test;
  date='2018099';
  sasdate=input(date,julian7.);
  put sasdate ;
  put sasdate date9.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdate ;</td>
<td>21283</td>
</tr>
<tr>
<td>put sasdate date9.</td>
<td>09APR2018</td>
</tr>
</tbody>
</table>

---

MDYAMPMw.d Informat

Reads datetime values in the form `mm-dd-yy<yy> hh:mm:ss.ss AM|PM`, where a special character such as a hyphen (-), period (.), slash (/), or colon (:), or period (.) separates the month, day, and year. The year can be either two or four digits.

Categories: CAS
Date and Time

Alignment: Right

Requirement: A space must separate the date and the time.

Note: The default time period is AM.

Syntax

**MDYAMPMw.d**

Syntax Description

\( w \)

specifies the width of the output field.

Default: 19
Range: 8–40

\( d \)

specifies the number of digits to the right of the decimal point in the seconds value. The digits to the right of the decimal point specify a fraction of a second. This argument is optional.

Default: 0
Range: 0–39

Details

The MDYAMPMw.d format reads SAS datetime values in the form `mm-dd-yy<yy> hh:mm:ss.ss <AM | PM>`.

\( mm \)

is an integer between 01 and 12 that represents the month.

\( dd \)

is an integer between 01 and 31 that represents the day of the month.

\( yy \) or \( yyyy \)

specifies a two-digit or four-digit integer that represents the year.

\( hh \)

is an integer between 00 and 23 that represents hours.
\textit{mm} is an integer between 00 and 59 that represents minutes.

\textit{ss.ss} is the number of seconds that range from 00–59 with the fraction of a second following the decimal point.

\textbf{Requirement}: If a fraction of a second is specified, the decimal point can be represented only by a period and is required.

\textbf{AM | PM} specifies either the time period 00:01–12:00 noon (AM) or the time period 12:01–12:00 midnight (PM).

- or :
  represents one of several special characters such as the slash (/), hyphen (-), colon (:), or a blank character that can be used to separate date and time components. Special characters can be used as separators between any date or time component and between the date and the time.

\textbf{Comparisons}

The \texttt{MDYAMP\textit{w.d} Informat} reads datetime values with optional separators in the form \texttt{mm-dd-yy<yy> hh:mm:ss.ss AM | PM}, and requires a space between the date and the time.

The \texttt{DATETIME\textit{w.d} Informat} reads datetime values with optional separators in the form
\texttt{dd-mmm-yy<yy> hh:mm:ss.ss AM|PM}, and the date and time can be separated by a special character.

The \texttt{YMDDTTM\textit{w.d} Informat} reads datetime values with required separators in the form \texttt{<yy>yy-mm-dd/hh:mm:ss.ss}.

\textbf{Example}

```sas
data test;
  date='04-30-18 3:27 pm';
  sasdate=input(date,mdyampm.);
  put sasdate ;
  put sasdate datetime20.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdate ;</td>
<td>1840721220</td>
</tr>
<tr>
<td>put sasdate datetime20.;</td>
<td>30APR2018:15:27:00</td>
</tr>
</tbody>
</table>

\textbf{See Also}

\textbf{Informats}:

MMDDYYW. Informat

Reads date values in the form mmddyy or mmddyyyy.

Categories:
- CAS
- Date and Time

Syntax

MMDDYYW.

Syntax Description

W
  specifies the width of the input field.

  Default: 6
  Range: 6–32

Details

The date values must be in one of these forms:

- mmddyy
- mmddyyyy

**mm**
  is an integer between 01 and 12 that represents the month.

**dd**
  is an integer between 01 and 31 that represents the day of the month.

**yy** or **yyyy**
  is a two-digit or four-digit integer that represents the year.

You can separate the month, day, and year fields by blanks or special characters. However, if you use delimiters, place them between all fields in the value. Blanks can also be placed before and after the date.

**Note:** SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

```sas
data test;
  date='05/04/2018';
  sasdate=input(date,mmdy10.);
  put sasdate ;
  put sasdate date9.;
run;
```
MONYYw. Informat

Reads month and year date values in the form mmyy or mmmyyyy.

Categories: CAS
            Date and Time

Syntax

MONYYw.
Syntax Description

\( \text{w} \)

specifies the width of the input field.

**Default**: 5

**Range**: 5–32

Details

The date values must be in one of these forms:

- \( \text{mmmyy} \)
- \( \text{mmmyyyy} \)

\( \text{mmm} \)

are the first three letters of the month name.

\( \text{yy} \) or \( \text{yyyy} \)

is a two-digit or four-digit integer that represents the year.

A value read with the MONYYw. informat results in a SAS date value that corresponds to the first day of the specified month.

**Note**: SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

```sas
data test;
  date='MAY2018';
  sasdate=input(date,monyy7.);
  put sasdate ;
  put sasdate date9.;
run;
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put sasdate ;</td>
<td>21305</td>
</tr>
<tr>
<td>put sasdate date9.</td>
<td>01MAY2018</td>
</tr>
</tbody>
</table>

MSECw. Informat

Reads TIME MIC values.

Syntax

MSECw.

Syntax Description

w

specifies the width of the input field.

Requirement

w must be 8 because the OS TIME macro or the STCK System/370 instruction on IBM mainframes each returns an 8-byte value.

Details

The MSECw. informat reads time values that are produced by IBM mainframe operating environments and converts the time values to SAS time values. Use the MSECw. informat to find the difference between two IBM mainframe TIME values, with precision to the nearest microsecond.

Comparisons

The MSECw. and TODSTAMPw. informats both read IBM time-of-day clock values, but the MSECw. informat assigns a time value to a variable, and the TODSTAMPw. informat assigns a datetime value.
Example

The input time used in this example is the hexadecimal timestamp '0000EA044E65A000' that corresponds to 5:26:58 p.m.

```sas
data _null_;
  x=input('0000EA044E65A000'x,msec8.);
  put x=timeampm.;
run;
```

SAS writes the following to the log:

```
x=5:26:58 PM
```

See Also

**Informats:**
- "TODSTAMPw. Informat" on page 636

---

**NUMXw.d Informat**

Reads numeric values with a comma in place of the decimal point.

**Categories:**
- CAS
- Numeric

**Syntax**

```sas
NUMX w.d
```

**Syntax Description**

- **w**
  - specifies the width of the input field.
  - Default: 12
  - Range: 1–32

- **d**
  - specifies the number of digits to the right of the decimal. If the data contains decimal points, the d value is ignored. This argument is optional.
  - Range: 0–31

**Details**

The NUMXw.d informat reads numeric values and interprets a comma as a decimal point.
Comparisons

The NUMXw.d informat is similar to the w.d informat, except that it reads numeric values that contain a comma in place of the decimal point.

Example

data one;
   input @1 x numx10.;
   put x;
   datalines;
896,48
3064,1
6489
;
run;

SAS writes the following output to the log:

896.48
3064.1
6489

See Also

Formats:
- "NUMXw.d Format" on page 378
- "w.d Format" on page 429

OCTALw.d Informat

Converts positive octal values to integers.

Category: Numeric

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

**OCTAL**

Syntax Description

w
specifies the width of the input field.

Default 3

Range 1–24
specifies the power of 10 by which to divide the value. This argument is optional.

<table>
<thead>
<tr>
<th>Range</th>
<th>1–31</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restriction</td>
<td>must be greater than or equal to the w value.</td>
</tr>
</tbody>
</table>

**Details**

Use only the digits 0 through 7 in the input, with no embedded blanks. The OCTAL\(w.d\) informat ignores leading and trailing blanks.

OCTAL\(w.d\) cannot read negative values. It treats all input values as positive (unsigned).

**Example**

```sas
data one;
  input @1 x octal13.1;
  put x;
  datalines;
  177;
run;
```

SAS writes the following output to the log:

```
12.7
```

**PDw.d Informat**

Reads data that is stored in IBM packed decimal format.

**Categories:** CAS, Numeric

**Interaction:** List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**See:**

- “PD Informat: UNIX” in SAS Companion for UNIX Environments
- “PDw.d Informat: Windows” in SAS Companion for Windows
- “PDw.d Informat: z/OS” in SAS Companion for z/OS

**Syntax**

\[ PDw.d \]

**Syntax Description**

\(w\)

specifies the width of the input field.
Default \( 1 \)

Range \( 1-16 \)

d

specifies the power of 10 by which to divide the value. This argument is optional.

Range \( 0-10 \)

**Details**

The PD\( w.d \) informat is useful because many programs write data in packed decimal format for storage efficiency, fitting two digits into each byte and using only a half byte for a sign.

**Note:** Different operating environments store packed decimal values in different ways. However, PD\( w.d \) reads packed decimal values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

The PD\( w.d \) format writes missing numerical data as \(-0\). When the PD\( w.d \) informat reads \(-0\), it stores it as 0.

**Comparisons**

The following table compares packed decimal notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>PD( 4 ).</td>
</tr>
<tr>
<td>COBOL</td>
<td>COMP-3 PIC S9(7)</td>
</tr>
<tr>
<td>IBM 370 Assembler</td>
<td>PL( 4 )</td>
</tr>
<tr>
<td>PL/I</td>
<td>FIXED DEC</td>
</tr>
</tbody>
</table>

**Example: Reading Packed Decimal Data**

```sas
data _null_;  
a=input('000123'x, pd3.);  
put a=;  
run;
```

SAS writes the following output to the log:

```
a=123
```
PDJULGw. Informat

Reads packed Julian date values in the hexadecimal form yyyydddF for IBM.

Category: Date and Time

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

PDJULGw.

Syntax Description

w specifies the width of the input field.

Default 4
Range 3–16

Details

The PDJULGw. informat reads IBM packed Julian date values in the form yyyydddF:

yyyy is the 2-byte representation of the four-digit Gregorian year.

ddd is the 1 1/2-byte representation of the three-digit integer that corresponds to the Julian day of the year, 1–365 (or 1–366 for leap years).

F is the half byte that contains all binary 1s, which assigns the value as positive.

Note: SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

data a;
x=input('''2018003''F',pdjulg4.);
format x mmddyy10.;
put x=;
run;

SAS writes the following output to the log:

01/03/2018

PDJULIw. Informat
Reads packed Julian dates in the hexadecimal format ccyydddF for IBM.

Category: Date and Time
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax
PDJULIw.

Syntax Description

w
specifies the width of the input field.

Default 4
Range 3–16

Details
The PDJULIw. informat reads IBM packed Julian date values in the form ccyydddF:

cc
is the 1-byte representation of a two-digit integer that represents the century.
**yy**
is the 1-byte representation of a two-digit integer that represents the year. The PDJULIw informat makes an adjustment to the 1-byte century representation by adding 1900 to the 2-byte ccyy value in order to produce the correct four-digit Gregorian year. This adjustment causes ccyy values of 0098 to become 1998, 0101 to become 2001, and 0218 to become 2118.

**ddd**
is the 1 1/2-byte representation of the three-digit integer that corresponds to the Julian day of the year, 1–365 (or 1–366 for leap years).

**F**
is the half byte that contains all binary 1s, which assigns the value as positive.

**Example**

```sas
data a;
x=input('0118019F'x,pdjuli4.);
format x mmddyy10.;
put x;
run;
```

SAS writes the following output to the log:

```
01/19/2018
```

**System Options:**
- “YEARCUTOFF= System Option” in SAS System Options: Reference
PDTIMEw. Informat

Reads packed decimal time of SMF and RMF records.

Categories:
- CAS
- Date and Time

Syntax

PDTIMEw.

Syntax Description

w
  specifies the width of the input field.

Requirement  
w must be 4 because packed decimal time values in SMF and RMF records contain 4 bytes of information.

Details

The PDTIMEw. informat reads packed decimal time values that are contained in SMF and RMF records that are produced by IBM mainframe systems and converts the values to SAS time values.

The general form of a packed decimal time value in hexadecimal notation is 0hhmmssF.

0
  is a half-byte that contains all 0s.

hh
  is 1 byte that represents two digits that correspond to hours.

mm
  is 1 byte that represents two digits that correspond to minutes.

ss
  is 1 byte that represents two digits that correspond to seconds.

F
  is a half-byte that contains all 1s.

If a field contains all 0s, PDTIMEw. treats it as a missing value.

PDTIMEw. enables you to read packed decimal time values from files that are created on an IBM mainframe in any operating environment.

Example

The variable is a hexadecimal representation of a binary time value that is stored in packed decimal form. Each byte occupies one column of the input field. The result is a SAS time value that corresponds to 2:22.25 p.m.

    data _null_;
a=input('0142225F'x,pdtime.);
  put a=;
run;

SAS writes the following to the log:

a=51745

PERCENTw.d Informat

Reads percentages as numeric values.

Categories:
  CAS
  Numeric

Syntax

PERCENTw.d

Syntax Description

w
  specifies the width of the input field.
  Default 6
  Range 1–32

d
  specifies the power of 10 by which to divide the value. If the data contains
decimal points, the d value is ignored. This argument is optional.
  Range 0–31

Details

The PERCENTw.d informat converts the numeric portion of the input data to a
number using the same method as the COMMAw.d informat. If a percent sign (%)
follows the number in the input field, PERCENTw.d divides the number by 100.

Example

data test;
  value='23.48%';
  percent=input(value,percent7.2);
  put percent;
run;

SAS writes the following output to the log:

0.2348
PIBw.d Informat

Reads positive integer binary (fixed-point) values.

Categories:
- CAS
- Numeric

Interaction:
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

See:
- “PIB Informat: UNIX” in SAS Companion for UNIX Environments
- “PIBw.d Informat: Windows” in SAS Companion for Windows

Syntax

**PIBw.d**

Syntax Description

**w**

specifies the width of the input field.

- Default: 1
- Range: 1–8

**d**

specifies the power of 10 by which to divide the value. This argument is optional.

- Range: 0–10

Details

All values are treated as positive. PIBw.d reads positive integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

---

**Note:** Different operating environments store positive integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms" on page 480.

---

Comparisons

- Positive integer binary values are the same as integer binary values, except that the sign bit is part of the value, which is always a positive integer. The PIBw.d informat treats all values as positive and includes the sign bit as part of the value.
The PIBw.d informat with a width of 1 results in a value that corresponds to the binary equivalent of the contents of a byte. The binary equivalent of the contents of a byte is useful if your data contains values between hexadecimal 80 and hexadecimal FF, where the high-order bit can be misinterpreted as a negative sign.

The IBw.d and PIBw.d informats are used to read native format integers. (Native format enables you to read and write values that are created in the same operating environment.) The IBRw.d and PIBRw.d informats are used to read little endian integers in any operating environment.

To view a table that shows the type of informat to use with big endian and little endian integers, see “Reading Data Generated on Big Endian and Little Endian Platforms” on page 480.

To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example
You can use the INPUT statement and specify the PIB informat. However, in these examples, we use the informat with the INPUT function, where binary input values are described by using a hexadecimal literal.

```sas
data _null_;  
  result=input('A',pib1.);  
  put result;  
run;  
data _null_;  
  x=input('0100'x,pib2.);  
  y=input('0001'x,pib2.);  
  put x;  
  put y;  
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result on Big Endian Platforms</th>
<th>Result on Little Endian Platforms</th>
</tr>
</thead>
<tbody>
<tr>
<td>put result;</td>
<td>193</td>
<td>65</td>
</tr>
<tr>
<td>put x;</td>
<td>256</td>
<td>1</td>
</tr>
<tr>
<td>put y;</td>
<td>1</td>
<td>256</td>
</tr>
</tbody>
</table>

- “PIBRw.d Informat” on page 603
PIBRw.d Informat

Reads positive integer binary (fixed-point) values in Intel and DEC formats.

Categories: CAS
Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

```plaintext
PIBRw.d
```

Syntax Description

- `w` specifies the width of the input field.
  - Default: 1
  - Range: 1–8

- `d` specifies the power of 10 by which to divide the value. This argument is optional.
  - Range: 0–10

Details

All values are treated as positive. PIBRw.d reads positive integer binary values that have been generated by and for Intel and DEC operating environments. Use PIBRw.d to read positive integer binary data from Intel and DEC environments in other operating environments. The PIBRw.d informat in SAS code allows for a portable implementation for reading the data in any operating environment.

**Note:** Different operating environments store positive integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 480.

Comparisons

- Positive integer binary values are the same as integer binary values, except that the sign bit is part of the value, which is always a positive integer. The PIBRw.d informat treats all values as positive and includes the sign bit as part of the value.

- The PIBRw.d informat with a width of 1 results in a value that corresponds to the binary equivalent of the contents of a byte. This is useful if your data contains
values between hexadecimal 80 and hexadecimal FF, where the high-order bit can be misinterpreted as a negative sign.

- On Intel and DEC platforms, the PIBw.d and PIBRw.d informats are equivalent.
- The IBw.d and PIBw.d informats are used to read native format integers. (Native format enables you to read and write values that are created in the same operating environment.) The IBRw.d and PIBRw.d informats are used to read little endian integers in any operating environment.

To view a table that shows the type of informat to use with big endian and little endian integers, see "Reading Data Generated on Big Endian and Little Endian Platforms" on page 480.

To view a table that compares integer binary notation in several programming languages, see "Integer Binary Notation and Different Programming Languages" on page 36.

Example

```sas
data _null_
  x=input('0100'x,pibr2.);
  y=input('0001'x,pibr2.);
  put x  y;
run;
```

You can use the INPUT statement and specify the PIBR informat. However, these examples use the informat with the INPUT function, where binary input values are described using a hexadecimal literal.

<table>

PKw.d Informat

Reads unsigned packed decimal data.

**Categories:**
- CAS
- Numeric

**Interaction:**
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.
Syntax

PKw.d

Syntax Description

w

specifies the number of bytes of unsigned packed decimal data. Each byte contains two digits.

Default 1

Range 1–16

d

specifies the power of 10 by which to divide the value. This argument is optional.

Range 0–10

Details

Each byte of unsigned packed decimal data contains two digits.

Comparisons

The PKw.d informat is the same as the PDw.d informat, except that PKw.d treats the sign half of the field's last byte as part of the value, not as the sign of the value.

Example

The variable in this example is a hexadecimal representation of a binary number stored in unsigned packed decimal form.

```sas
data _null_;  
a='001234'x;  
b=input(a, pk3.);  
put b=;  
run;
```

SAS writes the following to the log:

```
b=1234
```

PUNCH.d Informat

Reads whether a row of column-binary data is punched.

Categories:

CAS

Column Binary
Syntax

PUNCH.d

Syntax Description

\( d \)

specifies which row in a card column to read.

Range \( 1–12 \)

Details

Column-binary data storage compresses data so that more than 80 items of data can be stored on a single “virtual” punch card.

This informat assigns the value 1 to the variable if row \( d \) of the current card column is punched, or 0 if row \( d \) of the current card column is not punched. After PUNCH.d reads a field, the pointer does not advance to the next column.

Example

```
data one;
  input x punch.12;
  put x;
  datalines;
  12-7-8
;
run;
```

SAS writes the following output to the log:

```
1
```

RBw.d Informat

Reads numeric data that is stored in real binary (floating-point) notation.

Categories: CAS
           Numeric
Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

See: “RB Informat: UNIX” in SAS Companion for UNIX Environments
     “RBw.d Informat: Windows” in SAS Companion for Windows
     “RBw.d Informat: z/OS” in SAS Companion for z/OS

Syntax

RBw.d

Syntax Description

**w**

specifies the width of the input field.

Default 4

Range 2–8

**d**

specifies the power of 10 by which to divide the value. This argument is optional.

Range 0–10

Details

Note: Different operating environments store real binary values in different ways. However, the RBw.d informat reads real binary values with consistent results if the values are created on the same type of operating environment that you use to run SAS.

Comparisons

The following table compares the names of real binary notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>4 Bytes</th>
<th>8 Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>RB4.</td>
<td>RB8.</td>
</tr>
<tr>
<td>Fortran</td>
<td>REAL*4</td>
<td>REAL*8</td>
</tr>
<tr>
<td>C</td>
<td>float</td>
<td>double</td>
</tr>
<tr>
<td>IBM 370 assembler</td>
<td>F</td>
<td>D</td>
</tr>
<tr>
<td>PL/I</td>
<td>FLOAT BIN(21)</td>
<td>FLOAT BIN(53)</td>
</tr>
</tbody>
</table>
CAUTION
Using the RBw.d informat to read real binary information on equipment that conforms to the IEEE standard for floating-point numbers results in a truncated 8-byte number (double-precision) instead of a true 4-byte floating-point number (single-precision).

Example
This example uses a hexadecimal representation of a real binary (floating-point) number.

```sas
data _null_;
a='0000000000006040'x;
b=input(a, rb8.);
put b=;
run;
```

SAS writes the following output to the log:

```
b=128
```

See Also

Informats:
- "IEEEw.d Informat" on page 583

RMFDURw. Informat
Reads duration intervals of RMF records.

Categories: CAS
Date and Time

Syntax

```sas
RMFDURw.
```

Syntax Description

- `w` specifies the width of the input field.

Requirement: `w` must be 4 because packed decimal duration values in RMF records contain 4 bytes of information.
Details

The RMFDURw. informat reads the duration of RMF measurement intervals of RMF records that are produced as packed decimal data by IBM mainframe systems. Then, the RMFDURw. informat converts the measurement intervals to SAS time values.

The general form of the duration interval data in an RMF record in hexadecimal notation is \textit{mmssttF}:

- \textit{mm} is the 1-byte representation of two digits that correspond to minutes.
- \textit{ss} is the 1-byte representation of two digits that correspond to seconds.
- \textit{ttt} is the 1 1/2-byte representation of three digits that correspond to thousandths of a second.
- \textit{F} is a half byte that contains all binary 1s, which assigns the value as positive.

If the field does not contain packed decimal data, RMFDURw. results in a missing value.

Comparisons

- Both the RMFDURw. informat and the RMFSTAMPw. informat read packed decimal information from RMF records that are produced by IBM mainframe systems.
- The RMFDURw. informat reads duration data and results in a time value.
- The RMFSTAMPw. informat reads time-of-day data and results in a datetime value.

Example

The variable is a hexadecimal representation of a binary duration value that is stored in packed decimal form as it would appear in an RMF record. Each byte occupies one column of the input field. The result is a SAS time value that corresponds to 00:35:52.226.

```sas
data _null_;
a=input('3552226F'x,rmfdur4.);
put a=;
run;
```

SAS writes the following to the log:

```
a=2152.226
```

See Also

**Informats:**

- "RMFSTAMPw. Informat" on page 610
RMFSTAMPw. Informat

Reads time and date fields of RMF records.

Categories:
- CAS
- Date and Time

Syntax

**RMFSTAMPw.**

Syntax Description

*w*

specifies the width of the input field.

**Requirement**

*w* must be 8 because packed decimal time and date values in RMF records contain 8 bytes of information: 4 bytes of time data that are followed by 4 bytes of date data.

Details

The RMFSTAMPw. informat reads packed decimal time and date values of RMF records that are produced by IBM mainframe systems. Then, the RMFSTAMPw. informat converts the time and date values to SAS datetime values.

The general form of the time and date information in an RMF record in hexadecimal notation is \(0\text{hhmmssFccyydddF}\):

- \(0\) is the half byte that contains all binary 0s.
- \(hh\) is the 1-byte representation of two digits that correspond to the hour of the day.
- \(mm\) is the 1-byte representation of two digits that correspond to minutes.
- \(ss\) is the 1-byte representation of two digits that correspond to seconds.
- \(cc\) is the 1-byte representation of two digits that correspond to the century.
- \(yy\) is the 1-byte representation of two digits that correspond to the year.
- \(ddd\) is the 1 1/2- bytes that contain three digits that correspond to the day of the year.
- \(F\) is the half byte that contains all binary 1s.

The century indicators 00 correspond to 1900, 01 to 2000, and 02 to 2100.
RMFSTAMPw. enables you to read, in any operating environment, packed decimal time and date values from files that are created on an IBM mainframe.

Comparisons

Both the RMFSTAMPw. informat and the PDTIMEw. informat read packed decimal values from RMF records. The RMFSTAMPw. informat reads both time and date values and results in a SAS datetime value. The PDTIMEw. informat reads only time values and results in a SAS time value.

Example

The variable is a hexadecimal representation of a binary time and date value that is stored in packed decimal form as it would appear in an RMF record. Each byte occupies one column of the input field. The result is a SAS datetime value that corresponds to July 18, 2018, 2:22.25 PM.

```
data one;
  input x $hex16.;
y=input(x,rmfstamp8.);
put y;
put y datetime16.;
datalines;
0142225F2618200F
;
run;
```

SAS writes the following output to the log:

```
80739901345
18JUL18:14:22:25
```

ROWw.d Informat

Reads a column-binary field down a card column.

Category: Column Binary

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

```
ROWw.d
```

Syntax Description

- **w** specifies the row where the field begins.

  Range: 0–12
**d**
specifies the length in rows of the field.

Default 0
Range 0–25

**Details**
Column-binary data storage compresses data so that more than 80 items of data
can be stored on a single "virtual" punch card.

The ROW\(w.d\) informat assigns the relative position of the punch in the field to a
numeric variable.

If the field that you specify has more than one punch, ROW\(w.d\) assigns the variable
a missing value and sets the automatic variable _ERROR_ to 1. If the field has no
punches, ROW\(w.d\) assigns the variable a missing value.

ROW\(w.d\) can read fields across columns, continuing with row 12 of the new column
and going down through the rest of the rows. After ROW\(w.d\) reads a field, the
pointer moves to the next row.

**Example**

```plaintext
input x row5.3
input x row7.1
input x row5.2
input x row3.5
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0</td>
</tr>
<tr>
<td>04</td>
<td>3</td>
</tr>
<tr>
<td>01</td>
<td>1</td>
</tr>
<tr>
<td>03</td>
<td>.</td>
</tr>
<tr>
<td>05</td>
<td>5</td>
</tr>
</tbody>
</table>

1 The variable is a hexadecimal representation of the column binary. The "virtual" punch card column
for the example data has row 7 punched. The binary representation is 0000 0000 0000 0100.

**See Also**
- “How to Read Column-Binary Data” in SAS Language Reference: Concepts

**Informs:**
- “$CBw. Informat” on page 513
- “CBw.d Informat” on page 555
S370FFw.d Informat

Reads EBCDIC numeric data.

Categories:
- CAS
- Numeric

Syntax

S370FFw.d

Syntax Description

w
  specifies the width of the input field.

  Default: 12
  Range: 1–32

d
  specifies the power of 10 by which to divide the value. This argument is optional.

  Range: 0–31

Details

The S370FFw.d informat reads numeric data that is represented in EBCDIC and converts the data to native format. If EBCDIC is the native format, S370FFw.d performs no conversion.

S370FFw.d reads EBCDIC numeric values that are represented with 1 byte per digit. Use S370FFw.d in other operating environments to read numeric data from IBM mainframe files.

S370FFw.d reads numeric values located anywhere in the input field. EBCDIC blanks can precede or follow a numeric value with no effect. If a value is negative, an EBCDIC minus sign should immediately precede the value. S370FFw.d reads values with EBCDIC decimal points and values in scientific notation, and it interprets a single EBCDIC period as a missing value.

Comparisons

The S370FFw.d informat performs the same role for numeric data that the $EBCDICw.d informat does for character data. That is, on an IBM mainframe system, S370FFw.d has the same effect as the standard w.d informat. On all other systems, using S370FFw.d is equivalent to using $EBCDICw.d as well as using the standard w.d informat.
Example

The variables are hexadecimal representations of codes for characters. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one character value.

```sas
data _null_;
a=input('F1F2F3'x,s370ff3.);
b=input('F2F4F0'x,s370ff3.);
put a= b=;
run;
```

SAS writes the following to the log:

```
a=123 b=240
```

S370FIBw.d Informat

Reads integer binary (fixed-point) values, including negative values, in IBM mainframe format.

**Categories:**
- CAS
- Numeric

**Interaction:**
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

`S370FIBw.d`

**Syntax Description**

`w`

specifies the width of the input field.

- **Default:** 4
- **Range:** 1–8

`d`

specifies the power of 10 by which to divide the value. This argument is optional.

- **Range:** 0–10

**Details**

The S370FIBw.d informat reads integer binary (fixed-point) values that are stored in IBM mainframe format, including negative values that are represented in two's complement notation. S370FIBw.d reads integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.
Use S370FIBw.d for integer binary data that is created in IBM mainframe format for reading in other operating environments.

**Note:** Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 480.

**Comparisons**

- If you use SAS on an IBM mainframe, S370FIBw.d and IBw.d are identical.
- S370FPIBw.d, S370FIBUw.d, and S370FIBw.d are used to read big endian integers in any operating environment.
  
  To view a table that shows the type of informat to use with big endian and little endian integers, see “Reading Data Generated on Big Endian and Little Endian Platforms” on page 480.
  
  To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

**Example**

You can use the INPUT statement and specify the S370FIB informat. However, this example uses the informat with the INPUT function, where the binary input value is described using a hexadecimal literal.

```sas
data _null_;  
a=input('0080'x,s370fib2.);
put a=;
run;
```

SAS writes the following to the log:

| a=128 |

**See Also**

**Informats**

- “S370FIBUw.d Informat” on page 615
- “S370FPIBw.d Informat” on page 620

---

**S370FIBUw.d Informat**

Reads unsigned integer binary (fixed-point) values in IBM mainframe format.

**Categories:** CAS  
Numeric
Interaction: List input is incompatible with binary input when this informat is specified in an 
INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. 
SAS issues a warning and uses formatted input to read the data.

Syntax

S370FIBUw.d

Syntax Description

w
specifies the width of the input field.

Default 4
Range 1–8

d
specifies the power of 10 by which to divide the value. SAS uses the d value
even if the data contains decimal points. This argument is optional.

Range 0–10

Details

The S370FIBUw.d informat reads unsigned integer binary (fixed-point) values that
are stored in IBM mainframe format, including negative values that are represented
in two's complement notation. Unsigned integer binary values are the same as
integer binary values, except that all values are treated as positive. S370FIBUw.d
reads integer binary values with consistent results if the values are created in the
same type of operating environment that you use to run SAS.

Use S370FIBUw.d for unsigned integer binary data that is created in IBM mainframe
format for reading in other operating environments.

Note: Different operating environments store integer binary values in different
ways. This concept is called byte ordering. For a detailed discussion about byte
ordering, see "Byte Ordering for Integer Binary Data on Big Endian and Little Endian
Platforms" on page 480.

Comparisons

- The S370FIBUw.d informat is equivalent to the COBOL notation PIC 9(n)
  BINARY, where n is the number of digits.
- The S370FIBUw.d and S370FPIBw.d informats are identical.
- S370FPIBw.d, S370FIBUw.d, and S370FIBw.d are used to read big endian
  integers in any operating environment.

To view a table that shows the type of informat to use with big endian and little
endian integers, see "Reading Data Generated on Big Endian and Little Endian
Platforms" on page 480.
To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

You can use the INPUT statement and specify the S370FIBU informat. However, these examples use the informat with the INPUT function, where binary input values are described using a hexadecimal literal.

```sas
data _null_
result1=input('7F'x,s370fibu1.);
result2=input('F6'x,s370fibu1.);
put result1 +1 result2;
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put result1;</td>
<td>result1=127</td>
</tr>
<tr>
<td>put result2;</td>
<td>result2=246</td>
</tr>
</tbody>
</table>

**S370FPDw.d Informat**

Reads packed data in IBM mainframe format.

**Categories:**
- CAS
- Numeric

**Interaction:**
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

**S370FPDw.d**

**Syntax Description**

- `w` specifies the width of the input field.
**Default** 1
**Range** 1–16

**Details**

Packed decimal data contains two digits per byte, but only one digit in the input field represents the sign. The last half of the last byte indicates the sign: a C or an F for positive numbers and a D for negative numbers.

Use S370FPw.d to read packed decimal data from IBM mainframe files in other operating environments.

**Comparisons**

- If you use SAS on an IBM mainframe, the S370FPw.d and PDw.d informats are identical.
- The following table compares the equivalent packed decimal notation by programming language:

<table>
<thead>
<tr>
<th>Language</th>
<th>Packed Decimal Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>S370FPD4.</td>
</tr>
<tr>
<td>PL/I</td>
<td>FIXED DEC(7,0)</td>
</tr>
<tr>
<td>COBOL</td>
<td>COMP-3 PIC 9(7)</td>
</tr>
<tr>
<td>assembler</td>
<td>PL4</td>
</tr>
</tbody>
</table>

**Example**

The variable in this example is a hexadecimal representation of a binary number that is stored in packed decimal form. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

```sas
data _null_;  
a=input('12345F'x,s370fpd3.);
put a=;
run;
```

SAS writes the following to the log:

```
a=12345
```
S370FPDUw.d Informat

Reads unsigned packed decimal data in IBM mainframe format.

**Categories:**
- CAS
- Numeric

**Interaction:**
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

*S370FPDUw.d*

**Syntax Description**

- **w** specifies the width of the input field.
  - Default: 1
  - Range: 1–16

- **d** specifies the power of 10 by which to divide the value. This argument is optional.
  - Default: 0
  - Range: 0–31

**Details**

Packed decimal data contains two digits per byte. The last half of the last byte, which indicates the sign for signed packed data, is always F for unsigned packed data.

Use S370FPDUw.d in other operating environments to read unsigned packed decimal data from IBM mainframe files.

**Comparisons**

- The S370FPDUw.d informat is similar to the S370FPDw.d informat, except that the S370FPDUw.d informat rejects all sign digits except F.
- The S370FPDUw.d informat is equivalent to the COBOL notation PIC 9(n) PACKED-DECIMAL, where n is the number of digits.

**Example**

```input @1 x s370fpdu3.;```
The variable is a hexadecimal representation of a binary number that is stored in packed decimal form. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

---

S370FPIBw.d Informat

Reads positive integer binary (fixed-point) values in IBM mainframe format.

Categories: CAS
             Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

S370FPIBw.d

Syntax Description

w
  specifies the width of the input field.

  Default 4
  Range  1–8

d
  specifies the power of 10 by which to divide the value. This argument is optional.

  Default 0
  Range  0–10

Details

Positive integer binary values are the same as integer binary values, except that all values are treated as positive. S370FPIBw.d reads integer binary values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Use S370FPIBw.d for positive integer binary data that is created in IBM mainframe format for reading in other operating environments.
Note: Different operating environments store integer binary values in different ways. This concept is called byte ordering. For a detailed discussion about byte ordering, see “Byte Ordering for Integer Binary Data on Big Endian and Little Endian Platforms” on page 480.

Comparisons

- If you use SAS on an IBM mainframe, S370FPIBw.d and PIBw.d are identical.
- S370FPIBw.d, S370FIBUw.d, and S370FIBw.d are used to read big endian integers in any operating environment.

To view a table that shows the type of informat to use with big endian and little endian integers, see “Reading Data Generated on Big Endian and Little Endian Platforms” on page 480.

To view a table that compares integer binary notation in several programming languages, see “Integer Binary Notation and Different Programming Languages” on page 36.

Example

You can use the INPUT statement and specify the S370FPIB informat. However, this example uses the informat with the INPUT function, where the binary input value is described using a hexadecimal literal.

```sas
data _null_;  
  result=input('0100',s370fpib2.);  
  put result;  
run;
```

<table>
<thead>
<tr>
<th>SAS Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put result;</td>
<td>12337</td>
</tr>
</tbody>
</table>

**S370FRBw.d Informat**

Reads real binary (floating-point) data in IBM mainframe format.

**Categories:**
- CAS
- Numeric
List input is incompatible with binary input when this informat is specified in an
INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument.
SAS issues a warning and uses formatted input to read the data.

Syntax

S370FRBw.d

Syntax Description

w
specifies the width of the input field.
Default 4
Range 2–8

d
specifies the power of 10 by which to divide the value. This argument is optional.
Range 0–10

Details

Real binary values are represented in two parts: a mantissa that gives the value,
and an exponent that gives the value's magnitude.

Use S370FRBw.d to read real binary data from IBM mainframe files in other
operating environments.

Comparisons

- If you use SAS on an IBM mainframe, S370FRBw.d and RBw.d are identical.
- The following table shows the equivalent real binary notation for several
  programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>4 Bytes</th>
<th>8 Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>PL/I</td>
<td>FLOAT BIN(21)</td>
<td>FLOAT BIN(53)</td>
</tr>
<tr>
<td>Fortran</td>
<td>REAL*4</td>
<td>REAL*8</td>

</tbody>
</table>
S370FZDw.d Informat

Reads zoned decimal data in IBM mainframe format.

Categories: CAS
          Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

\texttt{S370FZDw.d}

Syntax Description

\texttt{w}

specifies the width of the input field.

\begin{itemize}
  \item Default: 8
  \item Range: 1–32
\end{itemize}

\texttt{d}

specifies the power of 10 by which to divide the value. If the data contains decimal points, the \texttt{d} value is ignored. This argument is optional.

\begin{itemize}
  \item Default: 0
  \item Range: 0–31
\end{itemize}

Details

Zoned decimal data is similar to standard decimal data in that every digit requires 1 byte. However, the value's sign is stored in the last byte, along with the last digit.

Use S370FZDw.d in other operating environments to read zoned decimal data from IBM mainframe files.

Comparisons

- If you use SAS on an IBM mainframe, S370FZDw.d and ZDw.d are identical.

</tr>
</tbody>
</table>

Example
The variable contains a hexadecimal representation of a binary number stored in zoned decimal format in an IBM mainframe operating environment. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

```sas
data _null_;  
a=input('F1F2C3'x,s370fzd3.);  
b=input('F1F2D3'x,s370fzd3.);  
put a= b=;  
run;
```

SAS writes the following to the log:

```
a=123 b=-123
```

- “ZDBw.d Informat: z/OS” in SAS Companion for z/OS
Syntax

\texttt{S370FZBDw.d}

Syntax Description

\texttt{w}

specifies the width of the input field.

Default \hspace{0.5cm} 8

Range \hspace{0.5cm} 1–32

\texttt{d}

specifies the power of 10 by which to divide the value. This argument is optional.

Default \hspace{0.5cm} 0

Range \hspace{0.5cm} 0–31

Details

Use the \texttt{S370FZDBw.d} informat in other operating environments to read zoned decimal data from IBM mainframe files.

Example

The variables contain a hexadecimal representation of a binary number that is stored in zoned decimal format in an IBM mainframe operating environment. Two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

\begin{verbatim}
data _null_;  
a=input('40404040F14040C0'x,s370fzdb8.);  
b=input('4040404040F1F2D3'x,s370fzdb8.);  
put a= b=;  
run;
\end{verbatim}

SAS writes the following to the log:

\begin{verbatim}
a=1000 b=-123
\end{verbatim}

\section*{S370FZDLw.d Informat}

Reads zoned decimal leading-sign data in IBM mainframe format.

Categories:

\begin{itemize}
  \item CAS
  \item Numeric
\end{itemize}

Interaction:

List input is incompatible with binary input when this informat is specified in an \texttt{INFORMAT=} statement or an \texttt{ATTRIB=} statement that uses the \texttt{INFORMAT=} argument. SAS issues a warning and uses formatted input to read the data.
Syntax

*S370FZDLw.d*

Syntax Description

w

specifies the width of the input field.

Default  8

Range  1–32

d

specifies the power of 10 by which to divide the value. This argument is optional.

Default  0

Range  0–31

Details

Use S370FZDLw.d in other operating environments to read zoned decimal data from IBM mainframe files.

Comparisons

- Zoned decimal leading-sign data is similar to standard zoned decimal data, except that the sign of the value is stored in the first byte of zoned decimal leading-sign data, along with the first digit.

- The S370FZDLw.d informat is equivalent to the COBOL notation PIC S9(n) DISPLAY SIGN LEADING, where n is the number of digits.

Example

The variables contain a hexadecimal representation of a binary number stored in zoned decimal format in an IBM mainframe operating environment. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

```sas
data _null_;  
a=input('C1F2F3'x,s370fzdl3.);  
b=input('D1F2F3'x,s370fzdl3.);  
put a= b=;  
run;
```

SAS writes the following to the log:

```
a=123 b=-123
```
S370FZDSw.d Informat

Reads zoned decimal, separate leading-sign data in IBM mainframe format.

Categories:
- CAS
- Numeric

Interaction:
List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax
S370FZDSw.d

Syntax Description

\( w \)

specifies the width of the input field.

- Default: 8
- Range: 2–32

\( d \)

specifies the power of 10 by which to divide the value. This argument is optional.

- Default: 0
- Range: 0–31

Details

Use S370FZDSw.d in other operating environments to read zoned decimal data from IBM mainframe files.

Comparisons

- Zoned decimal, separate leading-sign data is similar to standard zoned decimal data, except that the sign of the value is stored in the first byte of zoned decimal, leading-sign data, and the first digit of the value is stored in the second byte.

- The S370FZDSw.d informat is equivalent to the COBOL notation PIC S9(\(n\)) DISPLAY SIGN LEADING SEPARATE, where \(n\) is the number of digits.

Example

The variable contains a hexadecimal representation of a binary number that is stored in zoned decimal format in an IBM mainframe operating environment. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.
data _null_;  
a=input('4EF1F2F3'x,s370fzds4.);  
b=input('60F1F2F3'x,s370fzds4.);  
put a= b=;  
run;

SAS writes the following to the log:

| a=123 | b=-123 |

---

### S370FZDTw.d Informat

Reads zoned decimal, separate trailing-sign data in IBM mainframe format.

**Categories:**

- CAS
- Numeric

**Interaction:**

List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

\[ \text{S370FZDT}w.d \]

**Syntax Description**

- **w**
  - specifies the width of the input field.
  - Default: 8
  - Range: 2–32

- **d**
  - specifies the power of 10 by which to divide the value. This argument is optional.
  - Default: 0
  - Range: 0–31

**Details**

Use S370FZDTw.d in other operating environments to read zoned decimal data from IBM mainframe files.

**Comparisons**

- Zoned decimal, separate trailing-sign data is similar to zoned decimal, separate leading-sign data, except that the sign of the value is stored in the last byte of zoned decimal, separate trailing-sign data.
The S370FZDTw.d informat is equivalent to the COBOL notation PIC S9(n)
DISPLAY SIGN TRAILING SEPARATE, where n is the number of digits.

Example
The variable contains a hexadecimal representation of a binary number that is
stored in zoned decimal format in an IBM mainframe operating environment. Each
two hexadecimal characters correspond to 1 byte of binary data, and each byte
corresponds to one column of the input field.

```sas
data _null_
  a=input('F1F2F34E'x,s370fzdt4.);
  b=input('F1F2F360'x,s370fzdt4.);
  put a= b=;
run;
```

SAS writes the following to the log:

```
a=123 b=-123
```

S370FZDUw.d Informat
Reads unsigned zoned decimal data in IBM mainframe format.

Categories: CAS
Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an
INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument.
SAS issues a warning and uses formatted input to read the data.

Syntax

```
S370FZDUw.d
```

Syntax Description

- **w**
  - Specifies the width of the input field.
  - Default: 8
  - Range: 1–32

- **d**
  - Specifies the power of 10 by which to divide the value. This argument is optional.
  - Default: 0
  - Range: 0–31
Details

Use S370FZDUw.d in other operating environments to read unsigned zoned decimal data from IBM mainframe files.

Comparisons

- The S370FZDUw.d informat is similar to the S370FZDw.d informat, except that the S370FZDUw.d informat rejects all sign digits except F.

- The S370FZDUw.d informat is equivalent to the COBOL notation PIC 9(n) DISPLAY, where n is the number of digits.

Example

The variable contains a hexadecimal representation of a binary number that is stored in zoned decimal format in an IBM mainframe operating environment. Each two hexadecimal characters correspond to 1 byte of binary data, and each byte corresponds to one column of the input field.

```sas
data _null_;  
a=input('F1F2F3'x,s370fzdu3.);  
put a=;  
run;
```

SAS writes the following to the log:

```
a=123
```

---

**SHRSTAMPw. Informat**

Reads date and time values of SHR records.

**Categories:**  
CAS  
Date and Time

**Syntax**

`SHRSTAMPw.`

**Syntax Description**

`w`

specifies the width of the input field.

**Requirement**

`w` must be 8 because packed decimal date and time values in SHR records contain 8 bytes of information: 4 bytes of date data that are followed by 4 bytes of time data.
Details

The SHRSTAMP informat reads packed decimal date and time values of SHR records that are produced by IBM mainframe environments. Then, the SHRSTAMP format converts the date and time values to SAS datetime values.

The general form of the date and time information in an SHR record in hexadecimal notation is `ccyydddFhhmmsth`. The letters are defined as follows:

- **ccyy**: is the 2-byte representation of the year. The `cc` portion is the 1-byte representation of a two-digit integer that represents the century. The `yy` portion is the 1-byte representation of two digits that correspond to the year. The `cc` portion is the century indicator where 00 indicates 19yy, 01 indicates 20yy, 02 indicates 21yy, and so on. A hexadecimal year value of 0115 is equal to the year 2015.
- **ddd**: is the 1 1/2 bytes that contain three digits that correspond to the day of the year.
- **F**: is the half-byte that contains all binary 1s.
- **hh**: is the 1-byte representation of two digits that correspond to the hour of the day.
- **mm**: is the 1-byte representation of two digits that correspond to minutes.
- **ss**: is the 1-byte representation of two digits that correspond to seconds.
- **th**: is the 1-byte representation of two digits that correspond to a 100th of a second.

The SHRSTAMP informat enables you to read, in any operation environment, packed decimal date and time values from files that are created on an IBM mainframe.

Example

```sas
data values;
    shrstamp=input('0218239F12403576'x,shrstamp8.);
    put shrstamp ;
    put shrstamp datetime.;
run;
```

<table>
<thead>
<tr>
<th>Variable1</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put shrstamp ;</td>
<td>5006666435.8</td>
</tr>
<tr>
<td>put shrstamp datetime.;</td>
<td>27AUG18:12:40:36</td>
</tr>
</tbody>
</table>

1 The variable is a hexadecimal representation of a packed decimal date and time value that is stored as it would appear in an SHR record. Each byte occupies one column of the input field. The result is a SAS datetime value that corresponds to August 27, 2018 12:40:36.
SMFSTAMP\(w\). Informat

Reads time and date values of SMF records.

Categories:

- CAS
- Date and Time

Syntax

\texttt{SMFSTAMP\(w\).}

Syntax Description

\(w\)

specifies the width of the input field.

Requirement \(w\) must be 8 because time and date values in SMF records contain 8 bytes of information: 4 bytes of time data that are followed by 4 bytes of date data.

Tip

The time portion of an SMF record is a 4-byte integer binary number that represents time as the number of hundredths of a second past midnight.

Details

The SMFSTAMP\(w\). informat reads integer binary time values and packed decimal date values of SMF records that are produced by IBM mainframe systems. Then, the SMFSTAMP\(w\). informat converts the time and date values to SAS datetime values.

The date portion of an SMF record in hexadecimal notation is \texttt{ccyydddF}.

- \(cc\) is the 1-byte representation of two digits that correspond to the century.
- \(yy\) is the 1-byte representation of two digits that correspond to the year.
- \(ddd\) is the 1 1/2 bytes that contain three digits that correspond to the day of the year.
- \(F\) is the half byte that contains all binary 1s.

The SMFSTAMP\(w\). informat enables you to read, in any operating environment, integer binary time values and packed decimal date values from files that are created on an IBM mainframe.

Example

```r
data one;
    input x: $hex16.;
    y=input(x, smfstamp8.);
```
put y;
put y datetime16.;
datalines;
0058DC0C0108200F
;
run;

<table>
<thead>
<tr>
<th>Variable</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put y ;</td>
<td>1532016635</td>
</tr>
<tr>
<td>put y datetime;</td>
<td>18JUL08:16:10:35</td>
</tr>
</tbody>
</table>

1 The variable is a hexadecimal representation of a binary time and date value stored as it would appear in an SMF record. Each byte occupies one column of the input field. The result is a SAS datetime value that corresponds to July 18, 2018, 4:10:35 PM.

---

STIMERw. Informat

Reads time values and determines whether the values are hours, minutes, or seconds; reads the output of the STIMER system option.

Category: Date and Time
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

STIMERw.

Syntax Description

w

specifies the width of the input field.

Default 10
Range 1–32

Details

The STIMER informat reads performance statistics that the STIMER system option writes to the SAS log.

The informat reads time values and determines whether the values are hours, minutes, or seconds based on the presence of decimal points and colons:

- If no colon is present, the value is the number of seconds.
- If a single colon is present, the value before the colon is the number of minutes. The value after the colon is the number of seconds.
If two colons are present, the sequence of time is hours, minutes, and then seconds.

In all cases, the result is a SAS time value.

The input values for `STIMER` must be in one of these forms:

- `ss`
- `ss.ss`
- `mm:ss`
- `mm:ss.ss`
- `hh:mm:ss`
- `hh:mm:ss.ss`

- `ss` is an integer that represents the number of seconds.
- `mm` is an integer that represents the number of minutes.
- `hh` is an integer that represents the number of hours.

**Example**

```sas
data one;
  input test stimer10.;
  put test=;
  datalines;
  234
  333.4444
  1846989
  83769.6
  202
; run;
```

SAS writes the following output to the log:

```
test=234
test=333.4444
test=1846989
test=83769.6
test=202
```

**TIMEw. Informat**

Reads hours, minutes, and seconds in the form `hh:mm:ss.ss`, where special characters such as the colon (:) or the period (.) are used to separate the hours, minutes, and seconds.

**Categories:**
- CAS
- Date and Time
Syntax

**TIME\(w\).**

Syntax Description

\(w\)

specifies the width of the input field.

- **Default**: 8
- **Range**: 5–32

Details

The `TIME\(w\).` informat reads SAS time values in the form `hh:mm:ss<.ss> <AM | PM>`.  

- `hh` is an integer that represents the number of hours.  
- `:` represents a special character that separates hours, minutes, and seconds.  
- `mm` is an integer between 00 and 59 that represents minutes.  
- `ss<.ss>` is an integer that represents the number of seconds, and if needed, tenths of a second. Seconds and tenths of a second must always be separated by a period.  
- `AM | PM`  
  - AM indicates time between 12:00 midnight and 11:59 in the morning.  
  - PM indicates time between 12:00 noon and 11:59 at night.  

Separate `hh`, `mm`, and `ss` with a special character. When the period is used as the special character, the time is interpreted in the order hours, minutes, and seconds.  

For example, 23.22 is 23 hours and 22 minutes, not 23 minutes and 22 seconds, or 23 seconds and 22 tenths of a second.  

If you do not enter a value for seconds, SAS assumes a value of 0.  

The stored value is the total number of seconds in the time value.

Example

```sas
data test;
  time='12:56';
  sastime=input(time,time.);
  put sastime ;
  put sastime time8.;
run;
```

SAS writes the following output to the log:

```
46560
12:56:00
```

---

**TODSTAMPw. Informat**

Reads an 8-byte time-of-day stamp.

**Categories:**
- CAS
- Date and Time

**Syntax**

```
TODSTAMPw.
```

**Syntax Description**

`w`

specifies the width of the input field.

**Requirement**

`w` must be 8 because the OS TIME macro or the STCK instruction on IBM mainframes each returns an 8-byte value.

**Details**

The TODSTAMPw. informat reads time-of-day clock values that are produced by IBM mainframe operating systems and converts the clock values to SAS datetime values.

If the time-of-day value is all 0s, TODSTAMPw. results in a missing value.

Use TODSTAMPw. in other operating environments to read time-of-day values that are produced by an IBM mainframe.
Example
This example uses a SAS datetime value that corresponds to September 9, 2018, 11:59:58.

```sas
data one;
  date='D4E7F43876B80000'x;
  dt2=input(date,todstamp8.);
  put dt2 /
       dt2 datetime20.;
run;
```

SAS writes the following output to the log:

```
1852113598
09SEP2018:11:59:58
```

TRAILSGNw. Informat
Reads a trailing plus (+) or minus (–) sign.

Categories:
- CAS
- Numeric

Syntax

```sas
TRAILSGNw.
```

Syntax Description

- `w` specifies the width of the input field.

  Default: 6
  Range: 1–32

Details

If the data contains a decimal point, the TRAILSGN informat honors the number of decimal places that are in the input data. If the data contains a comma, the TRAILSGN informat reads the value, ignoring the comma.

Example

```sas
data _null_;
a=input('1',trailsgn8.);
b=input('1,000',trailsgn8.);
c=input('1+',trailsgn8.);
d=input('1-',trailsgn8.);
```
TUw. Informat

Reads timer units.

Categories:
- CAS
- Date and Time

Syntax

**TUw.**

Syntax Description

**w**

specifies the width of the input field.

Requirement  
**w** must be 4 because the OS TIME macro returns a 4-byte value.

Details

The **TUw.** informat reads timer unit values that are produced by IBM mainframe operating environments and converts the timer unit values to SAS time values.

There are exactly 38,400 software timer units per second. The low-order bit in a timer unit value represents approximately 26.041667 microseconds.

Use the **TUw.** informat to read timer unit values that are produced by an IBM mainframe in other operating environments.

Example

The variable is a hexadecimal representation of a binary, 4-byte timer unit value. Each byte occupies one column of the input field. The result is a SAS time value that corresponds to 5:26:58.41 p.m.

```sas
data _null_;  
a=input('8FC7A9BC'x,tu4.);  
put a=;  
r
```
VAXRBw.d Informat

Reads real binary (floating-point) data in VMS format.

Categories: CAS
          Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

VAXRBw.d

Syntax Description

w
specifies the width of the input field.

Default  4
Range    2–8

d
specifies the power of 10 by which to divide the value. This argument is optional.

Range   0–10

Details

Use the VAXRBw.d informat to read floating-point data from VMS files in other operating environments.

Comparisons

If you use SAS that is running under VMS, the VAXRBw.d and the RBw.d informats are identical.

See Also

Informats:

* "RBw.d Informat" on page 606
VMSZNw.d Informat
Reads VMS and MicroFocus COBOL zoned numeric data.

Categories: CAS
Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

Syntax

VMSZNw.d

Syntax Description

w
specifies the width of the output field.

Default 1
Range 1–32

d
specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

Details

The VMSZNw.d informat is similar to the ZDw.d informat. Both read a string of ASCII digits, and the last digit is a special character denoting the magnitude of the last digit and the sign of the entire number. The difference between the VMSZNw.d informat and the ZDw.d informat is in the special character used for the last digit. The following table shows the special characters used by the VMSZNw.d informat.

<table>
<thead>
<tr>
<th>Desired Digit</th>

w.d Informat

Reads standard numeric data.

Categories:  
CAS  
Numeric

Alias:  
BESTw.d, Dw.d, Ew.d, Fw.d

Syntax

w.d

Syntax Description

w  
specifies the width of the input field.
**Range** 1–32

*d* specifies the power of 10 by which to divide the value. If the data contains decimal points, the *d* value is ignored. This argument is optional.

**Range** 0–31

**Details**

The *w.d* informat reads numeric values that are located anywhere in the field. Blanks can precede or follow a numeric value with no effect. A minus sign with no separating blank should immediately precede a negative value. The *w.d* informat reads values with decimal points and values in scientific E notation, and it interprets a single period as a missing value.

**Comparisons**

- The *w.d* informat is identical to the BZ*w.d* informat, except that the *w.d* informat ignores trailing blanks in the numeric values. To read trailing blanks as 0s, use the BZ*w.d* informat.
- The *w.d* informat can read values in scientific E notation exactly as the E*w.d* informat does.

**Example**

```sas
data test;
  value='123.456';
  value2=input(value,8.3);
  put value2 ;
run;
```

SAS writes the following output to the log:

```
123.456
```

**WEEKUw. Informat**

Reads a value in the form of a week number within the year and returns a SAS date value by using the U algorithm.

**Category:** Date and Time

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

**Syntax**

```
WEEKUw.
```
Syntax Description

\texttt{w}

specifies the width of the input field.

Default 11

Range 3–200

Details

The \texttt{WEEKUw.} informat reads the week-number value within the year, and then returns a SAS date value by using the U algorithm. If the input does not contain a year expression, then \texttt{WEEKUw.} uses the current year as the year expression, which is the default. If the input does not contain a day expression, then \texttt{WEEKUw.} uses the first day of the week as the day expression, which is the default.

The U algorithm calculates the SAS date value by using the number-of-week value within the year. (Sunday is considered the first day of the week.) The number-of-week value is represented as a decimal number in the range 0–53, with a leading 0 and maximum value of 53. For example, the fifth week of the year would be represented as 05.

The inputs to the \texttt{WEEKUw.} informat are the same date for the following example. The current year is 2018.

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>3–4</td>
<td>\texttt{Www}</td>
<td>\texttt{w01}</td>
</tr>
<tr>
<td>5–6</td>
<td>\texttt{yyWww}</td>
<td>\texttt{18W01}</td>
</tr>
<tr>
<td>7–8</td>
<td>\texttt{yyWwwdd}</td>
<td>\texttt{18W0101}</td>
</tr>
<tr>
<td>9–10</td>
<td>\texttt{yyyyWwwdd}</td>
<td>\texttt{2018W0101}</td>
</tr>
<tr>
<td>11–200</td>
<td>\texttt{yyyy-Www-dd}</td>
<td>\texttt{2018-W01-01}</td>
</tr>
</tbody>
</table>

Comparisons

The \texttt{WEEKUw.} informat reads the week-number value as a decimal number in the range 0–53, with Sunday as the first day of the week.

The \texttt{WEEKVw.} informat reads the number-of-week value as a decimal number in the range 01–53, with Monday as the first day of the week. Week one of the year is the week that includes both January fourth and the first Thursday of the year. If the first Monday of January is the second, third, or fourth, the preceding days are part of the last week of the preceding year.

The \texttt{WEEKWw.} informat reads the week-number value as a decimal number in the range 00–53, with Monday as the first day of the week.

Example

The current year is 2018 in these examples.
data one;
  v=input('W01',weeku3.);
  w=input('18W01',weeku5.);
  x=input('18W0101',weeku7.);
  y=input('2018W0101',weeku9.);
  z=input('2018-W01-01',weeku11.);
  put v;
  put w;
  put x;
  put y;
  put z;
run;

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put v;</td>
<td>21555</td>
</tr>
<tr>
<td>put w;</td>
<td>21191</td>
</tr>
<tr>
<td>put x;</td>
<td>21191</td>
</tr>
<tr>
<td>put y;</td>
<td>21191</td>
</tr>
<tr>
<td>put z;</td>
<td>21191</td>
</tr>
</tbody>
</table>

WEEKVw. Informat

Reads a value in the form of a week number within a year and returns a SAS date value by using the V algorithm.

Category: Date and Time
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

WEEKVw.

Syntax Description

w

specifies the width of the input field.

Default  11

Range  3–200

Details

The WEEKVw. informat reads the week-number value within a year. If the input does not contain a year expression, WEEKVw. uses the current year as the year expression, which is the default. If the input does not contain a day expression, WEEKVw. uses the first day of the week as the day expression, which is the default.

The V algorithm calculates the SAS date value. The number-of-week value is represented as a decimal number in the range 01–53, with a leading 0 and a maximum value of 53. Weeks begin on a Monday, and week 1 of the year is the week that includes January 4 and the first Thursday of the year. If the first Monday of January is 2, 3, or 4, the preceding days are part of the last week of the preceding year. For example, the fifth week of the year would be represented as 06.

The inputs to the WEEKVw. informat are the same date for the following example. The current year is 2018.

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>3–4</td>
<td>www</td>
<td>w01</td>
</tr>
<tr>
<td>5–6</td>
<td>yywww</td>
<td>18w01</td>
</tr>
<tr>
<td>7–8</td>
<td>yywwdd</td>
<td>18w0101</td>
</tr>
<tr>
<td>9–10</td>
<td>yyyywwdd</td>
<td>2018w0101</td>
</tr>
<tr>
<td>11–200</td>
<td>yyyy-www-dd</td>
<td>2018–W01–01</td>
</tr>
</tbody>
</table>

Comparisons

The WEEKVw. informat reads the week-number value as a decimal number in the range 01–53, with Monday as the first day of the week. Week 1 of the year is the week that includes January 4 and the first Thursday of the year. If the first Monday of January is 2, 3, or 4, the preceding days are part of the last week of the preceding year.
The WEEKUw. informat reads the week-number value as a decimal number in the range 0–53, with Sunday as the first day of the week.

The WEEKWw. informat reads the week-number-of-year value as a decimal number in the range 00–53, with Monday as the first day of the week.

Example

The current year is 2018 in these examples.

data one;
  v=input('W01',weekv3.);
  w=input('18W01',weekv5.);
  x=input('18W0101',weekv7.);
  y=input('2018W0101',weekv9.);
  z=input('2018-W01-01',weekv11.);
  put v;
  put w;
  put x;
  put y;
  put z;
run;

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put v;</td>
<td>21549</td>

WEEKWw. Informat

Reads a value in the form of a week number within the year and returns a SAS date value by using the W algorithm.

Category: Date and Time

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

\texttt{WEEKWw.}

Syntax Description

\texttt{w}

specifies the width of the input field.

Default \hspace{1cm} \texttt{11}

Range \hspace{1cm} 3–200

Details

The WEEKWw. informat reads the week-number value within the year. If the input does not contain a year expression, the WEEKWw. informat uses the current year as the year expression, which is the default. If the input does not contain a day expression, the WEEKWw. informat uses the first day of the week as the day expression, which is the default. The W algorithm calculates the SAS date value by using the number of the week within the year. (Monday is considered the first day of the week.) The number-of-week value is represented as a decimal number in the range 0–53, with a leading 0 and maximum value of 53. For example, the fifth week of the year would be represented as 05.

The inputs to the WEEKWw. informat are the same date for the following example. The current year is 2018.

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>
</tr>

YMDDTTMw.d Informat

Reads datetime values in the form `<yy>yy-mm-dd hh:mm:ss.ss`, where special characters such as a hyphen (-), period (.), slash (/), or colon (:) are used to separate the year, month, day, hour, minute, and seconds. The year can be either two or four digits.

Category: Date and Time
Alignment: Right
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax
YMDDTTMw.d

Syntax Description

w
specifies the width of the output field.
Default 19
Range 13–40

d
specifies the number of digits to the right of the decimal point in the seconds value. The digits to the right of the decimal point specify a fraction of a second. This argument is optional.
Default 0
Range 0–39

Details

The YMDDTTMw.d format reads SAS datetime values in the form `<yy>yy-mm-dd hh:mm:ss.ss`: 

yy or yyyy
specifies a two- or four-digit integer that represents the year.

mm
is an integer between 01 and 12 that represents the month.
**dd**

is an integer between 01 and 31 that represents the day of the month.

**hh**

is an integer between 00 and 23 that represents hours.

**mm**

is an integer between 00 and 59 that represents minutes.

**ss.ss**

is the number of seconds ranging from 00–59 with the fraction of a second following the decimal point.

- or :  

represents one of several special characters such as the slash (/), hyphen (-), colon (:), or a blank character that can be used to separate date and time components. Special characters can be used as separators between any date or time component and between the date and the time.

**IMPORTANT**  If a fraction of a second is specified, the decimal point can be represented only by a period and is required.

**Comparisons**

The **YMDTDMw.d** informat reads datetime values with required separators in the form `<yy>yy-mm-dd/hh:mm:ss.ss`.

The **MDYAMPMw.d** informat reads datetime values with optional separators in the form `mm-dd-yy<yy> hh:mm:ss.ss AM | PM`, and requires a space between the date and the time.

The **DATETIMEw.d** informat reads datetime values with optional separators in the form `dd-mmm-yy<yy> hh:mm:ss.ss AM | PM`, and the date and time can be separated by a special character.

**Example**

```sas
data one;
  input dt ymdttm24.;
  put dt;
  put dt datetime24.;
datalines;
2018-03-16 11:23:07.4
2018 03 16 11 23 07.4
18.3.16/11:23
run;
```

SAS writes the following output to the log:

```
1836818587.4
16MAR2018:11:23:07
1836818580
16MAR2018:11:23:00
```
YYMMDDw. Informat

Reads date values in the form yymmdd or yyyyymmdd.

Syntax

**YYMMDDw.**

Syntax Description

-w specifies the width of the input field.

- Default 6
- Range 6–32

Details

SAS read date values in one of these forms:

- yymmdd
- yyyyymmdd

**yy or yyyy**

- is a two-digit or four-digit integer that represents the year.

**mm**

- is an integer between 01 and 12 that represents the month of the year.

**dd**

- is an integer between 01 and 31 that represents the day of the month.

You can separate the year, month, and day values by blanks or special characters. However, if delimiters are used, place them between all the values. You can also place blanks before and after the date. Make sure the width of the input field allows space for blanks and special characters.

**Note:** SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.
Example

data test;
  date='2018/05/04';
  sasdate=input(date,yyymmd10.);
  put sasdate;
  put sasdate date9.;
run;

SAS writes the following output to the log:

21308
04MAY2018

YYMMNw. Informat

Reads date values in the form yyyyymm or yymm.

Categories: CAS
- Date and Time
Syntax

**YYMMNw.**

Syntax Description

w specifies the width of the input field.

Default 6

Range 4–32

Details

SAS reads date values in one of these forms:

- **yyyymm**
- **ymmm**
- **yy** or **yyyy**
  - is a two-digit or four-digit integer that represents the year.

**mm**
  - is a two-digit integer that represents the month.

The N in the informat name must be used and indicates that you cannot separate the year and month values by blanks or special characters. SAS automatically adds a day value of 01 to the value to make a valid SAS date variable.

---

**Note:** SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

---

Example

```sas
data test;
  date='201805';
  sasdate=input(date,yyymm6.);
  put sasdate;
  put sasdate date9.;
run;
```

SAS writes the following output to the log:

```
21305
01MAY2018
```

See Also

**Formats:**

- "DATEw. Format" on page 160
- "DDMMYYw. Format" on page 166
- "YYMMDDw. Format" on page 449
YYQw. Informat

Reads quarters of the year in the form yyQq or yyyyQq.

Categories: CAS
Date and Time

Syntax

YYQw.

Syntax Description

w

specifies the width of the input field.

Default 6 (For SAS version 6, the default is 4.)

Range 4–32 (For SAS version 6, the range is 4–6.)

Details

SAS reads data in one of these forms:

- yyQq
- yyyyQq
yy or yyyy
is an integer that represents the two-digit or four-digit year.

q
is an integer (1, 2, 3, or 4) that represents the quarter of the year. You can also represent the quarter as 01, 02, 03, or 04.

The letter Q must separate the year value and the quarter value. The year value, the letter Q, and the quarter value cannot be separated by blanks. A value that is read with YYQw. produces a SAS date value that corresponds to the first day of the specified quarter.

Note: SAS interprets a two-digit year as part of the 100-year span that is defined by the YEARCUTOFF= system option.

Example

data test;
  date='2018Q2';
  sasdate=input(date,yyq6.);
  put sasdate;
  put sasdate date9.;
run;

SAS writes the following output to the log:

21275
01APR2018

ZDw.d Informat

Reads zoned decimal data.

Categories: CAS
          Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument. SAS issues a warning and uses formatted input to read the data.

See: “ZD Informat: UNIX” in SAS Companion for UNIX Environments
Syntax

ZDw.d

Syntax Description

w
specifies the width of the input field.

Default 1
Range 1–32

d
specifies the power of 10 by which to divide the value. This argument is optional.

Range 1–31

Details

The ZDw.d informat reads zoned decimal data in which every digit requires 1 byte and in which the last byte contains the value’s sign along with the last digit.

Note: Different operating environments store zoned decimal values in different ways. However, ZDw.d reads zoned decimal values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

You can enter positive values in zoned decimal format from a personal computer. Some keying devices enable you to enter negative values by overstriking the last digit with a minus sign.

Comparisons

- Like the w.d informat, the ZDw.d informat reads data in which every digit requires 1 byte. Use ZDVw.d or ZDw.d to read zoned decimal data in which the last byte contains the last digit and the sign.
- The ZDw.d informat functions like the ZDVw.d informat, with one exception: ZDVw.d validates the input string and disallows invalid data.
- The following table compares the zoned decimal informat with notation in several programming languages:

<table>
<thead>
<tr>
<th>Language</th>
<th>Zoned Decimal Notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAS</td>
<td>ZD3.</td>
</tr>
<tr>
<td>PL/I</td>
<td>PICTURE'99T'</td>
</tr>
</tbody>
</table>
ZDBw.d Informat

Reads zoned decimal data in which zeros have been left blank.

Categories: CAS
            Numeric

Interaction: List input is incompatible with binary input when this informat is specified in an
            INFORMAT= statement or an ATTRIB= statement that uses the INFORMAT= argument.
            SAS issues a warning and uses formatted input to read the data.

See: “ZDBw.d Informat: z/OS” in SAS Companion for z/OS

Syntax

ZDB \( ^w.d \)

Syntax Description

\( w \)

specifies the width of the input field.

Default 1

Range 1–32
The `ZDBw.d` informat reads zoned decimal data that is produced in IBM 1410, 1401, and 1620 form, where 0s are left blank rather than being punched.

### Example

```sas
data _null_;  
a=input('123{', zdb4.);  
put a=;  
run;
```

SAS writes the following to the log:

```
a=1230
```

---

**ZDVw.d Informat**

**Reads and validates zoned decimal data.**

**Categories:** CAS, Numeric

**Restriction:** This option does not perform validation on z/OS.

**Interaction:** List input is incompatible with binary input when this informat is specified in an `INFORMAT=` statement or an `ATTRIB=` statement that uses the `INFORMAT=` argument. SAS issues a warning and uses formatted input to read the data.

**Syntax**

`ZDVw.d`

**Syntax Description**

`w`

- Specifies the width of the input field.
  
  **Default:** 1
  
  **Range:** 1–32
    
  `d`

  - Specifies the power of 10 by which to divide the value. This argument is optional.
    
    **Range:** 1–31
Details

The ZDVw.d informat reads data in which every digit requires 1 byte and in which the last byte contains the value’s sign along with the last digit. It also validates the input string and disallows invalid data.

ZDVw.d is dependent on the operating environment. For example, on IBM mainframes, the ZDVw.d informat requires an F for all high-order nibbles except the last. (In contrast, the ZDw.d informat ignores the high-order nibbles for all bytes except for the nibbles that are associated with the sign.) The last high-order nibble accepts values that range from A–F, where A, C, E, and F are positive values and B and D are negative values. The low-order nibble on IBM mainframes must be a numeric digit that ranges from 0–9, as with ZD.

Note: Different operating environments store zoned decimal values in different ways. However, the ZDVw.d informat reads zoned decimal values with consistent results if the values are created in the same type of operating environment that you use to run SAS.

Comparisons

The ZDVw.d informat functions like the ZDw.d informat, with one exception: ZDVw.d validates the input string and disallows invalid data.

Example

data _null_;  
a=input('123{', zdv4.);  
b=input('123}', zdv4.);  
put a= b=;  
run;

SAS write the following to the log:

```
a=1230 b=-1230
```
