*What's New in SAS 9.4 National Language Support* ........................................ vii

## PART 1  NLS Concepts  1

**Chapter 1 / National Language Support (NLS)** ........................................ 3

- Overview to National Language Support ........................................ 3
- Definition of Localization and Internationalization ..................... 4

**Chapter 2 / Locale for NLS** ....................................................... 5

- Overview of Locale Concepts for NLS ......................................... 5
- Specifying a Locale .............................................................. 6

**Chapter 3 / Encoding for NLS** ..................................................... 9

- Overview: Encoding for NLS .................................................. 9
- Difference between Encoding and Transcoding .............................. 10
- Common Encoding Methods .................................................. 10
- Standards Organizations for NLS Encodings ............................... 14
- Code Point Discrepancies among EBCDIC Encodings .................... 14
- Collating Sequence ............................................................ 15
- Determining the Encoding of a SAS Data Set ............................... 19
- Default SAS Session Encoding ............................................ 20
- Setting the Encoding of a SAS Session .................................. 21
- Encoding Behavior in a SAS Session ..................................... 23
- Migrating Data to UTF-8 ..................................................... 24
- Migrating Data from WLATIN1 to UTF-8 ................................ 25

**Chapter 4 / Transcoding for NLS** .................................................. 31

- Overview of Transcoding ..................................................... 31
- Common Reasons for Transcoding ....................................... 32
- Transcoding and Translation Tables ..................................... 32
- SAS Options That Transcode SAS Data .................................... 34
- Transcoding Considerations ................................................ 34
- Compatible and Incompatible Encodings ................................ 35
- Avoiding Character Data Truncation By Using the CVP Engine .... 41
- Avoiding Character Truncation Using the %COPY_TO_NEW_ENCODING Macro ................................. 42

**Chapter 5 / Double-Byte Character Sets (DBCS)** .......................... 45

- Overview to Double-Byte Character Sets (DBCS) ......................... 45
- East Asian Languages ...................................................... 46
- Specifying DBCS .............................................................. 46
- Requirements for Displaying DBCS Character Sets ....................... 46
- When You Can Use DBCS Features ....................................... 47
- DBCS and SAS on a Mainframe ........................................... 47
SAS Data Conversion between DBCS Encodings ........................................ 48
Avoiding Problems with Split DBCS Character Strings .......................... 48

Chapter 6 / Time Zones ........................................................................ 51
  Overview of SAS Time Zones .............................................................. 51
  Specifying Time Zones in SAS ............................................................ 51

PART 2  Autocall Macros for NLS  61

Chapter 7 / Dictionary of Autocall Macros for NLS ............................... 63
  Autocall Macro Entries by Category .................................................... 63
  Dictionary .......................................................................................... 64

PART 3  Data Set Options for NLS  67

Chapter 8 / Dictionary of Data Set Options for NLS ............................... 69
  Data Set Options by Category ............................................................. 69
  Dictionary .......................................................................................... 69

PART 4  Formats for NLS  75

Chapter 9 / Overview to NLS Formats .................................................. 77
  International Date and Datetime Formats ............................................ 77
  Currency Representation ................................................................... 78
  Exceptions for Date and Time Default Widths ................................... 85

Chapter 10 / Dictionary of Formats for NLS ......................................... 89
  Categories of NLS Formats ................................................................. 93
  Dictionary .......................................................................................... 115

PART 5  Functions for NLS  339

Chapter 11 / Internationalization Compatibility for SAS String Functions . 341
  Internationalization Compatibility for SAS String Functions ............. 341

Chapter 12 / VARCHAR Support in Functions ........................................ 369
  VARCHAR Data Type in String Functions ........................................... 369

Chapter 13 / Dictionary of Functions for NLS ..................................... 373
  Functions by Category ....................................................................... 374
  Dictionary .......................................................................................... 380
PART 6  Informats for NLS  515

Chapter 14 / Dictionary of Informats for NLS  517
  Informats by Category  519
  Dictionary  533

PART 7  Macro Functions for NLS  665

Chapter 15 / Dictionary of Macro Functions for NLS  667
  Macro Functions by Category  667
  Dictionary  668

PART 8  System Options for NLS  679

Chapter 16 / Dictionary of System Options for NLS  681
  System Option Entries by Category  681
  Dictionary  683

PART 9  Options for Commands, Statements, and Procedures for NLS  717

Chapter 17 / Dictionary of Command, Statement, and Procedure Option for NLS  719
  Commands, Statements, and Procedures for NLS by Category  719
  Dictionary  720

PART 10  Procedures for NLS  755

Chapter 18 / DBCSTAB Procedure  757
  Overview: DBCSTAB Procedure  757
  Syntax: DBCSTAB Procedure  757
  Examples: DBCSTAB Procedure  759

Chapter 19 / LOCALEDATA Procedure  765
  Overview: LOCALEDATA Procedure  765
  Syntax: LOCALEDATA Procedure  765
  Examples: LOCALEDATA Procedure  774

Chapter 20 / TRANTAB Procedure  781
  Overview: TRANTAB Procedure  781
  Concepts: TRANTAB Procedure  782
  Syntax: TRANTAB Procedure  785
What's New in SAS 9.4 National Language Support

Overview

This release expands the scope and capabilities of SAS National Language Support (NLS). NLS is a set of features that enables a software product to function properly in every global market for which the product is targeted. SAS contains NLS features to ensure that you can write SAS applications that conform to local language conventions. Typically, software that is written in the English language works well for users who speak English and for data that is formatted using the conventions that are observed in the United States. However, without NLS, these products might not work as well for users in other regions of the world. SAS NLS enables users in regions such as Asia and Europe to process data successfully in their native languages and environments.

General Enhancements

The following enhancements are implemented for SAS 9.4 National Language Support:

- "Exceptions for Date and Time Default Widths" on page 85 provides exceptions to default widths. Some format widths exceed the default width, depending on the locale and encoding.
- The SAS name and POSIX name, Serbian_Yugoslavia sr_YU, has been removed from the document.
- “Specifying Time Zones in SAS” on page 51 explains SAS time zones.
- Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951 lists time zone IDs and time zone names.

SAS 9.4M2 has the following new chapter. Time zone information was taken from the overview and added to this chapter.

- Chapter 6, “Time Zones,” on page 51

SAS 9.4M4, has the following changes:

- Chapter 4, “Transcoding for NLS” is enhanced to reflect compatible encodings and troubleshooting tips to process encodings that are not compatible.
A new appendix, "Encodings and Their Aliases and Encoding Character Set Compatibility" on page 941 is added.

In SAS 9.4M5, information about avoiding character truncation using a SAS macro has been added. See "Avoiding Character Truncation Using the %COPY_TO_NEW_ENCODING Macro" on page 42 and "%COPY_TO_NEW_ENCODING Macro Function" on page 989.

In SAS 9.4M5, with the addition of "%COPY_TO_NEW_ENCODING Macro Function" on page 989, the restriction that the encoding of the data set must be the same as the session encoding is lifted.

### Additional Encodings

The following encodings are new:

- **LATIN7**
  - Baltic Rim
- **LATIN10**
  - South-Eastern European

### Locales

The following locales were added:

- **English_Malta** (en_MT)
- **Greek_Cyprus** (el_CY)
- **Irish_Ireland** (ga_IE)

For more information, see the **LOCALE=** table on page 809.

In SAS 9.4M3, the ManxGaelic_UnitedKingdom (gv_GB) locale was deprecated.

SAS 9.4M3 has the following new locales:

- **Kazakh_Kazakhstan** (kk_KZ)
- **Basque_Spain** (eu_ES)

In SAS 9.4M5, the Tagalog-Philippines locale was added.

In SAS Viya 3.5, aliases and POSIX numbers were updated for these locales. See the **LOCALE=** table on page 809.

- **Chinese_China**
- **Chinese_HongKong**
- **Chinese_Macau**
- **Chinese_Singapore**
- **Chinese_Taiwan**
The following formats are new:

**B8601DX**
Converts UTC datetime values into user local time and writes local time (SAS datetime values) with time zone offsets.

**B8601LX**
Writes SAS datetime values with time zone offsets.

**B8601TX**
Converts UTC time into user local time and writes local time values with time zone offsets.

**E8601DX**
Converts UTC datetime values into user local time and writes local time (SAS datetime values) with time zone offsets.

**E8601LX**
Writes SAS datetime values with time zone offsets.

**E8601TX**
Converts UTC time into user local time and writes local time values with time zone offsets.

**NLDATEL**
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date in the form month, date, year.

**NLDATEM**
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date.

**NLDATEMDL**
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month.

**NLDATEMDM**
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month.

**NLDatemDS**
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month.

**NLDATES**
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date string.

**NLDATEYML**
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and year.
NLDATEYMM
Converts a SAS date value to the date string of the specified locale and then writes the date values as the month and year with abbreviations.

NLDATEYMS
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date and year.

NLDATEYQL
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year and the year’s quarter value (Q1–Q4) using abbreviations.

NLDATEYQM
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year and the year’s quarter value (Q1–Q4) using abbreviations.

NLDATEYQS
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year and the year’s quarter value (1–4) with numbers and delimiters.

NLDATML
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date in the form month, date, year, and time.

NLDATMM
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date and time with abbreviations for the month and time.

NLDATMMDL
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month.

NLDATMYQS
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year and the year’s quarter value using numbers and delimiters.

NLDATMMDM
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month using abbreviations.

NLDATMMDS
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and day of the month using numbers and delimiters.

NLDATMS
Converts a SAS date value to the date string of the specified locale and then writes the date value as a date in the form MM/DD/YYYY.

NLDATMYML
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and the year.

NLDATMYMM
Converts a SAS date value to the date string of the specified locale and then writes the date value as the month and the year.
NLDATMYQL
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year’s quarter value (1–4) and the year.

NLDATMYQM
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year’s quarter value (1–4) and the year.

NLDATMYQS
Converts a SAS date value to the date string of the specified locale and then writes the date value as the year and the quarter (1-4) using numbers and delimiters.

NLDATMYMS
Converts a SAS date value to the date string of the specified locale and then writes the month and year with numbers and delimiters.

SAS 9.4M2 has the following new format:

BESTDOTX
Specifies that SAS choose the best notation and use a dot as a decimal separator.

In SAS 9.4M2, the country Latvia was added to the following formats:

NLMNIEUR
Writes the monetary format of the international expression for Belgium, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, and Spain.

NLMNLEUR
Writes the monetary format of the local expression for Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, and Spain.

In SAS 9.4M3 the following formats were modified:

NLDATEYM
Includes a note and example explaining how to use PROC LOCALEDATA to process data with a width of 6.

NLMNIEUR
Writes the monetary format of the international expression for Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia, and Spain.

NLMNLEUR
Writes the monetary format of the local expression for Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia, and Spain.

In SAS 9.4M5, the following format is new:

DTWEEKV
Writes a week and datetime number in decimal format by using the V algorithm.

In SAS Viya 3.5, these formats are new:

NLTIMEL
Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a long-uniform pattern.
NLTIMEM
Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a medium-uniform pattern.

NLTIMES
Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a short-uniform pattern.

In SAS Viya 3.5, documentation for these formats are added:

JNENGO
Writes SAS date values as Japanese dates as reign, year, month, and day.

JNENGT
Writes SAS datetime values as Japanese datetimes as reign, year, month, day, hour, and minute, and with narrow characters for numbers.

JNENGTW
Writes SAS datetime values as Japanese datetimes as reign, year, month, day, hour, and minute, and with wide characters for numbers.

JNENGOW
Writes SAS date values as Japanese dates as reign, year, month, and day, and with wide character for numbers.

Functions

The following functions are new:

BASECHAR
Converts characters to base characters.

KSTRIP
Removes leading and trailing blanks from a character string.

SETLOCALE
Specifies the locale keys for the current SAS locale.

TZONEID
Returns the current time zone ID.

TZONENAME
Returns the current standard (or daylight saving time) time zone name.

TZONES2U
Converts a SAS datetime value to a UTC datetime value.

TZONEU2S
Converts a UTC datetime value to a SAS datetime value.

An example was added in the following functions:

“KCOMPARE Function” on page 401
“KCOMPRESS Function” on page 403
“KCOUNT Function” on page 405
“KINDEX Function” on page 423
“KINDEXC Function” on page 426
In SAS 9.4M1, the following function is new:

**ANORM420**
- Returns a normalized string from an input string encoded in EBCDIC420.

**SAS 9.4M2** has the following new functions:

**KUPDATES**
- Inserts, deletes, and replaces character value contents.

**TZONEDSTNAME**
- Returns a daylight saving time name.

**TZONEDSTOFF**
- Returns the time zone offset value for the specified daylight saving time.

**TZONESTTNAME**
- Returns a standard time zone name.

**TZONESTTOFF**
- Returns the time zone offset value for the specified standard time.

In SAS 9.4M2, the following functions were updated:

**KCVT**
- DBCS, SBCS, and MBCS information was added and references to DBCSLANG and DBCSTYPE were removed.

**KUPDATE**
- The NLSCOMPATMODE option was removed from the function.

**SAS 9.4M3** has the following new functions:

**KINDEXB**
- Searches a character expression for a string of characters.

**KINDEXCB**
- Searches a character expression for specified characters.
KVERIFYB
Returns the position of the first character that is unique to an expression.

In SAS 9.4M3 the I18N level changed for the following functions:

ANORM420
   I18NL1

BASECHAR
   I18NL2

GETLOCENV
   I18NL2

GETPXLANGUAGE
   I18NL2

GETPXLOCALE
   I18NL2

GETPXREGION
   I18NL2

KCOMPARE
   I18NL2

KCOMPRESS
   I18NL2

KCOUNT
   I18NL2

KCVT
   I18NL1

KINDEX
   I18NL2

KINDEXC
   I18NL2

KLEFT
   I18NL2

KLENGTH
   I18NL2

KLOWCASE
   I18NL2

KPROPCASE
   I18NL2

KPROPCHAR
   I18NL2

KPROPDATA
   I18NL2

KREVERSE
   I18NL2

KRIGHT
   I18NL2

KSCAN
   I18NL2
KSTRCAT
I18NL2
KSTRIP
I18NL2
KSUBSTR
I18NL2
KSUBSTRB
I18NL2
KTRANSLATE
I18NL2
KTRIM
I18NL2
KTRUNCATE
I18NL2
KUPCASE
I18NL2
KUPDATE
I18NL2
KUPDATEB
I18NL2
KUPDATES
I18NL2
KVERIFY
I18NL2
NLDATE
I18NL2
NLATM
I18NL2
NLTIME
I18NL2
SASMSG
I18NL2
SASMSGL
I18NL2
SETLOCALE
I18NL2
SORTKEY
I18NL2
TZONEDSTOFF
I18NL2
TZONEDSTNAME
I18NL2
TRANTAB
I18NL2
In **SAS 9.4M3**, SAS supports the Unicode supplementary character sets with a Unicode session. The following functions were updated:

- “UNICODE Function” on page 504
- “UNICODEC Function” on page 506
- “UNICODEWIDTH Function” on page 508

In **SAS 9.4M4**, the short description and details section for the following functions changed *letter to single-width English alphabet*.

- “KLOWCASE Function” on page 431
- “KUPCASE Function” on page 460

**SAS 9.4M5** has the following new CALL routine:

```sas
CALL KSCANX
    Returns the position and length of the n
```n

**SAS 9.4M5** has the following new functions:

- **KCHARLIST**
  Returns the character list according to the modifier.

- **KCOUNTC**
  Counts individual characters in a character string.

- **KCOUNTW**
  Counts the number of words in a character string.

- **KCOUNTX**
  Counts the number of times that a specified substring appears within a character string.
KFIND
  Searches for a specific substring of characters within a character string.

KFINDC
  Searches a string for any character in a list of characters.

KFINDW
  Returns the character position of a word in a string or the number of the word in
  a string.

KSCANX
  Selects a specified word from a character expression.

KSUBSTRN
  Returns a substring, allowing a result with a length of 0.

**SAS 9.4M5** has the following updated functions:

KLEFT
  The Unicode Spaces That Are Removed by KLEFT, KRIGHT, and KTRIM table
  is new.

KSTRIP
  Information about data normalization has been added.

**SAS 9.4M6** has the following updated function:

KCOMPRESS
  The modifier(s) argument is added.

In **SAS Viya 3.5**, these functions were updated:

KCOMPARE
  Modifiers were added.

KPROPDATA
  The PUNC argument was added.

---

**Informats**

In **SAS 9.4M2**, the country Latvia was added to the following informats:

NLMNIEUR
  Reads the monetary format of the international expression for Austria, Belgium,Finland, France, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Malta, theNetherlands, Portugal, Slovenia, and Spain.

NLMNLEUR
  Reads the monetary format of the local expression for Austria, Belgium, Finland,France, Germany, Greece, Ireland, Italy, Latvia, Luxembourg, Malta, theNetherlands, Portugal, Slovenia, and Spain.

**SAS 9.4M2** has the following new informats:

NLDATEW
  Reads the date value in the specified locale and then converts the date value tothe local SAS date and the day of the week.
NLDATMW
Reads the date value in the specified locale and then converts the date value to
the local SAS day of the week and the datetime.

NLDATMAP
Reads the date value in the specified locale and then converts the date value to
the local SAS datetime with either a.m. or p.m.

In **SAS 9.4M2** aliases were added to the following informats:

NLDAT
Reads the date value in the specified locale and then converts the date value to
the local SAS date value.

NLTIM
Reads the time value in the specified locale and then converts the time value to
the local SAS time value.

NLDATM
Reads the datetime value of the specified locale and then converts the datetime
value to the local SAS datetime value.

In **SAS 9.4M3**, the following informats were updated:

NLMNIEUR
Reads the monetary format of the international expression for Austria, Belgium,
Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Latvia,
Lithuania, Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia,
and Spain.

NLMNLEUR
Reads the monetary format of the local expression for Austria, Belgium, Cyprus,
Estonia, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania,
Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia, and Spain.

**SAS 9.4M5** has the following new informat:

NLSTRMON
Reads the month name in the specified locale and converts it to a numeric value.

In **SAS Viya 3.5**, documentation is added for this informat:

JNENGO
Reads Japanese kanji date values in the form *ymmd*.

---

**Macro Functions**

In **SAS 9.4M5**, the following macro function is new:

VALIDCHS
Validates the character(s) encoding compatibility for data set variables.
Procedures

The following procedure is new:

LOCALEDATA
   Enables you to customize locale data.

Statement Options

In SAS 9.4M5, the following option is new:

CVPFORMATWIDTH
   Extends the width of the format.

In SAS Viya 3.5, these options are new:

CVPEXCLUDE
   Specifies the variables that are excluded during data processing.

CVPINCLUDE
   Specifies the variables that are included during data processing.

System Options

The following system options are new:

LSWLANG
   Specifies the language for the language switching feature when the
   LOGLANGCHG or ODSLANGCHG system option is set at SAS invocation.

LOGLANGENG
   Specifies using the English language for SAS log message text when the
   LOCALE option is set after start-up.

MAPEBCDIC2ASCII=
   Specifies a translation table that is used by SAS users to transcode from
   EBCDIC to ASCII and from ASCII to EBCDIC.

ODSLANGCHG
   Specifies whether the language of the text of the ODS output can be changed.

LOCALEDATA
   Specifies the source database for the locale information.

TIMEZONE
   Specifies the user local time zone.

SAS 9.4M2 has the following new system option:
NLDECSEPARATOR
Specifies whether SAS produces locale-sensitive numeric output for the decimal separator or continues to format numbers with U.S. English preferences.

The following system option was enhanced:

DFLANG
Supports the locale option.

In **SAS 9.4M2**, the NLSCOMPATMODE system option was removed.

In **SAS 9.4M3**, the LINGUISTIC option was added to the SORTSEQ= system option on page 706.
Overview to National Language Support

National Language Support is a set of features that enable a software product to function properly in every global market for which the product is targeted. SAS contains NLS features to ensure that SAS applications can be written so that they conform to local language conventions. Typically, software that is written in the English language works well for users who speak the English language and use data that is formatted using the conventions that are observed in the United States. However, without NLS, these products might not work well for users in other regions of the world. NLS in SAS enables users in regions such as Asia and Europe to process data successfully in their native languages and environments.

NLS is applied to data that is moved between machines; for example, NLS ensures that the data is converted to the correct format for use on the target machine.

Text-string operations are sensitive to SAS settings for language and region. This action enables correct results for such operations as uppercase and lowercase characters, classifying characters, and scanning data. SAS provides features to ensure that national characters, which are characters specific to a particular nation or group of nations, are displayed and are printed properly.

Software applications that incorporate NLS can avoid dependencies on language-specific or cultural-specific conventions for software features. Here are some examples:

- string manipulation
- character classifications
- character comparison rules
- code sets
- date and time formatting
- user interfaces
- message-text languages
- numeric and monetary formatting
- sort orders
Definition of Localization and Internationalization

*Internationalization* is the process of designing a software product without making assumptions that are based on a single language or locale, thereby facilitating localization. Internationalization ensures that international conventions (including rules for sorting strings and for formatting dates, times, numbers, and currencies) are supported. It also facilitates a consistent user experience across different language editions of a product. The abbreviation for internationalization is I18N.

Although the application logic might support cultural conventions (for example, the monetary and numeric formats of a particular region), only a localized version of the software presents user interfaces and system messages in the local language.

*Localization* is the process of adapting a product to meet the language, cultural, and other requirements of a specific target environment or market so that users can see results created in their own languages and conventions when using the product. Translation of the user interface, system messages, and documentation is part of localization.

SAS NLS features are available for localizing and internationalizing your SAS applications. For more information see “Internationalization Compatibility for SAS String Functions” on page 341.
Overview of Locale Concepts for NLS

A locale reflects the language, local conventions such as data formatting, and culture for a geographical region. Local conventions might include specific formatting rules for dates, times, and numbers and a currency symbol for the country or region. Collating sequence, paper size, postal addresses, and telephone numbers can also be included in locale.

Dates have many representations, depending on the conventions that are accepted in a culture. The month might be represented as a number or as a name. The name might be fully spelled or abbreviated. The order of the month, day, and year might differ according to locale.

For example, “the third day of October in the year 2016” would be displayed in a different way for each of these locales:

- Germany: 03.10.16
- Italy: 3/10/16
- United States: 10/03/16

Language is part of a locale, but is not unique to any one locale. For example, Portuguese is spoken in Brazil as well as in Portugal, but the cultures are different. In Brazil and in Portugal, there are similarities in the formatting of data. Numbers are formatted using a comma (,) to separate integers from fractional values and a dot (.) to separate groups of digits to the left of the radix character. However, there are important differences, such as the currency symbols that are used in the two different locales. Portugal uses the Euro and requires the Euro symbol € while Brazil uses the Real that is represented by the two-character currency symbol R$.

Also, a country might have more than one official language. Canada has two official languages: English and French; two values can be specified for the LOCALE= system option: English_Canada and French_Canada.
Numbers, including currency, can have different representations. For example, the decimal separator, or radix character, is a dot (.) in some regions and a comma (,) in other regions. The thousands separator can be a dot, comma, or even a space in some regions. Monetary conventions likewise vary between locales; for example, a dollar sign or a yen sign might be attached to a monetary value.

Paper size and measurement are also locale considerations. Standard paper sizes include letter (8-1/2-by-11-inch paper) and A4 (210-by-297-millimeter paper). The letter paper size is mainly used by some English-speaking countries; A4 is used by most other locales. Most locales use centimeters, some locales use inches.

Time can be represented in one English-speaking country or region by using the 12-hour notation. Other English speakers expect time values to be formatted using the 24-hour notation.

Specifying a Locale

How Locale Is Specified at SAS Invocation

You can use the LOCALE= system option to specify the locale of the SAS session at SAS invocation. LOCALE= also implicitly sets the following SAS system options:

- DATESTYLE=
- DFLANG=
- ENCODING=
- LOCALEDATA
- MAPEBCDICTOASCII
- ODSLANGCHG
- PAPERSIZE=
- RSASIOTRANSERROR
- TIMEZONE
- URLENCODING

Note: Locale can also be specified using POSIX naming standards. For example, en_US is the POSIX equivalent for the SAS value English_UnitedStates.

Default values for the LOCALE= option are the same under each operating environment. For more information, see “LOCALE= Values for PAPERSIZE and DFLANG, Options” on page 809.

The English_UnitedStates value for LOCALE= causes the following options to be implicitly set to the specified Windows default values SAS invocation:

- DATESTYLE=MDY
- DFLANG=English
- ENCODING=WLATIN1
At invocation, an explicitly set system option overrides any implicitly set option.

At invocation, the explicit setting PAPERSIZE=A4 overrides an implicit setting of the PAPERSIZE= option using the LOCALE= option. For more information, see “PAGESIZE= System Option” in SAS System Options: Reference.

How Locale Is Specified during a SAS Session

You can use the LOCALE= system option to specify the locale of the SAS session during the SAS session. However, only the values for these system options change implicitly to reflect the changed value of LOCALE=:

- DFLANG=
- PAPERSIZE=

Note: The PAPERSIZE option is affected only if it is set to LOCALE. For more information see “PAGESIZE= System Option” in SAS System Options: Reference.

The value for the ENCODING= system option does not change implicitly to reflect the changed value of LOCALE=.

The Italian_Italy value that is assigned to the LOCALE= option implicitly resets the following options during the SAS session to reflect the changed value of the LOCALE= system option:

- DFLANG=Italian
- PAPERSIZE=A4

Language Switching

SAS messages are displayed in the language that is specified by the settings in the SAS configuration file during start up. You can view SAS messages in another language by using the language switching feature. You can access the language switching feature with the ODSLANGCHG system option. If ODSLANGCHG is enabled, then the value of the LOCALE system option determines the language for procedure output, user interface elements, and ODS fonts. If ODSLANGCHG is disabled, then messages appear in the language that is set during start up. This feature is supported on any server as long as the characters of the messages are supported by the encoding. For more information, see the “ODSLANGCHG System Option” on page 704. The LSWLANG system option specifies the language for the language switching feature when the LOGLANGCHG or ODSLANGCHG system option is set at SAS invocation. The LSWLANG system option has higher priority over the LOCALE system option. If the LSWLANG option is set to a valid SAS language, the SAS log output is controlled by its value. Otherwise, the LOCALE= option determines the language of the SAS log.

The LOGLANGCHG system option controls whether language switching occurs for the SAS log messages. This option controls the language of message switching in SAS log output. If LOGLANGCHG is specified, the language of the SAS log
depends on the LSWLANG or LOCALE= option. For more information, see “LOGLANGCHG System Option” on page 698.

The LSWLANG option specifies the language of messages if LOGLANGCHG or ODSLANGCHG are enabled. If LSWLANG is set to LOCALE, the LOCALE= option determines the language for switching. LSWLANG=LOCALE is the default. For more information, see “LSWLANG System Option” on page 701.

The LOGLANGENG option is a toggle option that overrides LOGLANGCHG and LSWLANG and sets them to LOGLANGCHG=ON and LSWLANG=EN. As a result, the LOG output is in English, and the NL format output does not change. This option changes the setting of ODSLANGCHG. If ODSLANGCHG=OFF, the system message language for ODS output is determined by SAS configuration. If ODSLANGCHG=ON, all messages are in English because of the LSWLANG setting. For more information, see “LOGLANGENG System Option” on page 699.

For more information about Language Switching, see Multilingual Computing with SAS® 9.4.
Overview: Encoding for NLS

An encoding maps each character in a character set to a unique numeric representation, which results in a table of all code points. This table is referred to as a code page, which is an ordered set of characters in which a numeric index (code point value) is associated with each character. The position of a character on the code page determines its two-digit hexadecimal number.

A character set is the set of characters and symbols that are used by a language or group of languages. A character set includes national characters (which are characters specific to a particular nation or group of nations), special characters
An encoding method is a set of rules that assign the numeric representations to the set of characters. These rules govern the size of the encoding (number of bits used to store the numeric representation of the character) and the ranges in the code page where characters appear. The encoding methods result from the adherence to standards that have been developed in the computing industry. An encoding method is often specific to the computer hardware vendor.

An encoding results from applying an encoding method to a character set.

An individual character can occupy a different position in a code page, depending on the code page used. An example is the euro symbol, €. The Unicode code point for the euro symbol is U+20AC.

Each SAS session is set to a default encoding, which can be specified by using various SAS language elements.

### Difference between Encoding and Transcoding

Encoding establishes the default working environment for your SAS session. For example, the Windows LATIN1 encoding is the default encoding for a SAS session under Windows in a Western European locale such as the de_DE locale for German in Germany. For example, the Windows LATIN1 code point for the uppercase letter Ä is C4 hexadecimal.

Note: The default encoding varies according to the operating environment and the locale.

However, if you are working in an international environment (for example, you access SAS data that is encoded in German EBCDIC), the German EBCDIC code point for the uppercase letter Ä is 4A hexadecimal. In order for a version of SAS that normally uses Windows LATIN1 to properly interpret a data set that is encoded in German EBCDIC, the data must be transcoded. Transcoding is the process of converting data from one encoding to another. When SAS transcodes the Windows LATIN1 uppercase letter Ä to the German EBCDIC uppercase letter Å, the hexadecimal representation for the character is converted from the value C4 to a 4A. For conceptual information, see Chapter 4, "Transcoding for NLS," on page 31.

### Common Encoding Methods

An encoding results from applying an encoding method to a coded character set.

An encoding method is the application of established industry rules to a coded character set to produce an encoded character scheme. Such rules prescribe the number of bits required for storing the numeric representation of a specific character and its code position in the encoding. ISO 2022 and UTF-8 are examples of
encoding methods. For more information, see “Standards Organizations for NLS Encodings” on page 14.

An encoding method is a set of rules that assign numeric representations to a set of characters. These rules govern the size of the encoding, the number of bits used to store the numeric representation of the characters, and the ranges in the encoding where characters appear.

Common encoding methods are listed here:

Unicode

Unicode is a common and popular character set.

provides up to 110,116 character combinations. Unicode can accommodate basically all of the world's languages. Unicode is a coded character set. The following are encodings of the Unicode character set:

UTF-8

is an MBCS encoding that contains the Latin-script languages, Greek, Cyrillic, Arabic, and Hebrew. It also includes East Asian languages such as Japanese, Chinese, and Korean. The characters in UTF-8 are of varying width, from 1 to 4 bytes. UTF-8 maintains ASCII compatibility by preserving the ASCII characters in code positions 1 through 128.

UTF-8 is the most common encoding. Storing text as a UTF-8 encoding might take more space than storing it in legacy encodings. The expansion amount depends on the language and text. Here are some possible expansions for some common legacy encodings:

<table>

Footnote: Adapted from W3C Internationalization (I18n) Activity

UTF-16

is a 16-bit form that contains all of the most common characters in all modern writing systems. Most of the characters are uniformly represented with 2 bytes, although there is extended space, called surrogate space, for additional characters that require 4 bytes.
UTF-32
is a 32-bit form whose characters each occupy 4 bytes.

ASCII (American Standard Code for Information Interchange)
is a 7-bit encoding for the United States that provides 128 character combinations. The encoding contains characters for uppercase and lowercase English, American English punctuation, base 10 numbers, and a few control characters. This set of 128 characters is common to most other encodings. ASCII is used by personal and UNIX computers.

EBCDIC (Extended Binary Coded Decimal Interchange Code) family
is an 8-bit encoding that provides 256 character combinations. There are multiple EBCDIC-based encodings. EBCDIC is used on IBM mainframes and most IBM mid-range computers. EBCDIC follows ISO 646 conventions to facilitate translations between EBCDIC encodings and 7-bit (and 8-bit) ASCII-based encodings. The 95 EBCDIC graphical characters include 82 invariant characters (including a blank space), which occupy the same code positions across most EBCDIC single-byte code pages. It also includes 13 variant graphic characters, which occupy varying code positions across most EBCDIC single-byte code pages. For more information about variant characters, see “Code Point Discrepancies among EBCDIC Encodings” on page 14.

There are also multi-byte character set (MBCS) EBCDIC encodings.

ISO (International Organization for Standardization) 646 family
is a 7-bit encoding that is an international standard and provides 128 character combinations. The ISO 646 family of encodings is similar to ASCII except that it has 12 code points for national variants. The 12 national variants represent specific characters that are needed for a particular language.

ISO 8859 family and Windows family
is an 8-bit extension of ASCII that supports all of the ASCII code points and adds 12 more, providing 256 character combinations. LATIN1, which is officially named ISO-8859-1, is the most frequently used member of the ISO 8859 family of encodings. In addition to the ASCII characters, LATIN1 contains accented characters, other letters needed for languages of Western Europe, and some special characters. HTTP and HTML protocols are based on Unicode.

Other encodings
The ISO 8859 family has other members that are designed for other languages. The following table describes the other encodings that are approved by ISO.

<table>
<thead>
<tr>
<th>ISO Standard</th>

</tr>
</tbody>
</table>

There are other encodings in the standards for EBCDIC and Windows that support different languages and locales.
See “Encodings and Their Aliases and Encoding Character Set Compatibility” on page 941 for common encodings and their aliases.

Standards Organizations for NLS Encodings

Encodings that are supported by SAS are defined by the following standards organizations:

International Organization for Standardization (ISO)
- promotes the development of standardization and related activities. ISO also establishes standards for encodings.

American National Standards Institute (ANSI)
- coordinates voluntary standards and conformity to those standards in the United States. ANSI works with ISO to establish global standards.

Unicode Consortium
- that develops and promotes the Unicode standard, which provides a unique number for every character.

Code Point Discrepancies among EBCDIC Encodings

The following characters are considered variant because they can have different code positions in various EBCDIC variations: ! # $ @ \ [ ] ^ `{ } ~ These characters exist in every encoding, but their hexadecimal values might change from one encoding to another, as shown in the following table.

Table 3.4 Variant Characters

</tr>
</tbody>
</table>
Examples of characters that are commonly used in programming languages are { and $.

These characters are known as variant characters. For example, if a German mainframe user entered an ä, which occupies code point C0, an American compiler would interpret code point C0 as a {.

### Collating Sequence

#### Overview of Collating Sequence

The **collating sequence** is the order in which characters are sorted. For example, when the SORT procedure is executed, the collating sequence determines the sort order (higher, lower, or equal to) of a particular character in relation to other characters.

The default collating sequence is binary collation, which sorts characters according to each character’s location in the code page of the session encoding. (The session encoding is the default encoding for a SAS session. The default encoding can be specified by using various SAS language elements.) The sort order corresponds directly to the arrangement of the code points within the code page.

Binary collation is the fastest type of collation because it is the most efficient for the computer. However, locating characters within a binary-collated report might be difficult if you are not familiar with this method. For example, a binary-collated report lists words beginning with uppercase characters separately from words beginning with lowercase characters. It lists words beginning with accented characters after words beginning with unaccented characters. Therefore, for ASCII-based encodings, the capital letter Z precedes the lowercase letter a. Similarly, for EBCDIC-based encodings, the lowercase letter z precedes the capital letter A.

You can request an alternate collating sequence that overrides the binary collation. To request an alternate collating sequence, specify one of the following sequences:

- a translation table name
This example illustrates the results of using different collating sequences to sort a short list of words:

<table>
<thead>
<tr>
<th>Binary</th>
<th>Translation Table</th>
<th>Encoding Value</th>
<th>Linguistic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aaron</td>
<td>aardvark</td>
<td>Aaron</td>
<td>aardvark</td>
</tr>
<tr>
<td>Aztec</td>
<td>azimuth</td>
<td>Aztec</td>
<td>Aaron</td>
</tr>
<tr>
<td>Zeus</td>
<td>Aaron</td>
<td>Zeus</td>
<td>azimuth</td>
</tr>
<tr>
<td>aardvark</td>
<td>Aztec</td>
<td>aardvark</td>
<td>Aztec</td>
</tr>
<tr>
<td>azimuth</td>
<td>cote</td>
<td>azimuth</td>
<td>cote</td>
</tr>
<tr>
<td>cote</td>
<td>coté</td>
<td>cote</td>
<td>côte</td>
</tr>
<tr>
<td>coté</td>
<td>côte</td>
<td>coté</td>
<td>côte</td>
</tr>
<tr>
<td>côte</td>
<td>côte</td>
<td>côte</td>
<td>côte</td>
</tr>
<tr>
<td>côte</td>
<td>côte</td>
<td>côte</td>
<td>côte</td>
</tr>
<tr>
<td>côte</td>
<td>zebra</td>
<td>côte</td>
<td>zebra</td>
</tr>
<tr>
<td>zebra</td>
<td>zèbre</td>
<td>zebra</td>
<td>zèbre</td>
</tr>
<tr>
<td>zèbre</td>
<td>Zeus</td>
<td>zèbre</td>
<td>Zeus</td>
</tr>
</tbody>
</table>

The first column shows the results of binary collation on characters that are represented in an ASCII-based encoding. The alphabetization is not consistent because of the separate grouping of words that begin with uppercase and lowercase characters. For example, the word Zeus appears before aardvark because of the code points that are assigned to the characters within the ASCII-based encoding.

The second column shows the results of specifying a translation table that alternates the ordering of lowercase and uppercase characters. If you use the translation table, the word aardvark appears before Zeus. However, the word azimuth appears before Aaron because the translation table assigns a weight value to the lowercase character a that is less than the weight value of the uppercase character A. In addition, accents are sorted from left to right. For example, coté comes before côte.

The third column shows the results of specifying the ASCII-based, double-byte latin1 encoding.

The last column shows the results of linguistic collation for the session locale fr_FR (French_France), which uses a collation algorithm to alphabetize words. The algorithm specifies that words beginning with lowercase characters appear before
words beginning with uppercase characters. In addition, this linguistic collation sorts accents from right to left because of the French locale specification.

SAS has adopted the International Components for Unicode (ICU) to implement linguistic collation. The ICU and its implementation of the Unicode Collation Algorithm (UCA) have become a standard. The collating sequence is the default provided by the ICU for the specified locale.

Request Alternate Collating Sequence

To request an alternate collating sequence, use the following SAS language elements:

- `SORTSEQ=` option in the PROC SORT statement. See “Collating Sequence Option Statement” on page 721.
- `SORTSEQ=` system option. See “SORTSEQ= System Option: UNIX, Windows, and z/OS” on page 706.

Note that neither method supports all of the collating sequences. For example, only the `SORTSEQ=` option in the PROC SORT statement supports linguistic collation. However, both the `SORTSEQ=` option in the PROC SORT statement and the `SORTSEQ=` system option support translation table collating sequences.

The BASE (V9) engine and the REMOTE engine for SAS/SHARE support all alternate collating sequences. The V9TAPE sequential engine supports the use of a translation table and an encoding value to sort data, but the V9TAPE engine does not support linguistic collation.

Specifying a Translation Table

A translation table is a SAS catalog entry that transcodes data from one single-byte encoding to another single-byte encoding. A translation table also reorders characters when sorting them. A translation table can be one that SAS provides, such as a standard collating sequence like ASCII, EBCDIC, or DANISH; or it can be a user-defined translation table.

When you specify a translation table for an alternate collating sequence, the characters are reordered by mapping the code point of each character to an integer weight value in the range of 0 to 255. A binary collation is then performed.

For collating purposes, you can create translation tables that order characters so that lowercase and uppercase characters alternate. For example, you can create a translation table to correct the situation in which Z precedes a in an ASCII-based encoding. (However, regardless of the weight assignments in the translation table, it is difficult to achieve a true alphabetic ordering that takes the character case into account.) You can also create a translation table that orders alphabetic characters of a particular language in their expected order.

The TRANTAB procedure creates, edits, and displays translation tables. For example, you can display a translation table to view the character-weight values. The translation tables that are supplied by SAS are stored in the SASHELP.HOST catalog. Any translation table that you create or customize is stored in your SASUSER.PROFILE catalog. Translation tables have an entry type of TRANTAB.

You can specify a translation table with the SORTSEQ= option in the PROC SORT statement or with the SORTSEQ= system option. For example, if your operating environment sorts with the ASCII-based WLatin1 encoding by default, and you want to sort with a translation table that alternates uppercase and lowercase characters, issue the following statements to specify the SAS translation table FRSOLAT1:

```sas
proc sort data=myfiles.test sortseq=FRSOLAT1;
   by name;
run;
```

A SAS data set that is sorted with a translation table contains a sort indicator that displays the specified translation table name as the collating sequence in CONTENTS procedure output.

### Specifying an Encoding Value

An **encoding** is a set of characters (letters, logograms, digits, punctuation marks, symbols, and control characters) that have been mapped to hexadecimal values, called code points, that computers use. When you specify an encoding value for an alternate collating sequence, the characters are transcoded from the SAS session encoding to the specified encoding. Then a binary collation is performed. You can specify all encoding values that are supported by the ENCODING= option, including multi-byte encodings. Note that specifying a translation table can transcode data, but translation tables are limited to single-byte encodings.

You can specify an encoding value with the SORTSEQ= option in the PROC SORT statement, but you cannot specify an encoding value in the SORTSEQ= system option. For example, you want to sort a SAS data set and then transport it to a Japanese Windows environment. If your session encoding is ASCII-based and binary collation is in effect, you can issue the following statements to specify the ASCII-based double-byte encoding SHIFT-JIS:

```sas
proc sort data=myfiles.test sortseq='shift-jis';
   by name;
run;
```

Note that SAS checks the encoding value for any translation tables with the same name. If a translation table name exists, SAS uses the translation table.

A SAS data set that is sorted with an encoding value contains a sort indicator that displays the specified encoding value as the collating sequence in CONTENTS procedure output.

### Specifying Linguistic Collation

**Linguistic collation** sorts characters according to rules of language and produces results that are intuitive and culturally acceptable. The results are similar to the collation used in printed materials such as dictionaries, phone books, and book indexes. Linguistic collation is useful for generating reports or other data presentations and for achieving compatibility between systems.
SAS incorporates the International Components for Unicode (ICU). ICU is an open-source library that provides routines for linguistic collation that are compatible with the Unicode Collation Algorithm (UCA). The UCA is a standard by which Unicode strings can be compared and ordered.

To request linguistic collation, you must use the SORTSEQ= option in the PROC SORT statement because the SORTSEQ= system option does not support linguistic collation. For example, the following statements cause the SORT procedure to collate linguistically, in accordance with the French_France locale:

```plaintext
options locale=fr_FR;
proc sort data=myfiles.test sortseq=linguistic;
   by name;
run;
```

When linguistic collation is requested, SAS uses the default linguistic collation algorithm that is provided by the ICU for the SAS session locale. This algorithm reflects the language, local conventions such as data formatting, and culture for a geographical region. You can modify the algorithm by specifying options in parentheses following the LINGUISTIC keyword. For example, you can specify a different locale; you can specify the CASE_FIRST= option to collate lowercase characters before uppercase characters, or vice versa; and so on. Generally, it is not necessary to specify options, because the ICU associates defaults with the various languages and locales. For more information about the linguistic options, see the SORTSEQ= option in “Collating Sequence Option Statement” on page 721 or the SORTSEQ= option in the PROC SORT statement in Base SAS Procedures Guide.

A SAS data set that is sorted linguistically contains a sort indicator that displays the collating sequence LINGUISTIC in CONTENTS procedure output. Along with the sort indicator, the data set also records a complete description of the linguistic collating sequence in the file’s descriptor information. The descriptor information is also displayed in CONTENTS procedure output.

---

**Determining the Encoding of a SAS Data Set**

**Using PROC CONTENTS to Display the Encoding of a SAS Data Set**

You can display the encoding of a data set by using PROC CONTENTS:

```plaintext
proc contents data=sashelp.class; run;
```

Here is the output from the PROC CONTENTS code. The encoding is US–ASCII.
Default SAS Session Encoding

The ENCODING= system option is used to specify the SAS session encoding. The session encoding establishes the environment to process SAS syntax and SAS data sets, and to read and write external files. If neither the LOCALE= nor ENCODING= options is set, a default value is set.

The ENCODING system option is set explicitly in all SASFoundation sasv9.cfg configuration files.

The BI server configuration process uses the default SASFoundation sasv9.cfg file (!SASROOT/sasv9.cfg). The default sasv9.cfg file points to the sasv9.cfg that contains the LOCALE and ENCODING option that you select. This action usually happens during deployment. You can deploy multiple server contexts at the site that uses different SAS configurations.

<table>

For a complete list of supported encoding values for a SAS session, see Chapter 24, “Encoding Values for a SAS Session,” on page 839.
Setting the Encoding of a SAS Session

You can set the session encoding by using the ENCODING= system option, the DBCS options, or the LOCALE= system option.

Note: Values for the ENCODING= system option depend on the operating environment.

The priority order for setting the encoding is as follows:

1. ENCODING= system option
   
   The SAS session encoding is determined by the ENCODING= option regardless of whether the DBCS or LOCALE= options are specified. If the ENCODING= option is specified, a set of valid DBCS options is set regardless of whether the user has specified those options. Also, if the ENCODING= option is specified, the LOCALE= option is set to an appropriate value unless a value has been specified by the user.

   Note: If the ENCODING= option is specified, the TRANTAB= option is implicitly set. TRANTAB= options apply only to external files.

2. DBCS options
   
   Most North and South American, European, Middle Eastern, African, and Australian users use the SAS SBCS environment and do not use the DBCS environment.

   If the ENCODING= option is not specified, the SAS session encoding is determined by the DBCS options regardless of whether the LOCALE= option is specified. The LOCALE= option is set to an appropriate value unless a value has been specified by the user.

   The encoding is determined by the values of the DBCSLANG and DBCSTYPE options for DBCS languages, such as Japanese, Korean, Simplified Chinese, and Traditional Chinese.

   The DBCS options are valid only when the DBCS extension directory is included in the path option list. The path of the DBCS extension dynamic link library (DLLs) must be located at the top of the pathname list of the path option for the DBCS languages when you want to invoke a DBCS SAS session. The DBCS extension DLLs are located in the directory `!SASROOT/dbcs/sasexe` by default.

   Also, you might have to specify the resourcesloc, msg, and sashelp options to use localized resources even if the SAS session encoding is not a DBCS language (for example, Polish, German, and French). The localized resources are located under `!SASROOT/nls/<language identifier>/<sasmsg, sashelp, sasmacro, resource>`. The values for language identifiers are: cs, de, en, es, fr, hu, it, ja, ko, pl, ru, sv, zh, and zt.
You can specify a sasv9.cfg file located in the localized directories such as !SASROOT/nls/<language identifier> so that you do not have to consider using the path, resourcesloc, sasmsg, and sashelp options.

If DBCS (which specifies that SAS process DBCS encodings) is specified, DBCSLANG= and DBCSTYPE= options are implicitly set. The default values for DBCSTYPE= and DBCSLANG= match those values for the DBCS environment on the host (for example, Japanese, Korean, or Chinese).

3. **LOCALE= system option**

The SAS session encoding is determined by the LOCALE= option and the platform, if the ENCODING= or DBCS options are not specified.

The following example shows that encoding is explicitly set by default for the Spanish_Spain locale:

```bash
sas9 -locale Spanish_Spain
```

The WLATIN1 encoding is the default encoding for the Spanish_Spain locale.

The following example shows that the WLATIN2 encoding is set explicitly when SAS is invoked:

```bash
sas9 -encoding wlatin2
```

**Note:** Setting DBCS encodings, DBCS options, or a CJK (Chinese, Japanese, Korean) locale on SAS if the DBCS extensions are not available fails to successfully invoke SAS.

**Note:** Changing the encoding for a SAS session does not affect SAS keywords or SAS log output, which remain in English.

In Table 3.7 on page 22, the following values for the CJK locales are based on locale and platform:

Encoding Behavior in a SAS Session

Encoding Support for Data Sets by SAS Release

For Base SAS files, there are three categories of encoding support. Encoding support is based on the version of SAS that created the file:

- Data sets that are created in SAS 9 automatically have an encoding attribute, which is specified in the descriptor portion of the file. In SAS 9, DBCS by default recognizes the DBCSTYPE value and converts it to the encoding value and specifies it in the descriptor portion of the field.

- Data sets that are created in SAS 7 and SAS 8 do not have an encoding value that is specified in the file. It is assumed that SAS 7 and SAS 8 data sets were created in the SAS session encoding of the operating environment. However, the descriptor portion of the file does support an encoding value. When you replace or update a SAS 7 or SAS 8 file in a SAS 9 session, SAS specifies the current session encoding in the descriptor portion of the file, by default. In SAS 8, DBCS has the DBCSTYPE field, instead of the encoding field.

- Data sets created in SAS 6 do not have an encoding value that is associated with the file. An encoding value cannot be specified in the file.

Output Processing

When you create a data set in SAS 9, encoding is determined as follows:

- If a new output file is created, the data is written to the file using the current session encoding.

- If a new output file is created using the OUTREP= option, the data is written to the file using the default session encoding for the operating system that is specified by the OUTREP= value. The OUTREP= option specifies a data representation that is different from the current session. For more information, see “OUTREP= Data Set Option” on page 72.

- If a new output file replaces an existing file, the new file inherits the encoding of the existing file. For output processing that replaces an existing file that is from another operating environment or if the existing file has no encoding that is specified in it, then the current session encoding is used.
Input Processing

For input (read) processing in SAS 9, encoding behavior is as follows:

- Most users choose the default behavior that does not specify an encoding for the input file.

- If the session encoding and the encoding that is specified in the file are incompatible, the data is transcoded to the session encoding. For example, if the current session encoding is ASCII and the encoding that is specified in the file is EBCDIC, SAS transcodes the data from EBCDIC to ASCII.

- If a file does not contain a specified encoding, SAS transcodes the data only if the file's data representation is different from the session encoding.

Reading and Writing External Files

SAS reads and writes external files using the current session encoding. SAS assumes that the external file has the same encoding as the session encoding. For example, if you are creating a new SAS data set by reading an external file, SAS assumes that the encoding of the external file and the current session are the same. If the encodings are not the same, the external data could be written incorrectly to the new SAS data set. You need to specify an appropriate ENCODING option. The following example specifies the Shift-JIS encoding:

```sas
filename in 'external-file'
  encoding='Shift-JIS';
data mylib.contacts;
infile in;
  length name $ 30 first $ 30 street $ 60 zip $ 10 city $ 30;
  input name first street zip city;
run;
```

For details about the syntax for the SAS statements that perform input and output processing, see “SAS Options That Transcode SAS Data” on page 34.

Migrating Data to UTF-8

UTF-8 is part of the Unicode coded character set. UTF-8 is the preferred and most-used encoding, and it is the recommended encoding for using Unicode with operating systems like Linux.

You can migrate your data from SAS using other encodings to SAS using UTF-8 encoding in order to support multilingual data and to support SAS Viya. There are several methods of migrating data: Cross-environment data access (CEDA), Character Variable Padding (CVP) engine, and the %COPY_TO_NEW_ENCODING macro. Instructions on how to use these methods are described in Migrating Data to UTF-8 for SAS Viya.
Migrating Data from WLATIN1 to UTF-8

The common encodings for Western European character data are ISO 8859-1 (LATIN1) and Windows cp1252 (WLATIN1). If your character data is encoded as LATIN1 or WLATIN1, there are several factors that you must consider when you migrate to UTF-8. This section focuses on WLATIN1 characters, which are a superset of LATIN1 characters.

All WLATIN1 characters are available in UTF-8. Here is an example of the WLATIN1 code page:

![WLATIN1 Code Page](image-url)
Characters in WLATIN1 require 1 byte, and UTF-8 characters require 1–4 bytes. In Figure 3.2, the characters in the highlighted rows 2–7 require 1 byte in UTF-8. These characters are also referred to as ASCII characters.

Figure 3.2 Rows 2–7 in the WLATIN1 Code Page

In Figure 3.3, the characters in the highlighted rows 8–F require 1 byte in WLATIN1 and 2–3 bytes in UTF-8.
For errors or incorrect data that result from migrating characters that are 1 byte in \textsc{wlatin1} but 2–4 bytes in UTF-8, follow these recommendations to resolve the problem:

**Truncation**

All \textsc{wlatin1} characters can be transcoded to UTF-8. A transcoding error or warning means that the character variable is not long enough to hold the UTF-8 representation of those characters. To resolve the problem, you can expand the size of your character columns using \texttt{CVP}.

**Unexpected characters**

If you are expecting all characters in your \textsc{wlatin1} data to be 1 byte in UTF-8, you might be surprised to see a transcoding error when you migrate your data to UTF-8. The \textsc{wlatin1} encoding includes two versions of some punctuation characters:

- ASCII version in rows 2–7
Some text editors, such as Microsoft Word, support an AutoFormat feature that converts the ASCII characters that are entered from the keyboard to a version of the character that is produced by a typographical device.

For example, the quotation mark character (”) (also known as a straight quotation mark) has a hexadecimal representation of 22 in both WLATIN1 and UTF-8. However, AutoFormat might convert the character to left and right double quotation characters (also referred to as curly quotation marks or smart quotation marks). The hexadecimal values for the left and right double quotation marks in WLATIN1 are 93 and 94. But, in UTF-8, these characters are E2809C and E2809D, and each character requires 3 bytes.

You can use the KPROPDATA function with the PUNC option to convert smart quotation marks and other typographical punctuation characters to a 1-byte character in UTF-8.

Here are the punctuation characters that are 1 byte in WLATIN1 and 2–4 bytes in UTF-8:

1 Three ASCII period characters.
Overview of Transcoding

Transcoding is the process of converting data from one encoding to another. Transcoding is necessary when the SAS session encoding and the encoding of the data are different. Transcoding is often necessary when you move data between operating environments that use different locales and encoding.

The sort order corresponds directly to the arrangement of the code points within the code page.

For example, consider a file that was created under a Linux operating environment that uses the LATIN1 encoding, then moved to an IBM mainframe that uses the German EBCDIC encoding. When the file is processed on the IBM mainframe, the data is remapped from the LATIN1 encoding to the German EBCDIC encoding. If the data contains an uppercase letter Ä, the hexadecimal number is converted from C4 to 4A.

Transcoding does not translate between languages; transcoding remaps characters.

To dynamically transcode data between operating environments that use different encodings, an explicit encoding value must be specified. For details, see Chapter 23, “Encoding Values in SAS Language Elements,” on page 827.
Common Reasons for Transcoding

Some situations where data might commonly be transcoded are:

- sharing data between two different SAS sessions that are running in different locales or in different operating environments
- reading an external file and the file’s encoding is incompatible with the session encoding

Transcoding and Translation Tables

Translation tables are implicitly set by the LOCALE= system option. They are used only for transcoding external files. There is direct transcoding for SAS files between the session encodings.

Specifying LOCALE= or ENCODING= indirectly sets the appropriate translation table values in the TRANTAB= option. Translation tables are used for transcoding one SBCS encoding to another and back again. For example, there is a specific translation table that maps Windows LATIN2 to ISO LATIN2. Translation tables apply only to external files.

The following figure shows a translation table. The area of a translation table for mapping from Windows LATIN2 (wlt2) to ISO LATIN2 (lat2) is named "table 1," and the area for mapping characters from ISO LATIN2 to Windows LATIN2 is named "table 2."
Figure 4.1  SAS Windows LATIN 2 to ISO LATIN 2 Translation Table

The LOCALSE= or ENCODING= system option and other encoding options (statements, commands, or procedures) eliminate the need to directly create or manage translation tables.

**CAUTION**

Do not change a translation table unless you are familiar with its purpose.

Translation tables are used internally by the SAS supervisor to implement NLS. If you are unfamiliar with the purpose of translation tables, do not change the specifications without proper technical advice.

The TRANTAB= option specifies the translation table to be used in the SAS session. For details, see "TRANTAB= System Option" on page 709. The TRANTAB procedure is used to create, edit, and display customized translation tables. For details, see Chapter 20, "TRANTAB Procedure," on page 781.
SAS Options That Transcode SAS Data

The following SAS options for various language elements enable you to transcode, or to override the default encoding behavior. These elements enable you to specify a different encoding for a SAS file or a SAS application or to suppress transcoding.

For a list of supported encoding values to use for these options, see "SBCS, DBCS, and Unicode Encoding Values for Transcoding Data" on page 827.

Transcoding Considerations

Although transcoding usually occurs with no problems, there are situations that can affect your data and produce unsatisfactory results. Here are several examples:

- One encoding can conflict with another. That is, two encodings can use different code points for the same character, or use the same code points for two different characters.
Characters in one encoding might not be present in another encoding. For example, a specific encoding might not have a character for the dollar sign ($). Transcoding the data to an encoding that does not support the dollar sign would result in the character not printing or displaying.

The number of bytes for a character in one encoding can be different from the number of bytes for the same character in another encoding. An example is transcoding from a double-byte character set (DBCS) to a single-byte character set (SBCS). Therefore, transcoding can result in character value truncation.

If an error occurs during transcoding so that the data cannot be transcoded back to its original encoding, data can be lost. That is, if you open a data set for update processing, the observation might not be updated. However, if you open the data set for input (read) processing and no output data set is open, SAS issues a warning that can be printed. Processing proceeds and allows a PRINT procedure or other Read operation to show the data that does not transcode.

CEDA has some processing limitations. For example, CEDA does not support update processing. See “SAS File Processing with CEDA” in SAS Language Reference: Concepts.

Incorrect encoding can be stamped on a SAS 7 or SAS 8 data set if it is copied or replaced in a SAS 9 session with a different session encoding from the data. The incorrect encoding stamp can be corrected with the CORRECTENCODING= option in the MODIFY statement in PROC DATASETS. If a character variable contains binary data, transcoding might corrupt the data.

Data set and variable labels have a maximum of 256 bytes and variable names have a maximum of 32 characters. If a data set contains long labels with international characters, the transcoded labels might exceed the maximum, resulting in a transcoding error. You can shorten the long labels in the original data set to resolve the transcoding issue.

Compatible and Incompatible Encodings

Overview of Compatible and Incompatible Encodings

An incompatible file is either a file that has a different data representation from the host architecture or an encoding value that differs from the SAS session encoding.

Table 4.2 on page 37 lists encodings that do not require CEDA processing for transcoding. For example, the first row is for the encoding method SBCS ASCII. If the session encoding is LATIN1, and the data set’s encoding is LATIN9, CEDA processing does not occur. Another example is the DBCS ASCII encoding method. Any combination of encodings in the first line of that row, SHIFT-JIS, MS-932, IBM-942, MACOS-1 does not invoke CEDA processing. If the session encoding is IBM-942, and the data set’s encoding is MACOS-1, CEDA processing does not occur.

In order to handle character data correctly, SAS requires that data be encoded using the session encoding. When SAS reads a data set that has a different encoding, CEDA compares the data set encoding with the SAS session encoding. The encodings might be incompatible, meaning that transcoding is required in order for SAS to safely handle the characters that are read from the data set.

ASCII is the foundation for many encodings, and it is used by most personal computers and workstations. However, the IBM mainframe uses an EBCDIC encoding. ASCII and EBCDIC machines, and the encodings that are used to store their data, are incompatible. Therefore, transcoding is required. For example, data must be transcoded if the SAS file is WLATIN1 and the session encoding is OPEN_ED-1047. Note that SAS CEDA processing is used only in a mainframe environment when the data sets reside in a hierarchical file system such as z/FS or USS. Encodings that support characters for different languages are also incompatible. For example, WLATIN1 is a single-byte (SBCS) encoding that supports characters for Western European languages. The WCYRILLIC is also SBCS, but it has Russian characters and does not have many of the Western European characters. Therefore, WLATIN1 and WCYRILLIC are incompatible.

You can disable CEDA transcoding. For example, if the data set encoding is not compatible with the session encoding, but you know that all of the characters in the data set are compatible, transcoding occurs even though it is not necessary. You might prefer to transcode the data using a function such as KPROPDATA or KCVT instead of CEDA transcoding the data. You can prevent CEDA from transcoding by specifying one of these encoding names in either the ENCODING= data set option, or in either the INENCODING= or OUTENCODING= option in the LIBNAME statement.

**CAUTION**
Misuse of these encoding values could result in data corruption. ASCIIANY prevents transcoding.

- **ANY** specifies that no transcoding is desired, even between EBCDIC and ASCII encodings.

  **Note:** ANY is a synonym for binary. Because the data is binary, the actual encoding is irrelevant.

- **ASCIIANY** enables you to create a data set that is compatible with all ASCII-based encodings. The encoding value that is set for the SAS data set using ASCIIANY is US-ASCII.

- **EBCDICANY** enables you to create a data set that is compatible with all EBCDIC-based encodings.

It is important for you to know the data in your data set before using one of these encodings to disable transcoding. For example, if the encoding of your data set is WLATIN1 and the session encoding is WLATIN2, CEDA transcodes the data because the encodings are not compatible. However, if you know that all of the characters in the data set are ASCII characters, specify ASCIIANY as the INENCODING option in the LIBNAME statement to prevent transcoding.

**Note:** If you are running SAS in a UTF-8 session encoding, any data set that is not UTF-8 or US-ASCII is incompatible.

```plaintext
libname myfiles 'path to data sets' inencoding=asciiany;
```
The encoding of the data set is not changed, but CEDA assumes that the data set encoding is the encoding that is specified in the LIBNAME statement.

As an alternative, you can prevent transcoding by changing the encoding in the data set header. To do so, use the CORRECTENCODING option in the PROC DATASETS MODIFY statement.

```
libname myfiles "path to data sets";
proc datasets library=myfiles;
   modify olddata / correctencoding=ASCIIANY;
quit;
```

You can use these functions to verify that encodings are compatible:

- The ENCODCOMPAT function verifies the transcoding compatibility between two encodings. For more information, see "ENCODCOMPAT Function" on page 392.
- The ENCODISVALID function specifies a valid encoding name. For more information, see "ENCODCOMPAT Function" on page 392.

For a list of the encodings, by operating environment, see Chapter 24, “Encoding Values for a SAS Session,” on page 839.

**Table 4.2 Encoding Combinations That Do Not Need CEDA Processing for Transcoding**

<table>
<thead>
<tr>
<th>Encoding Method</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>SBCS ASCII</td>
<td>LATIN1, LATIN9</td>
</tr>
<tr>
<td></td>
<td>LATIN1, WLATIN1</td>
</tr>
</tbody>
</table>

**TIP**  Transcoding is not performed in SAS using CEDA between these two encodings. WLATIN1 differs from LATIN1 by using displayable characters rather than control characters in the 80 to 9F (hexadecimal) range. These differences can lead to problems when cutting and pasting from MS WORD documents.

**Session Encodings and Data Set Encodings, Notes, Warnings, and Errors**

The encoding used to create a SAS data set is saved in the data set header. For example, if you create a data set when you are running SAS with a session encoding of WLATIN1, the WLATIN1 encoding is stored in the data set header. SAS expects the character data encoding to be the same as the encoding in your SAS session. When the encodings do not match, CEDA must be used to transcode the data.

If the data set encoding and session encoding do not match, and the message is a NOTE, the character data should be valid. For example, when a UTF-8 session reads a data set created with a WLATIN1 encoding, you will see the following note in your log:

```
NOTE: Data file MYLIB.CARS.DATA is in a format that is native to another host, or the file encoding does not match the session encoding. Cross Environment Data Access will be used, which might require additional CPU resources and might reduce performance.
```

If the data set encoding and the session encoding are not compatible, transcoding fails, and the message is a WARNING or an ERROR:
This error can mean there is not enough space in one or more character columns in the data set's observation buffer to convert the data to the session encoding or that the characters can't be represented in the session encoding.

If the data set contains characters that are not supported by the session encoding, the message means that characters were lost during transcoding. For example, if the session encoding is WLATIN1, which supports characters for Western European languages, and SAS reads a data set that is SHIFT-JIS and contains Japanese characters, the message in the SAS log means that the Japanese characters are lost during transcoding.

**Line-feed Characters and Transferring Data between EBCDIC and ASCII**

Software that runs under ASCII operating environments requires the end of the line be specified by the line-feed character. When data is transferred from z/OS to a machine that supports ASCII encodings, formatting problems can occur, particularly in HTML output, because the EBCDIC newline character is not recognized. SAS supports two sets of EBCDIC-based encodings for z/OS:

- The encodings that have EBCDIC in their names use the traditional mapping of EBCDIC line-feed to ASCII line-feed character, which can cause data to appear as one stream.
- The encodings that have Open Edition in their names use the line-feed character as the end-of-line character. When the data is transferred to an operating environment that uses ASCII, the EBCDIC newline character maps to an ASCII line-feed character. This mapping enables ASCII applications to interpret the end-of-line correctly, resulting in better formatting.

For a list of the encodings, by operating environment, see Chapter 24, "Encoding Values for a SAS Session," on page 839.

**EBCDIC and OpenEdition Encodings Are Compatible**

EBCDIC and OpenEdition are compatible encodings.

Encodings that contain EBCDIC in their names use the traditional mapping of EBCDIC line-feed (0x25) and newline (0x15) characters.

Encodings that contain OPEN_ED in their names and OpenEdition in their descriptions switch the mapping of the newline and line-feed characters. That is, they use the line-feed character as the end-of-line character.

If the two encodings use the same code page number but one is EBCDIC and the other is Open Edition, no transcoding is necessary.

Example:
If the data is encoded in EBCDIC1143 and the SAS session is encoded in OPEN_ED-1143, no transcoding is necessary because they use the same 1143 code page.

In order to transfer data between ASCII and EBCDIC, you can specify Open Edition encodings from the list of compatible encodings.

### Encoding Compatibility in the z/OS Environment

Different encodings affect SAS applications at different release levels in the z/OS environment. You can migrate your SAS applications so that they use NONLSCOMPATMODE. See Ensuring Compatibility of Encodings.

### Avoiding Character Data Truncation By Using the CVP Engine

If your data set encoding does not match the encoding of your SAS session, the character data in your data set might need more space in the new encoding. For example, if your SAS session is using a UTF-8 session encoding, and you are reading a data set with an encoding of Windows cp 1252 (WLATIN1), some of the characters that require one byte in WLATIN1 might require 2 or 3 bytes in UTF-8. To avoid data truncation, your character variables must expand to a width that is 1.5 times greater than the width of the original data.

When you process a SAS data file that requires transcoding, you can request that the CVP (character variable padding) engine expand character variable lengths so that character data truncation does not occur. (A variable's length is the number of bytes used to store each of the variable's values.)

Character data truncation can occur when the number of bytes for a character in one encoding is different from the number of bytes for the same character in another encoding, such as when a single-byte character set (SBCS) is transcoded to a double-byte character set (DBCS) or to a multi-byte character set (MBCS). An SBCS represents each character in one byte, and a DBCS represents each character in one or two bytes. An MBCS represents characters in a varying length from one to four bytes. For example, when transcoding from WLATIN1 to a Unicode encoding, such as UTF-8, the variable lengths (in bytes) might not be sufficient to hold the values, and the result is character data truncation.

Using the CVP engine, you specify an expansion amount so that variable lengths are expanded before transcoding, then the data is processed. Think of the CVP engine as an intermediate engine that is used to prepare the data for transcoding. After the lengths are increased, the primary engine, such as the default base engine, is used to do the actual file processing.

The CVP engine is a read-only engine for SAS data files only. You can request character variable expansion (for example, with the LIBNAME statement) in either of the following ways:

- explicitly specify the CVP engine and using the default expansion of 1.5 times the variable lengths.
implicitly specifying the CVP engine with the LIBNAME options CVPBYTES= or CVPMULTIPLIER=. These options specify the expansion amount. In addition, you can use the CVPENGINE= option to specify the primary engine to use for processing the SAS file; the default is the default SAS engine.

For example, the following LIBNAME statement explicitly assigns the CVP engine. Character variable lengths are increased using the default expansion, which multiples the lengths by 1.5. For example, a character variable with a length of 10 has a new length of 15, and a character variable with a length of 100 has a new length of 150:

```
libname expand cvp ' SAS data-library';
```

**Note:** The expansion amount must be large enough to accommodate any expansion. Otherwise, truncation still occurs. An error is written to the SAS log.

**Note:** For processing that conditionally selects a subset of observations by using a WHERE expression, using the CVP engine might affect performance. Processing the file without using the CVP engine might be faster than processing the file using the CVP engine. For example, if the data set has indexes, the indexes are not used in order to optimize the WHERE expression if you use the CVP engine.

**Note:** The “CASNCHARMULTIPLIER= System Option” in SAS Cloud Analytic Services: User’s Guide increases the number of bytes when transcoding to UTF-8 in the CAS server.

**Note:** CVP creates a READONLY copy of the data. If you want to save a permanent copy of the data, you need to create a new data set.

**Note:** Data set and variable labels have a maximum of 256 bytes and variable names have a maximum of 32 characters. If a data set contains long labels with international characters, the transcoded labels might exceed the maximum, resulting in a transcoding error. You can shorten the long labels in the original data set to resolve the transcoding issue.

For more information and examples, see “CVPBYTES=, CVPENGINE=, CVPFORMATWIDTH=, CVPMULTIPLIER=, CVPVARCHAR=, CVPEXCLUDE=, CVPINCLUDE= Statement” on page 729.

---

**Avoiding Character Truncation Using the %COPY_TO_NEW_ENCODING Macro**

If you write a CNTLOUT= data set using a different encoding than the session encoding, you might receive an error for truncating character variables. If this error occurs, write the CNTLOUT= data set using the current session encoding, and then...
use the `%COPY_TO_NEW_ENCODING` macro to create the CNTLOUT= data set with the new encoding.

Suppose that you are using a data set that contains monetary values in Euros. Your session encoding is WLATIN1, and you specify UTF-8 encoding for the CNTLOUT= data set. In WLATIN1, the Label variable is predetermined to be 5 bytes long, with a value of €1234 (in hexadecimal, '803132334'x). When you attempt to store the variable in the CNTLOUT= data set with UTF-8 encoding, the length of that string must be 7 bytes (in hexadecimal, 'E282AC31323334'x), so it truncates. You can use the `%COPY_TO_NEW_ENCODING` macro to prevent this error.

For more information about the `%COPY_TO_NEW_ENCODING` macro, see “%COPY_TO_NEW_ENCODING Macro Function” on page 989.
Overview to Double-Byte Character Sets (DBCS)

Because East Asian languages have thousands of characters, double (two) bytes of information are needed to represent most characters.

Each East Asian language usually has more than one DBCS encoding system, due to nonstandardization among computer manufacturers. SAS processes the DBCS encoding information that is unique to each manufacturer for the major East Asian languages.

With the proper software extensions, you can use SAS for the following functions:

- display any of the major East Asian languages in the DBCS version of the SAS System
- import data from East Asian language computers and move the data from one application or operating environment to another (which might require SAS ACCESS or other SAS products)
- convert standard East Asian date and time notation to SAS date values, SAS time values, and SAS datetime values
- create data sets and various types of output (such as reports and graphs) that contain East Asian language characters.
East Asian Languages

East Asian languages include:

- Chinese, which is written in Simplified Chinese script, and is used in the People's Republic of China and Singapore
- Chinese, which is written in Traditional Chinese script, and is used in Hong Kong Special Administrative Region of the People’s Republic of China (SAR), Macau SAR, and Taiwan
- Japanese
- Korean

Specifying DBCS

To specify DBCS, use the following SAS system options:

ENCODING
  recognizes default character-est encoding.

DBCS
  recognizes DBCS characters.

You can set the session encoding by using the ENCODING= system option, the DBCS options, or the LOCALE= system option. The ENCODING= system option has priority. For more information, see “Setting the Encoding of a SAS Session” on page 21. Please see the “ENCODING System Option: UNIX, Windows, and z/OS” on page 692 for more information.

Requirements for Displaying DBCS Character Sets

In order to display data sets that contain DBCS characters, you must have the following resources:

- system support for multiple code pages
- DBCS fonts that correspond to the language that you intend to use

If you need to create a user-defined character for use with SAS software, your computer must support DBCS. These computers have a limited availability in the U.S. and Europe. These East Asian language computer systems use various methods of creating the characters. In one popular method, the user enters the phonetic pronunciation of the character, often using Latin characters. The computer
presents a menu of characters whose sounds are similar to the phonetic pronunciation and prompts the user to select one of them.

When You Can Use DBCS Features

After you have set up your SAS session to recognize a specific DBCS language and operating environment, you can work with your specified language in these general areas:

- the DATA step and batch-oriented procedures
- windowing and interactive capabilities
- cross-system connectivity and compatibility
- access to databases
- graphics

In a DATA step and in batch-oriented procedures, you can use DBCS wherever a text string within quotation marks is allowed. Variable values, variable labels, and data set labels can all be in DBCS. DBCS can also be used as input data and with range and label specifications in the FORMAT procedure. In WHERE expression processing, you can search for embedded DBCS text.

DBCS and SAS on a Mainframe

Another type of DBCS encoding exists on mainframe systems, which combine DBCS support with the 3270-style data stream. Each DBCS character string is surrounded by escape codes called shift out/shift in, or SO/SI. These codes originated from the need for the old-style printers to shift out from the EBCDIC character set, to the DBCS character set. The major manufacturers have different encodings for SO/SI; some manufacturers pad DBCS code with one byte of shift code information while others pad the DBCS code with two bytes of shift code information. These differences can cause problems in reading DBCS information about mainframes.

PCs, minicomputers, and workstations do not have SO/SI but have their own types of DBCS encodings that differ from manufacturer to manufacturer. SAS has several formats and informats that can read DBCS on SO/SI systems:

Table 5.1 SAS Formats and Informats That Support DBCS on SO/SI Systems

<table>
<thead>

</tbody>
</table>
## SAS Data Conversion between DBCS Encodings

Normally, DBCS data that is generated on one computer system is incompatible with data generated on another computer system. SAS has features that allow conversion from one DBCS source to another, as shown in the following table.

### Table 5.2  DBCS Conversions

<table>
<thead>

## Avoiding Problems with Split DBCS Character Strings

- When working with DBCS characters, review your data to make sure that SAS recognizes the entire character string when data is imported or converted or used in a DATA step or a PROC step.
- On mainframe systems that use shift out/shift in escape codes, DBCS character strings can become truncated during conversion across operating environments.
- There is a possibility that DBCS character strings can be split when working with the PRINT, REPORT, TABULATE, and FREQ procedures. If undesirable splitting occurs, you might have to add spaces on either side of your DBCS character.
string to force the split to occur in a better place. The SPLIT= option can also be used with PROC REPORT and PROC PRINT to force string splitting in a better location.
Overview of SAS Time Zones

SAS must process local and international time and date values to accommodate international customers. This chapter explains time zones and how SAS processes the following:

- time zones
- Daylight Saving Time (DST)
- local time
- SAS datetime values

Specifying Time Zones in SAS

Definitions

Daylight Saving Time (DST)
Also referred to as Summer Time, Daylight Saving Time (DST) is a way of making better use of the daylight in the evenings by setting the clocks forward one hour during the longer days of summer and back again in the fall. DST begins in the northern hemisphere between March–April and ends between September–November. Standard time begins in the northern hemisphere between September–November and ends between March–April. DST begins in the southern hemisphere between September–November and ends between March–April. Standard time begins in the southern hemisphere between March–
April and ends between September–November. Many of the countries in the northern hemisphere observe DST. DST is not a standard for all countries.

Local time
Specify the local time when a time zone is not specified by the TIMEZONE= system option.

Time zone
An area of the earth’s surface in which an identical and standard time is used. It is usually referred to as the local time. Time zones have political and geographical boundaries and might be adjusted for the convenience of local populations. Some geographically large countries, such as India and China, use only one time zone, but other large countries, such as Russia and the United States, have more than one time zone.

Time zone ID
Specifies a region and area separated by a forward slash (/). Asia/Tokyo is a time zone ID. Time zone IDs are compatible with Java time zones. For a list of time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

Time zone name
Specifies three or four characters that indicate a time zone. For a list of time zone names, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

Time zone offset
Specifies the number of hours and minutes that a time zone is off from the Universal Coordinated Time (UTC) in the form +|-hh:mm or +|-hhmm.

User local time
Specify the local time for the time zone that is specified by the TIMEZONE= system option.

Universal Coordinated Time (UTC)
Specify the time at the zero meridian, near Greenwich, England. UTC is a datetime value that uses the ISO 8601 basic form yyyyymmddThhmmss+|-hhmm or the ISO 8601 extended form yyyy-mm-ddThh:mm:ss+|-hh:mm.

About Time Zones in SAS
SAS datetime values are measured in seconds, beginning with 01Jan1960 00:00:00 local time. For example, the SAS datetime value for 01Jan1960 00:00:00 in England is 0. In Japan, the SAS datetime value for 01Jan1960 00:00:00 is also 0. There is a nine-hour difference between England and Japan. At the same point in time, the datetime in England and the datetime in Japan cannot be 0. In order to work with absolute time and datetime values, SAS supports the UTC date, time, and datetime values in time zones.

You can name a time zone either by specifying a time zone ID or a time zone name. Time zone IDs name a region and an area in the form region/area. An example of a time zone ID is America/New_ York. A time zone name specifies the time zone. An example of a time zone name is EST for Eastern Standard Time. When a specific time zone changes the time for DST or summer time, a separate time zone name is available for that alternate time. PST is Pacific Standard Time. PDT is Pacific Daylight Time. EET is Eastern European Time. EEST is Eastern European Summer Time. When you specify a time zone ID, SAS determines the time using DST. You
do not need to determine whether the region/area uses alternate times. For a list of
time zone IDs and time zone names, see Appendix 3, “Time Zone IDs and Time
Zone Names,” on page 951.

When you specify a time zone, SAS shifts the datetime value according to the time
zone and stores the new value. The time-zone-specific timestamp is displayed to
the SAS log. The SAS timestamp constant enables you to specify a timestamp
using the ISO 8601 standard. Here is a timestamp using the SAS timestamp
constant:

tstamp='2013-05-17T09:15:30–05:00'dt;

When you specify a SAS timestamp constant, SAS converts the timestamp to a
local datetime value by using the current time zone and the time zone offset.

Time zone settings affect the TIME( ) function, the TODAY( ) function, the DATE( )
function, and the DATETIME( ) function. When a time zone is set, the date and
datetime values use the current time zone.

This example shows how the datetime values change according to the time zone.

options tz='America/New_York';  1
data NY;
  NY_DT=datetime();  2
  format NY_DT datetime20.;  3
run;
options tz='Asia/Shanghai';  4
data SH;
  SH_DT=datetime();  5
  format SH_DT datetime20.;  6
run;

options tz='America/New_York';  7
proc contents data = NY nodetails;  8
run;
options tz='Asia/Shanghai';  9
proc contents data = NY nodetails;  10
run;

These statements correspond to the lines that are numbered in the preceding DATA
and PROC steps.

1 Set the TZ option to America/New_York.
2 Assign the date and time to the variable NY_DT using the DATETIME function.
3 Modify the value of NY_DT using the DATETIME format.
4 Set the TZ option for the second DATA step to Asia/Shanghai.
5 Assign the date and time to the variable SH_DT using the DATETIME function.
6 Modify the value of SH_DT using the DATETIME format.
7 Set the TZ option for the first PROC CONTENTS step to America/New_York.
8 Display information for the data set NY. The TZ option is set to America/
   New_York.
9 Set the TZ option for the second PROC CONTENTS step to Asia/Shanghai.
10 Display information for the data set NY with the TZ option that is set to Asia/
    Shanghai. Notice the time zone shift in the Created and Last Modified rows. You
    are displaying information about the same data set but with different time zones.
These statements produce this output. The first output is from the data set using the America/New_York time zone. The second output is from the data set using the Asia/Shanghai time zone.

### Tasks and SAS Language Elements for Time Zone Processing

#### Set a Time Zone

To set a time zone, use the TIMEZONE= system option:

```sas
options timezone='asia/tokyo';
```

Use time zone names or time zone IDs for the value of the option. Enclose the value in quotation marks. For time zone names and time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951. For more information, see “TIMEZONE= System Option” on page 707.

#### Determine a Time Zone ID Offset

You use the TZONEOFF( ) function to determine a time zone name or time zone ID offset:

- The TZONEOFF( ) function returns the time zone offset for the current time zone.
- The TZONEOFF('time-zone-id') function returns the time zone offset for the 'time-zone-id'.

This program returns the time zone offset for the current time zone (EST) and for Tokyo. Here is the output in the SAS log:
data _null_;  
o1=tzoneoff();  
o2=tzoneoff('asia/tokyo');  
put o1 time.;  
put o2 time.;  
run;

-5:00:00  9:00:00

To find the difference between two time zones, you can use the ABS( ) function:

diff=abs(tzoneoff('america/new_york') - tzoneoff('asia/tokyo'));

For more information, see "TZONOFF Function" on page 496.

Determine a Time Zone ID or Time Zone Name

Use these functions to determine a time zone name or time zone ID:

- The TZONEID( ) function returns the current time zone ID.
- The TZONENAME( ) function returns the current time zone name based on a time zone ID and a SAS datetime value or based on a SAS datetime value only.

Here are some examples of using these functions. March 10 of 2013 is the first day of DST:

options timezone='America/Chicago';
data _null_;  
tzid=tzoneid();  
put 'Current time zone is ' tzid;  
tzn=tzonename('america/los_angeles');  
put 'Time zone for Los Angeles: ' tzn;  
tznST=tzonename('america/los_angeles','10mar2013:01:00:00'dt);  
put 'Time zone for Los Angeles standard time: ' tznST;  
tznDT=tzonename('america/los_angeles','10mar2013:02:00:00'dt);  
put 'Time zone for Los Angeles daylight time: ' tznDT;  
tznSDT=tzonename('10mar2013:02:00:00'dt);  
put 'Time zone name for this SAS datetime: ' tznSDT;  
run;

Here is the output:

Current time zone is AMERICA/CHICAGO
Time zone for Los Angeles: PST
Time zone for Los Angeles standard time: PST
Time zone for Los Angeles daylight time: PDT
Time zone name for this SAS datetime: CDT

For more information, see "TZONID Function" on page 493 and "TZONENAME Function" on page 494.

Convert Datetime Values between SAS and UTC

These functions convert SAS datetime values to UTC and UTC to SAS datetime values:

- The TZONES2U( ) converts a SAS datetime value to a UTC datetime value.
The **TZONEU2S**( ) function converts a UTC datetime value to a SAS datetime value.

Here are some examples of using these functions:

```sas
options timezone='est';
data _null_;  
   put ' The time zone is EST';
   diff=abs(tzoneoff('america/new_york') - tzoneoff('europe/london'));
   put ' New York-London difference:' diff time.;
   diff=abs(tzoneoff('america/new_york') - tzoneoff('asia/tokyo'));
   put ' New York-Tokyo difference:' diff time.;
   put ' The SAS datetime is 2013-03-15T09:15:00+00:00 ';
   put ' '; 
   put ' Change a SAS datetime to a UTC value ';
   put ' '; 
   put ' The time zone offset +00:00 is for London ';
   put ' Subtract the 5 hours for the EST time zone offset';
   stu1=tzones2u('2013-03-15T09:15:00+00:00'dt);
   put ' STU1 Using E8601DX:' stu1 e8601dx.;
   put ' '
   put ' 2013-03-15 9:15 AM in Tokyo is 2013-03-14 7:15 PM in New York';
   put ' Subtract the 5 hours for the EST time zone offset';
   stu2=tzones2u('2013-03-15T09:15:00+00:00'dt, 'Asia/Tokyo');
   put ' STU2 Using E8601DX:' stu2 e8601dx.;
   put ' '
   put ' Change a UTC to a SAS datetime value. '.'
   put ' '
   put ' +00:00 is the time zone offset for London. '
   put ' Subtract the 5 hours for the EST time zone offset';
   uts1=tzoneu2s('2013-03-15T09:15:00+00:00'dt);
   put ' UTS1 Using DATETIME:' uts1 datetime.;
   put ' '
   put ' 9:15:00+00:00 is 18:15:00 in Tokyo. '
   put ' Subtract the 5 hours for the EST time zone offset';
   uts2=tzoneu2s('2013-03-15T09:15:00+00:00'dt, 'Asia/Tokyo');
   put ' UTS2 Using DATETIME:' uts2 datetime.;
run;
```

Here is the output:
The time zone is EST
New York-London difference: 5:00:00
New York-Tokyo difference: 14:00:00
The SAS datetime is 2013-03-15T09:15:00+00:00

Change a SAS datetime to a UTC value

The time zone offset +00:00 is for London
Subtract the 5 hours for the EST time zone offset
STU1 Using B8601DX: 2013-03-15T04:15:00-05:00

2013-03-15 9:15 AM in Tokyo is 2013-03-14 7:15 PM in New York
Subtract the 5 hours for the EST time zone offset
STU2 Using B8601DX: 2013-03-14T14:15:00-05:00

Change a UTC to a SAS datetime value.

+00:00 is the time zone offset for London.
Subtract the 5 hours for the EST time zone offset
UTS1 Using DATETIME: 14MAR13:23:15:00

9:15:00+00:00 is 18:15:00 in Tokyo.
Subtract the 5 hours for the EST time zone offset
UTS2 Using DATETIME: 15MAR13:13:15:00

For more information, see "TZONES2U Function" on page 497.

Write ISO 8601 Time and Datetime Values Based on the Time Zone

These formats write ISO 8601 time and datetime values using basic and extended notation. The time, the UTC offset, or both are based on the value of the TIMEZONE= system option:

- The B8601TX. and E8601TX. formats convert a UTC time value to a user local time and write the time value with a time zone offset.
- The B8601DX. and E8601DX. formats convert a UTC datetime value to a user local time and write the datetime value with a time zone offset.
- The B8601LX. and E8601LX. formats write a local datetime value using the UTC offset for the user local time zone.

This program formats time and datetime values based on the time zone ID Australia/Sydney:

options timezone='Australia/Sydney';
data _null_;  
st='18:33:40't;  
sdt='2013-03-17T14:30:22+00:00'dt;  
put 'Time B8601TX:' st b8601tx.;  
put 'Time E8601TX:' st e8601tx.;  
put 'UTC B8601DX:' sdt b8601dx.;  
put 'UTC E8601DX:' sdt e8601dx.;  
put 'UTC B8601LX:' sdt b8601lx.;  
put 'UTC E8601LX:' sdt e8601lx.;  
run;

Here is the output:
Write SAS Datetime Values Using a Time Zone Offset

These formats write SAS datetime values using a UTC offset based on the value of the TIMEZONE= system option:

- The NLDATMTZ. format writes a SAS datetime value using the form
  
  `ddmmmyyyy:hh:mm:ss +|-hhmm`.

- The NLDATMZ. format writes a SAS time value using the form `hh:mm:ss +|-hhmm`.

- The NLDATMWZ. format writes a SAS datetime value as the day of the week, the month, the day, the year, and AM | PM in the form `day-of-week, month-name dd, yyyy AM|PM +hhmm`.

This program formats SAS time and datetime values using a time zone offset:

```sas
options timezone='Indian/Maldives';
data _null_;  
st='18:33:40't;  
sdt='2013-03-17T14:30:22+00:00'dt;  
put 'Time NLDATMTZ:' st nldatmtz.;  
put 'SAS datetime NLDATMZ:' sdt nldatmz.;  
put 'SAS datetime NLDATMWZ:' sdt nldatmwz.;  
run;
```

Here is the output:

```
Time NLDATMTZ:18:33:40 +0500
SAS datetime NLDATMZ:2013-03-17T14:30:22 +0500
SAS datetime NLDATMWZ:Sunday, March 17, 2013 07:30:22 PM +0500
```

For more information, see “NLDATMTZw. Format” on page 188, “NLDATMZw. Format” on page 202, and “NLDATMWZw. Format” on page 191.

Time Zone Example

This example shows the arrival time of a flight from Los Angeles to Tokyo:

```sas
/* Set the time zone */
options timezone='America/Los_Angeles';
data depart;
/* Set the departure time */
   depart='2013-05-17T09:15:00-08:00'dt;
   put 'Depart Los Angeles: ' depart nldatmtz.;
/* Set the flight time */
```
ftime='13:00't;
put 'Flight time=' ftime time.;
utc=depart+ftime;
put 'Arrive PST=' utc nldatmwz.;
put 'Arrive UTC=' utc nldatmwz.;
run;
/* Set the time zone for Tokyo */
options timezone='Asia/Tokyo';
data arrive;
set depart;
put 'Arrive in Tokyo ' utc nldatmwz.;
run;

Here is the output:

Depart Los Angeles: Friday, May 17, 2013 10:15:00 AM -0700
Flight time=13:00:00
Arrive PST=Friday, May 17, 2013 11:15:00 PM -0700
Arrive UTC=Friday, May 17, 2013 11:15:00 PM -0700
NOTE: The data set WORK.DEPART has 1 observations and 3 variables.
NOTE: DATA statement used (Total process time):
real time 0.01 seconds
cpu time 0.01 seconds

/* Set the time zone for Tokyo */
options timezone='Asia/Tokyo';
data arrive;
set depart;
put 'Arrive in Tokyo ' utc nldatmwz.;
run;

Arrive in Tokyo Friday, May 17, 2013 11:15:00 PM +0900
NOTE: There were 1 observations read from the data set WORK.DEPART.
NOTE: The data set WORK.ARRIVE has 1 observations and 3 variables.
NOTE: DATA statement used (Total process time):
real time 0.01 seconds
cpu time 0.01 seconds

Requirement: MAUTOSOURCE system option

Syntax
%KLOWCASE (text | text expression)
%QKLOWCAS (text | text expression)

Details
The %KLOWCASE and %QKLOWCAS macros change uppercase alphabetic characters to their lowercase equivalents. If the argument might contain a special character or mnemonic operator, listed below, use %QKLOWCAS.

%KLOWCASE returns a result without quotation marks, even if the argument has quotation marks. %QKLOWCAS produces a result with the following special characters and mnemonic operators masked so that the macro processor interprets them as text instead of as elements of the macro language:

& % ' " ( ) + - * / < > = ¬ ^ ~ ; , blank AND OR NOT EQ NE LE LT GE GT IN

Autocall macros are included in a SAS library. This library might not be installed at your site or might be a site-specific version. If you cannot access this macro or if you want to find out if the library is a site-specific version, see your on-site SAS support personnel.

%KTRIM Autocall Macro

%QKTRIM Autocall Macro
Trim trailing blanks.
Category: DBCS
%KTRIM (text | text expression)
%QKTRIM (text | text expression)

Details
The KTRIM macro and the QKTRIM macro trim trailing blanks. If the argument contains a special character or mnemonic operator, listed below, use %QKTRIM.

QKTRIM produces a result with the following special characters and mnemonic operators masked so that the macro processor interprets them as text instead of as elements of the macro language:

& % ' " ( ) + - * / < > = ¬ ? ~ ; , # blank AND OR NOT EQ NE LE LT GE GT IN

Autocall macros are included in a SAS library. This library might not be installed at your site or might be a site-specific version. If you cannot access this macro or if you want to find out if the library is a site-specific version, see your on-site SAS support personnel.

%KVERIFY Autocall Macro
Returns the position of the first character unique to an expression.

Syntax
%KVERIFY (source, excerpt)

Syntax
source
is text or a text expression that you want to examine for characters that do not exist in excerpt.

excerpt
is text or a text expression that defines the set of characters that %KVERIFY uses to examine source.

Details
%KVERIFY returns the position of the first character in source that is not also present in excerpt. If all characters in source are present in excerpt, %KVERIFY returns 0.

Autocall macros are included in a SAS library. This library might not be installed at your site or might be a site-specific version. If you cannot access this macro or if you
want to find out if the library is a site-specific version, see your on-site SAS support personnel.
Dictionary of Data Set Options for NLS

Data Set Options by Category

NLS affects the data set control category of options for selected data set options. The following table provides brief descriptions of the data set options. For more detailed descriptions, see the dictionary entry for each data set option:

<table>
<thead>
<tr>
<th>Category</th>
<th>Language Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Set Control</td>
<td>ENCODING= Data Set</td>
<td>Overrides the encoding to use for reading or writing a SAS data set.</td>
</tr>

<td></td>
</tr>
<tr>
<td></td>
<td>OUTREP= Data Set</td>
<td>Specifies the data representation for the output SAS data set.</td>
</tr>
<tr>
<td></td>
<td>Option (p. 72)</td>
<td></td>
</tr>
</tbody>
</table>

Dictionary

ENCODING= Data Set Option

Overrides the encoding to use for reading or writing a SAS data set.

Valid in: DATA step and PROC steps

Category: Data Set Control
Syntax

**ENCODING=** ANY | ASCIIANY | EBCDICANY | *encoding-value*

Syntax Description

**ANY**
specifies that no transcoding occurs.

*Note* ANY is a synonym for binary. Because the data is binary, the actual encoding is irrelevant.

**ASCIIANY**
specifies that no transcoding occurs when the mixed encodings are ASCII encodings.

**EBCDICANY**
specifies that no transcoding occurs when the mixed encodings are EBCDIC encodings.

**encoding-value**
specifies an encoding value.

*See* Chapter 3, “Encoding for NLS,” on page 9

Details

The value for ENCODING= indicates that the SAS data set has a different encoding from the current session encoding. When you read data from a data set, SAS transcodes the data from the specified encoding to the session encoding. When you write data to a data set, SAS transcodes the data from the session encoding to the specified encoding.

**Input Processing**

By default, encoding for input processing is determined as follows:

- If the session encoding and the encoding that is specified in the file are different, SAS transcodes the data to the session encoding.
- If a file has no encoding specified, but the file’s data representation is different from the encoding of the current session, then SAS transcodes the data to the current session.

**Output Processing**

By default, encoding for output processing is determined as follows:

- Data is written to a file using the encoding of the current session, except when a different output representation is specified using the OUTREP= data set option, the OUTENCODING= option in the LIBNAME statement, or the ENCODING= data set option.
- If a new file replaces an existing file, then the new file inherits the encoding of the existing file.
- If an existing file is replaced by a new file that was created under a different operating environment or that has no encoding specified, the new file uses the encoding of the current session.
Note: Character metadata and data output appears garbled if you specify a different encoding from where the data set was created. In this example, the data set to be printed is internally encoded as ASCII. However, the data set option specifies an EBCDIC encoding. SAS attempts to transcode the data from EBCDIC to ASCII, but the data is already in ASCII. The result is garbled data.

data a;
x=1;
abc='abc';
run;
proc print data=a (encoding="ebcdic");
run;

Note: The following values for ENCODING= are invalid:
- UCS2
- UCS4
- UTF16
- UTF32

Comparisons
- Session encoding is specified using the ENCODING= system option or the LOCALE= system option, with each operating environment having a default encoding.
- You can specify encoding for a SAS library by using the LIBNAME statement's INENCODING= option (for input files) and the OUTENCODING= option (for output files). If both the LIBNAME statement option and the ENCODING= data set option are specified, SAS uses the data set option.

Examples:

Example 1: Creating a SAS Data Set with Mixed Encodings and with Transcoding Suppressed

By specifying the data set option ENCODING=ANY, you can create a SAS data set that contains mixed encodings, and suppress transcoding for either input or output processing.

In this example, the new data set MYFILES.MIXED contains some data that uses the Latin1 encoding, and some data that uses the Latin2 encoding. When the data set is processed, no transcoding occurs. For example, the correct Latin1 characters in a Latin1 session encoding and correct Latin2 characters in a Latin2 session encoding are displayed.

libname myfiles 'SAS data-library';
data myfiles.mixed (encoding=any);
   set work.latin1;
   set work.latin2;
run;
Example 2: Creating a SAS Data Set with a Particular Encoding

For output processing, you can override the current session encoding. This action might be necessary, for example, if the normal access to the file uses a different session encoding.

For example, if the current session encoding is WLatin1, you can specify ENCODING=W_LATIN2 in order to create the data set that uses the encoding WLatin2. The following statements tell SAS to write the data to the new data set using the WLatin2 encoding instead of the session encoding. The encoding is also specified in the descriptor portion of the file.

```sas
libname myfiles 'SAS data-library';
data myfiles.difencoding (encoding=wlatin2);
  .
  .
run;
```

Example 3: Overriding Encoding for Input Processing

For input processing, you can override the encoding that is specified in the file, and specify a different encoding.

For this example, the current session encoding is EBCDIC-870, but the file has the encoding value EBCDIC-1047 in the descriptor information. By specifying ENCODING=EBCDIC-870, SAS does not transcode the data, but instead displays the data using EBCDIC-870 encoding.

```sas
proc print data=myfiles.mixed (encoding=ebcdic870);
run;
```

Dictionary of Formats for NLS .......................................... 89
Overview to NLS Formats

International Date and Datetime Formats

SAS supports international formats that are equivalent to some of the most commonly used English-language date formats. In each case the format works like the corresponding English-language format. Only the maximum, minimum, and default widths are different.

Table 9.1 International Date and Datetime Formats

</tbody>
</table>
Currency Representation

Overview to Currency

Currency is the medium of exchange, which is specific to a country. SAS provides formats and informats for reading and writing currency.

U.S. Dollars

The DOLLARw.d formats and informats were first introduced to read and write American currency. DOLLARw.d

- uses the dollar sign ($) currency symbol to precede U.S. currency
- uses a comma (,) as the thousands separator and a dot (.) as the decimal separator.

Example:

$12,345.00

DOLLARXw.d also writes currency with a leading dollar sign ($), but uses a dot (.) as the thousands separator and a comma (,) as the decimal separator. The reversal of the dot and comma for currency formatting is a convention used in many European countries.

Example:

$12.345,00

Limitations of the DOLLAR formats and informats are:

- the lack of support for all currency symbols
- the reversal of the dot and comma for currency formatting is not used by all European countries.
- the appearance of the currency symbol varies by computer (an EBCDIC-based computer and an ASCII-based computer render characters differently).

Euros

The EUROw.d formats and informats were introduced to support the euro currency that was established by the European Monetary Union (EMU), which was formed in 1999. EUROw.d

Example:

options locale=English_UnitedKingdom;
data _null_;
x=12345;
put x euro10.2;
run;

Output:
E12.345,00

Euro format is not locale-sensitive. It uses a comma(,) as the thousands separator and a dot (.) as the decimal separator.

Customized Currency Representations

To create a customized currency representation, you can use the FORMAT procedure. The following example shows the creation of unique formats for the Australian dollar, the Swiss franc, and the British pound. For details about the FORMAT procedure, see Base SAS Procedures Guide.

Example Code 9.1  SAS Code That Customizes Currency Representations

```sas
proc format;
    picture aud low-<0='0,000,000,009.00'
        (prefix='-AU$' mult=100)
        0–high='0,000,00,009.00'
        (prefix='AU$' mult=100);

    picture sfr low-<0='0,000,000,009.00'
        (prefix='-SFr.' mult=100)
        0–high='0,000,00,009.00'
        (prefix='-SFr.' mult=100);

    picture bpd low-<0='0,000,000,009.00'
        (prefix='-BPd.' mult=100)
        0–high='0,000,00,009.00'
        (prefix='BPd.' mult=100);
run;

data currency;
    input aud sfr bpd 12.2;
    datalines;
        12345 12345 12345
        0 0 0
        -12345 -12345 -12345
    ;

    proc print data=currency noobs;
        var aud sfr bpd;
        format aud aud. sfr sfr. bpd bpd.;
        title 'Unique Currency Formats';
    run;
```
Customizing currency representations offers flexibility, but requires a programming solution.

Localized National and International Currency Representations

The NLMNYw.d and NLMNYIw.d formats and informats were introduced to represent localized currency in two forms:

Localized national currency representation reflects the customs and conventions of the locale. National formats are specified using the NLMNYw.d formats and informats. You must also use the LOCALE= option to specify the locale when using the NLMNYw.d formats and informats.

Example:

```sas
options locale=english_UnitedStates;
data _null_;  
x=12345;       
put x nlmny15.2; 
run;
```

Output:

$12,345.00

Selected national currency representations follow:

Table 9.2  Localized National Currency Representations

<table>
<thead>
<tr>
<th>LOCALE</th>
<th>Currency</th>
<th>National Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>English_UnitedStates</td>
<td>U.S. dollars</td>
<td>$12,345.00</td>
</tr>
<tr>
<td>French_Canada</td>
<td>Canadian dollars</td>
<td>12 345,00 $</td>
</tr>
<tr>
<td>French_France</td>
<td>Euros</td>
<td>12 345,00 €</td>
</tr>
<tr>
<td>French_Switzerland</td>
<td>Swiss francs</td>
<td>SFr. 12'345.00</td>
</tr>
<tr>
<td>German_Germany</td>
<td>Euros</td>
<td>12.345,00 €</td>
</tr>
<tr>
<td>German_Luxembourg</td>
<td>Euros</td>
<td>12.345,00 €</td>
</tr>
<tr>
<td>Spanish_Spain</td>
<td>Euros</td>
<td>12.345,00 €</td>
</tr>
</tbody>
</table>
The localized renderings show the native customs for representing currency. For example, although these selected EMU countries might use the same euro currency, their depiction of the currency varies. Whereas French_France uses no thousands separator but uses a comma as a decimal separator, German_Germany and Spanish_Spain use a dot as a thousands separator and a comma as a decimal separator.

Localized international currency representation conforms to ISO standard 4217. International forms are specified using the NLMNYIw.d formats and informats. International forms are commonly used to show a comparison of world currencies. Examples are airline ticket, trade, and stock market pricing. You must also use the LOCATE= option to specify the locale when using the NLMNYIw.d formats and informats. The letter “I,” which signifies “International,” is appended to the format and informat names.

Example:

```plaintext
options locale=english_UnitedStates;
data _null_;  
x=12345; put x nlmnyi15.2;  
run;
```

Output:

USD12,345.00

Selected international currency representations follow:

<table>
<thead>
<tr>
<th>LOCALE=</th>
<th>Currency</th>
<th>International Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spanish_Venezuela</td>
<td>Venezuelan bolivars</td>
<td>VEF12.345,00</td>
</tr>
</tbody>
</table>

The international renderings also reflect native customs for representing currency. For example, not every locale uses a comma as the thousands separator.
separator and a dot as the decimal separator. When used, the ISO currency code placement varies by locale. Whereas the EMU countries put the currency code after the currency, English_UntitedStates, German_Switzerland, and Spanish_Venezuela precede the currency with the ISO code.

For a complete list of the ISO standard 4217 currency codes, see http://www.xe.com/iso4217.php.

A primary limitation of using localized national and international currency representations is their dependence on a value for the LOCALE= system option.

## Unique National and International Monetary Representations

The NLMNYISOw.d and NLMNYI ISOw.d formats and informats were introduced to uniquely represent each currency without having to also use the LOCALE= option. Each currency is specified by a unique ISO standard 4217 currency code.

NLMNY and NLMNYI formats return results that display the number that is found in the data with a currency symbol that matches the current SAS LOCALE option. SAS does not convert the value from one currency to another. If the LOCALE changes, the same number is displayed with a different currency symbol. A changed currency symbol does not guarantee that the value has changed.

Unique national monetary representation is specified by the unique ISO currency code. National formats are specified using the NLMNLISOw.d formats and informats. In the following example, USD is the ISO currency code for American dollars.

---

**Note:** When using the NLMNLISOw.d formats and informats, the LOCALE= option is optional.

---

**Example:**

```sas
data _null_;  
  put x nlmnlusd15.2;  
run;
```

**Output:**

US$12,345.00

Selected unique national currency representations follow:

**In this example, locale is specified as fr_FR.**

```sas
data _null_;  
x=12345;  
  put x nlmnleur15.2;  
run;
```

**Output:**

€12,345.00
Table 9.4 Unique Currency Representations by ISO Currency Code

<table>
<thead>
<tr>
<th>ISO Currency Code</th>
<th>Currency</th>
<th>National Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>USD</td>
<td>U.S. dollars</td>
<td>US$12,345.00</td>
</tr>
<tr>
<td>CAD</td>
<td>Canadian dollars</td>
<td>CA$12,345.00</td>
</tr>
<tr>
<td>EUR</td>
<td>Euros</td>
<td>€12,345.00</td>
</tr>
<tr>
<td>CHF</td>
<td>Swiss francs</td>
<td>SFr.12,345.00</td>
</tr>
<tr>
<td>EUR</td>
<td>Euros</td>
<td>€12,345.00</td>
</tr>
<tr>
<td>EUR</td>
<td>Euros</td>
<td>€12,345.00</td>
</tr>
<tr>
<td>EUR</td>
<td>Euros</td>
<td>€12,345.00</td>
</tr>
<tr>
<td>VEB</td>
<td>Venezuelan bolivars</td>
<td>BsF.12,345.00</td>
</tr>
</tbody>
</table>

A currency symbol or a currency code precedes most currencies. Also, a comma is used as the thousands separator and a dot as the decimal separator. If the currency symbol of the local currency is not supported in the current SAS session encoding, the NLMNLxxxw.d format, formats the value with the 3-letter ISO currency code.

Unique international monetary representation is specified by the unique ISO currency code. International formats are specified using the NLMNI/ISOw.d formats and informats. International forms are commonly used to show a comparison of world currencies (for example, airline ticket, trade, and stock market pricing). The letter “I”, which signifies “International”, is appended to the format and informat names. In the following example, USD is the ISO currency code for American dollars.

Note: When using the NLMNI/ISOw.d formats and informats, do not use the LOCALE= option to specify the locale.

```plaintext
data _null_;  
  x=12345;  
  put x nlmniusd15.2;  
run;
```

Output:

USD12,345.00

Selected international currency representations follow:
Table 9.5  International Currency Representations by ISO Currency Code

<table>
<thead>
<tr>
<th>ISO Currency Code</th>
<th>Currency</th>

<td>VEB</td>
<td>Venezuelan bolivars</td>
<td>Not found</td>
</tr>
</tbody>
</table>

The international renderings precede the currency with the appropriate ISO code. Also used are a comma as the thousands separator and a dot as the decimal separator.

Example: Representing Currency in National and International Formats

This SAS program uses the exchange rates for selected Asia-Pacific countries against the U.S. dollar. In the output, each country's currency is represented using a national format and an international format.

Example Code 9.2  SAS Code That Formats National and International Currency Formats

```sas
data curr;
  input ex_date mmddyy. usd aud hkd jpy sgd 12.2;
datalines;
  061704 1.00000 1.45349 7.79930 110.110 1.71900
; proc print data=curr noobs label;
  var ex_date usd aud hkd jpy sgd;
  format ex_date mmddyy. usd nlmnlusd15.2 aud nlmnlaud15.2 hkd nlmnlhkdl5.2
  jpy nlmnljpy15.2 sgd nlmnlsgd15.2;  
  label ex_date='Date' usd='US' aud='Australia' hkd='Hong Kong' jpy='Japan' sgd='Singapore';
  title 'Exchange Rates for Selected Asian-Pacific Countries (Localized Currency Codes)';
proc print data=curr noobs label;
  var ex_date usd aud hkd jpy sgd;
  format ex_date mmddyy. usd nlmnlusd15.2 aud nlmnlaud15.2 hkd nlmnlhkdl5.2 jpy nlmnljpy15.2 sgd nlmnlsgd15.2;  
  label ex_date='Date' usd='US' aud='Australia' hkd='Hong Kong' jpy='Japan' sgd='Singapore';
```

Example: Representing Currency in National and International Formats

This SAS program uses the exchange rates for selected Asia-Pacific countries against the U.S. dollar. In the output, each country's currency is represented using a national format and an international format.

Example Code 9.2  SAS Code That Formats National and International Currency Formats

```sas
data curr;
  input ex_date mmddyy. usd aud hkd jpy sgd 12.2;
datalines;
  061704 1.00000 1.45349 7.79930 110.110 1.71900
; proc print data=curr noobs label;
  var ex_date usd aud hkd jpy sgd;
  format ex_date mmddyy. usd nlmnlusd15.2 aud nlmnlaud15.2 hkd nlmnlhkdl5.2
  jpy nlmnljpy15.2 sgd nlmnlsgd15.2;  
  label ex_date='Date' usd='US' aud='Australia' hkd='Hong Kong' jpy='Japan' sgd='Singapore';
  title 'Exchange Rates for Selected Asian-Pacific Countries (Localized Currency Codes)';
proc print data=curr noobs label;
  var ex_date usd aud hkd jpy sgd;
  format ex_date mmddyy. usd nlmnlusd15.2 aud nlmnlaud15.2 hkd nlmnlhkdl5.2 jpy nlmnljpy15.2 sgd nlmnlsgd15.2;  
  label ex_date='Date' usd='US' aud='Australia' hkd='Hong Kong' jpy='Japan' sgd='Singapore';
```

title 'Exchange Rates for Selected Asian-Pacific Countries (International Currency Codes)';

1 These exchange rates, which were effective June 17, 2004, are specified as data in the SAS program.

2 These NLMNL/ISO formats are applied to each of the numeric data items that are specified in the INPUT statement. These formats show currencies in the appropriate national formats.

3 These NLMNI/ISO formats are applied to each of the numeric data items that are specified in the INPUT statement. These formats show currencies in the appropriate international formats.

Figure 9.1 National and International Format Output

Exceptions for Date and Time Default Widths

The length of the month-name and the week-name in some locale and encoding combinations might exceed the default width in some formats. Do not use the default width for these combinations. Refer to the following tables for the affected locales, encodings, and formats. Use the recommended widths for accurate output.

The following table lists the encoding and locale combinations where the localized output might exceed the default width.

<table>
<thead>
<tr>

</table>
**Categories of NLS Formats**

Some formats run in SAS only, and some formats run in SAS and on the CAS engine. If CAS is specified for the format category, then the format runs in SAS and on the CAS server. If CAS is not specified for the format category, then the format runs in SAS only. For example, the NLSDATE format runs in SAS and on the CAS server, so CAS is specified as a category. The $UNCR format runs on SAS only, so CAS is not specified as a category.

The following categories relate to NLS issues:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIDI Text Handling</td>
<td>Instructs SAS to write bidirectional data values from data variables.</td>
</tr>
<tr>
<td>CAS</td>
<td>Instructs SAS that these formats run on the CAS server.</td>
</tr>
<tr>
<td>Character</td>
<td>Instructs SAS to write character data values from character variables.</td>
</tr>
<tr>
<td>Currency Conversion</td>
<td>Instructs SAS to convert an amount from one currency to another currency.</td>
</tr>
<tr>
<td>DBCS</td>
<td>Instructs SAS to translate double-byte-character sets that are used in Asian languages.</td>
</tr>
<tr>
<td>Hebrew Text Handling</td>
<td>Instructs SAS to read Hebrew data from data variables.</td>
</tr>
<tr>
<td>International Date and Time</td>
<td>Instructs SAS to write data values from variables that represent dates, times, and datetimes.</td>
</tr>
<tr>

**Dictionary**

**B8601DXw. Format**

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone basic notation `yyyyymmddThhmmss +hhmm`.

**Categories:** Date and Time

**ISO 8601**

**Alignment:** Left

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Supports:** ISO 8601 Element 5.4.1, complete representation
Syntax

**B8601DX**<sup>w</sup>.

Syntax Description

<sup>**w**</sup> specifies the width of the output field.

**Default** 26

**Range** 20–35

Details

UTC values specify a date and a time that are based on the zero meridian in Greenwich, England. Using this format, SAS converts a datetime value to the UTC value and determines the user local date and time by using the value of the TIMEZONE= system option. If the TIMEZONE= option is not set, then the user local date and time are based on the local date and time. The B8601DX format writes SAS datetime values by using the following ISO 8601 basic datetime notation:

\[
\text{yyyyymmddT}hhmmss+\text{hhmm}
\]

*yyyy* is a four-digit year.

*mm* is a two-digit month (zero padded) between 01 and 12.

*dd* is a two-digit day of the month (zero padded) between 01 and 31.

*hh* is a two-digit hour (zero padded) between 00 and 23.

*mm* is a two-digit minute (zero padded) between 00 and 59.

*ss* is a two-digit second (zero padded) between 00 and 59.

*+|–hhmm* is an hour and minute signed offset from zero meridian time. The offset must be *+|–hhmm* (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form *+|–hh* is not supported.

Example

The first example uses the local time to determine the time and the time zone offset.
The second example changes the time zone to America/Adak, which is Hawaii-Aleutian Time.
### B8601LXw. Format

Writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 basic notation `yyyyymmddThhmmss+|–hhmm`.

**Categories:** Date and Time  
ISO 8601

**Alignment:** Right

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Supports:** ISO 8601 Elements 5.3.3 and 5.3.4.2

### Syntax

**B8601LXw**

**Syntax Description**

- `w` specifies the width of the output field.

  **Default** 26  
  **Range** 20–35

**Details**

The B8601LX format writes datetime values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using the ISO 8601 basic datetime notation:

- `yyyyymmddThhmmss+|–hhmm`
**yyyy**

is a four-digit year.

**mm**

is a two-digit month (zero padded) between 01 and 12.

**dd**

is a two-digit day of the month (zero padded) between 01 and 31.

**hh**

is a two-digit hour (zero padded) between 00 and 23.

**mm**

is a two-digit minute (zero padded) between 00 and 59.

**ss**

is a two-digit second (zero padded) between 00 and 59.

**+|–hhmm**

is an hour and minute signed offset from zero meridian time. The offset must be 

**+|–hhmm** (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use − for time zones west of 
the zero meridian. For example, +0200 indicates a two-hour time difference to 
the east of the zero meridian, and −0600 indicates a six-hour time difference to 
the west of the zero meridian.

**Restriction:** The shorter form **+|–hh** is not supported.

### Example

This PUT statement writes the time for the Eastern Standard time zone:

```sas
b1x=’01Feb2013T12:34:56’dt;
p= b1x b8601lx.;
```

<table>
<thead>
<tr>
<th>Value of b1x</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1675341296</td>
<td>20130201T123456-0500</td>
</tr>
</tbody>
</table>

Notations" in *SAS Formats and Informats: Reference*

---

**B8601TXw. Format**

Adjusts a Coordinated Universal Time (UTC) value to the user’s local time. Then, writes the local time by 
using the ISO 8601 basic time notation **hmmss+|–hmm**.

**Categories:** Date and Time

**ISO 8601**

**Alignment:** Right

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Supports:** ISO 8601 Elements 5.3.3 and 5.3.4
Syntax

B8601TXw.

Syntax Description

w
specifies the width of the output field.

Default  14

Range   9–20

Details

UTC values specify a time based on the zero meridian in Greenwich, England. Using this format, SAS converts a time value to the UTC value and determines the user local time by using the TIMEZONE= system option. If the TIMEZONE= option is not set, then the user local time is based on the local time. The B8601TX format writes SAS datetime values by using the following ISO 8601 basic time notation:

- hhmmss+|–hhmm
  - hh
    - is a two-digit hour (zero padded) between 00 and 23.
  - mm
    - is a two-digit minute (zero padded) between 00 and 59.
  - ss
    - is a two-digit second (zero padded) between 00 and 59.
  - +|–hhmm
    - is an hour and minute signed offset from zero meridian time. The offset must be +|–hhmm (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to the east of the zero meridian, and –0600 indicates a six-hour time difference to the west of the zero meridian.

Restriction: The shorter form +|–hh is not supported.

When SAS reads a UTC time by using the B8601TZ informat, and the adjusted time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that the time is between 000000 and 240000. If the B8601TX format attempts to format a time outside of this time range, the time is formatted with asterisks to indicate that the value is out of range.

Example

The first example uses the local time to determine the time and the time zone offset. The second example changes the time zone to America/Adak, which is Hawaii-Aleutian Time.
|| Statement                  | Result     |
|---------------------------|------------|
| data _null_;              |            |
| t='12:34:56't;            |            |
| put t b8601tx.;          | 073456-0500|
| run;                      |            |
| options timezone='America/Adak'; | 023456-1000|
| data _null_;              |            |
| t='12:34:56't;            |            |
| put t b8601tx.;          |            |
| run;                      |            |

**See Also**

**BESTDOTXw. Format**

Specifies that SAS choose the best notation and use a dot as a decimal separator.

**Category:** Numeric

**Alignment:** Right

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Syntax**

**BESTDOTXw.**

**Syntax Description**

w

specifies the width of the output field.

- **Default:** 12
- **Range:** 1–32
- **Tip:** If you print numbers between 0 and .01 exclusively, use a field width of at least 7 to avoid excessive rounding. If you print numbers between 0 and -01 exclusively, use a field width of at least 8.

**Details**

If the NLDECSEPARATOR system option is disabled, the BESTw and BESTDOTXw formats process data the same way. If the NLDECSEPARATOR system option is enabled, then the results from the BEST and BESTDOTX formats are different. See the following table to understand the differences:
<table>
<thead>
<tr>
<th>LOCALE option</th>
<th>Default decimal separator character for the locale</th>
<th>NLDECSEPARATOR option</th>
<th>Separator character used by BESTw.</th>
<th>Separator character used by BESTDOTXw.</th>
</tr>
</thead>
<tbody>
<tr>
<td>en_US</td>
<td>Dot</td>
<td>Disabled (default)</td>
<td>Dot</td>
<td>Dot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enabled</td>
<td>Dot</td>
<td>Dot</td>
</tr>
<tr>
<td>fr_FR</td>
<td>Comma</td>
<td>Disabled (default)</td>
<td>Dot</td>
<td>Dot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enabled</td>
<td>Comma</td>
<td>Dot</td>
</tr>
</tbody>
</table>

**Example**

The following code produces results using the BESTDOTX format with the NLSDECSEPARATOR option enabled and the locale set to fr_FR.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options nld locale=fr_FR;</td>
<td>1,2</td>
</tr>
<tr>
<td>data <em>null</em>;</td>
<td>1.2</td>
</tr>
<tr>
<td>x=1.2;</td>
<td></td>
</tr>
<tr>
<td>call symput('macx', put(x, BESTDOTX.));</td>
<td></td>
</tr>
<tr>
<td>put x; /* Result is printed as &quot;1,2&quot; */</td>
<td>1.2</td>
</tr>
<tr>
<td>y=put(x, BESTDOTX.); /*Result is printed as &quot;1.2&quot; */</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
<tr>
<td>&amp;put &amp;macx;</td>
<td>1.2</td>
</tr>
<tr>
<td>data <em>null</em>;</td>
<td>1.2</td>
</tr>
<tr>
<td>bx=&amp;macx; /* Succeeds because the value of &amp;macx is 1.2 */</td>
<td></td>
</tr>
<tr>
<td>put bx;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**$BIDIw. Format**

Converts between a logically ordered string and a visually ordered string, by reversing the order of Hebrew and Arabic characters while preserving the order of Latin words and numbers.

Category: BIDI Text Handling

Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$BIDI_{w}$. 

Syntax Description

\( w \)

specifies the width of the output field.

Default 1 if \( w \) is not specified

Range 1–32767

Details

In the Windows operating environment, Hebrew and Arabic text is stored in logical order. The text is stored in the order in which it is written and not necessarily as it is displayed. However, in other operating environments, Hebrew text is stored in the same order it is displayed. SAS users can encounter Hebrew and Arabic text that is reversed. Such situations can occur when you use SAS/CONNECT or other software to transfer SAS data sets or reports with Hebrew and Arabic text from a visual operating environment to a logical one. The $BIDI format is a format that reverses Hebrew and Arabic text while maintaining the order of numbers and Latin-1 words.

Operating Environment Information: In mainframe operating environments, this format is designed to work with NewCode Hebrew and Arabic. Some mainframe operating environments might experience unsatisfactory results, because they use the OldCode Hebrew or Arabic encoding. There is a hotfix for this encoding on SAS Institute’s Web site.

Comparisons

The $BIDI_{w}$. format performs a reversing function similar to the $REVERJ_{w}$. format, which writes character data in reverse order and preserves blanks. $BIDI_{w}$. behaves in the following way:

- $BIDI_{w}$. reverses the order of words and numbers in a specified string, preserving blanks. Latin-1 words and numbers themselves are not reversed, only their order in the string.
- When $BIDI$ encounters a word consisting of Hebrew or Arabic characters in the text string, the characters in the Hebrew or Arabic word are reversed. The position of the Hebrew or Arabic word is reversed in the string.

Example

This example demonstrates how $BIDI_{w}$. reverses Hebrew characters. The Hebrew is reversed in the string. The Hebrew characters in the words are also reversed.
The following lines are written to the SAS log:

```
808182x

123
```

### $\text{CPTDW}_w$. Format

Processes a character string that is in Hebrew text, encoded in IBM-PC (cp862), and then writes the character string in Windows Hebrew encoding (cp 1255).

- **Category:** Hebrew Text Handling
- **Alignment:** Left
- **Restriction:** This format is not supported in a DATA step that runs in CAS.

#### Syntax

```
$\text{CPTDW}_w$
```

#### Syntax Description

- **w** specifies the width of the output field.
  - **Default:** 200
  - **Range:** 1–32767

#### Comparisons

The $\text{CPTDW}_w$. format performs processing that is the opposite of the $\text{CPTWD}_w$. format.

#### Example

The following example uses the input value of "808182x."

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $\text{cptdw3.};$</td>
<td>123</td>
</tr>
</tbody>
</table>
$CPTWDw. Format

Processes a character string that is encoded in Windows (cp1255), and then writes the character string in Hebrew DOS (cp862) encoding.

Category: Hebrew Text Handling
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$CPTWDw.

Syntax Description

w
specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>1–32767</td>
</tr>
</tbody>
</table>

Comparisons

The $CPTWDw. format performs processing that is the opposite of the $CPTDWw. format.

Example

The following example uses the input value of “שלום”.

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $cptwd1.;</td>
<td>€□,</td>
</tr>
</tbody>
</table>

DTWEEKVww. Format

Writes a week and datetime number in decimal format by using the V algorithm.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

DTWEEKVw.

Syntax Description

w

specifies the width of the output field.

Default 18

Range 3–200

Details

This table has information on widths, formats, and examples:

<table>
<thead>
<tr>
<th>Width</th>
<th>Format</th>
<th>Example</th>

<td>2003w0101:09:10:56</td>
</tr>
<tr>
<td>20–200</td>
<td>yyyy-Www-dd:hh:mm:ss</td>
<td>2003-w01-01:09:10:56</td>
</tr>
</tbody>
</table>

Example

Here is an example of the DTWEEKw. format:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA <em>NULL</em>;</td>
<td>t=2017-W05-03:01:02:03</td>
</tr>
<tr>
<td>t='01Feb2017:1:2:3'dt;</td>
<td></td>
</tr>
<tr>
<td>put t= DTWEEKV30.;</td>
<td></td>
</tr>
<tr>
<td>RUN;</td>
<td></td>
</tr>
</tbody>
</table>

$EBCDICw. Format

Converts native format character data to EBCDIC representation.

Category: Character

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.

Note: UTF-8 is the only supported session encoding. $EBCDIC format works only for 7-bit ASCII characters.

Syntax

$EBCDICw.

Syntax Description

w

specifies the width of the output field.

Default 1

Range 1–32767

Details

If EBCDIC is the native format, no conversion occurs.
On ASCII systems, the $EBCDICw.$ format is based on the default encoding value of the LOCALE= option that is specified when SAS starts. For example, if the locale was set to en_US locale, the default encoding that is used by the $EBCDICw.$ format is Open ed-1047. If the locale is de_DE (German_Germany), the default encoding that is used by the $EBCDICw.$ format is Open ed–1141. For a list of locales and encoding values, see Table 21.2 on page 817.

You can specify the translation table that is used to map characters between EBCDIC and ASCII by using the MAPEBCDIC2ASCII system option. For more information, see “MAPEBCDIC2ASCII= System Option” on page 702.

Comparisons

- On ASCII systems, $EBCDICw.$ converts ASCII character data to EBCDIC.
- On all other systems, $EBCDICw.$ behaves like the $CHARw.$ format.

Example

data one;
  input x $;
  datalines;
  ABC
  {ä}
  [@]
; run;

data two;
  set one;
  y=put(x,$ebcdic3.);
  put y $HEX6.; run;

Table 10.1 Output Locale Values for American English, French, and German

<table>
<thead>
<tr>
<th>Value of name</th>
<th>Locale Value Is en_US</th>
<th>Locale Value Is fr_FR</th>
<th>Locale Value Is de_DE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABC</td>
<td>C1C2C3</td>
<td>C1C2C3</td>
<td>C1C2C3</td>
</tr>
<tr>
<td>{ä}</td>
<td>C043D0</td>
<td>514354</td>
<td>43C0DC</td>
</tr>
<tr>
<td>[@]</td>
<td>AD7CBD</td>
<td>9044B5</td>
<td>63B5FC</td>
</tr>
</tbody>
</table>

The results are shown as hexadecimal representations of EBCDIC codes for characters. Each pair of hexadecimal characters correspond to one byte of binary data, and each byte corresponds to one character.
E8601DXw. Format

Adjusts a Coordinated Universal Time (UTC) datetime value to the user’s local date and time. Then, writes the local date and time by using the ISO 8601 datetime and time zone extended notation yyyy-mm-ddThh:mm:ss+hh:mm.

**Categories:** Date and Time, ISO 8601

**Alignment:** Left

**Supports:** ISO 8601 Element 5.4.1, complete representation

**Syntax**

E8601DXw.

**Syntax Description**

w specifies the width of the output field.

- **Default** 26
- **Range** 20–35

**Details**

UTC values specify a date and time that are based on the zero meridian in Greenwich, England. Using this format, SAS converts a datetime value to the UTC value and determines the user local date and time by using the value of the TIMEZONE= system option. If the TIMEZONE= option is not set, the user local date and time are based on the local date and time. The E8601DX format writes SAS datetime values by using this ISO 8601 basic datetime notation:

- yyyy-mm-ddThh:mm:ss+hh:mm

- **yyyy** is a four-digit year.

- **mm** is a two-digit month (zero padded) between 01 and 12.

- **dd** is a two-digit day of the month (zero padded) between 01 and 31.

- **hh** is a two-digit hour (zero padded) between 00 and 23.

- **mm** is a two-digit minute (zero padded) between 00 and 59.

- **ss** is a two-digit second (zero padded) between 00 and 59.
**+|−hh:mm**

is an hour and minute signed offset from zero meridian time. The offset must be +|−hh:mm (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and −06:00 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form +|−hh is not supported.

### Example

The first example uses the local time to determine the time. The second example changes the time zone to America/Adak, which is Hawaii-Aleutian Time.

<table>

“Working with Dates and Times by Using the ISO 8601 Basic and Extended Notations” in [*SAS Formats and Informats: Reference*](#)

---

**E8601LXw. Format**

Writes datetime values as local time by appending a time zone offset difference between the local time and UTC, using the ISO 8601 extended notation `yyyy-mm-ddThh:mm:ss+|−hh:mm`.

- **Categories:** Date and Time, ISO 8601
- **Alignment:** Right
- **Supports:** ISO 8601 Elements 5.3.3 and 5.3.4.2

### Syntax

`E8601LXw`
Syntax Description

**w**
specifies the width of the output field.

- **Default:** 26
- **Range:** 20–35

Details

The E8601LX format writes datetime values without making any adjustments, and appends the UTC time zone offset for the local SAS session by using this ISO 8601 basic datetime notation:

```
yyyy-mm-ddThh:mm:ss+hh:mm
```

- **yyyy** is a four-digit year.
- **mm** is a two-digit month (zero padded) between 01 and 12.
- **dd** is a two-digit day of the month (zero padded) between 01 and 31.
- **hh** is a two-digit hour (zero padded) between 00 and 23.
- **mm** is a two-digit minute (zero padded) between 00 and 59.
- **ss** is a two-digit second (zero padded) between 00 and 59.
- **+|–hh:mm** is an hour and minute signed offset from zero meridian time. The offset must be **+|–hh:mm** (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +02:00 indicates a two-hour time difference to the east of the zero meridian, and –06:00 indicates a six-hour time difference to the west of the zero meridian.

**Restriction:** The shorter form **+|–hh** is not supported.

Example

This example writes the time for the Eastern time zone:

```sas
data one;
   mydt='15sep2018 T12:34:56'dt;
   put mydt e8601lx.
run;
```

<table>
<thead>
<tr>
<th>Value of mydt</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1852634096</td>
<td>2018-09-15T12:34:56-05:00</td>
</tr>
</tbody>
</table>
E8601TXw. Format

Adjusts a Coordinated Universal Time (UTC) value to the user’s local time. Then, writes the local time by using the ISO 8601 extended time notation \( hh:mm:ss +|– hh:mm \).

Categories:
- Date and Time
- ISO 8601

Alignment: Right

Supports: ISO 8601 Elements 5.3.3 and 5.3.4

Syntax

\[ \text{E8601TX} w \]

Syntax Description

\( w \)

specifies the width of the output field.

Default: 14

Range: 9–20

Details

UTC values specify a time based on the zero meridian in Greenwich, England. Using this format, SAS converts a time value to the UTC value and determines the user local time by using the value of the TIMEZONE= system option. If the TIMEZONE= option is not set, the user local time is based on the local time. The E8601TX format writes SAS datetime values by using this ISO 8601 basic time notation:

- \( hh:mm:ss +|– hh:mm \)
- \( hh \)
  - is a two-digit hour (zero padded) between 00 and 23.
- \( mm \)
  - is a two-digit minute (zero padded) between 00 and 59.
- \( ss \)
  - is a two-digit second (zero padded) between 00 and 59.
- \( +|– hh:mm \)
  - is an hour and minute signed offset from zero meridian time. The offset must be \( +|– hh:mm \) (that is, + or – and four characters).

Use + for time zones east of the zero meridian, and use – for time zones west of the zero meridian. For example, +0200 indicates a two-hour time difference to
the east of the zero meridian, and –0600 indicates a six-hour time difference to
the west of the zero meridian.

Restriction: The shorter form +|–hh is not supported.

When SAS reads a UTC time by using the E8601TZ informat, and the adjusted
time is greater than 24 hours or less than 00 hours, SAS adjusts the value so that
the time is between 000000 and 240000. If the E8601TX format attempts to format a
time outside of this time range, the time is formatted with asterisks to indicate that
the value is out of range.

Example

The first example uses the local time to determine the time and the time zone offset.
The second example changes the time zone to America/Adak, which is Hawaii-
Aleutian Time.

“Working with Dates and Times by Using the ISO 8601 Basic and Extended
Notations” in SAS Formats and Informats: Reference

EUROw.d Format

Writes numeric values with a leading euro symbol (E), a comma that separates every three digits, and a
period that separates the decimal fraction.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

\textsc{EURO}w.d
Syntax Description

**w**

specifies the width of the output field.

- **Default**: 6
- **Range**: 1-32

**Tip**

If you want the euro symbol to be part of the output, be sure to choose an adequate width.

**d**

specifies the number of digits to the right of the decimal point in the numeric value.

- **Default**: 0
- **Range**: 0-31
- **Requirement**: must be less than **w**

Comparisons

- The EURO\(w.d\) format is similar to the EUROX\(w.d\) format, but EUROX\(w.d\) format reverses the roles of the decimal point and the comma. This convention is common in European countries.

- The EURO\(w.d\) format is similar to the DOLLAR\(w.d\) format, except that DOLLAR\(w.d\) format writes a leading dollar sign instead of the euro symbol.

Example

These examples use 1254.71 as the value of amount.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put amount euro10.2;</td>

EUROXw.d Format

Writes numeric values with a leading euro symbol (E), a period that separates every three digits, and a comma that separates the decimal fraction.

Category: Numeric
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

EUROXw.d

Syntax Description

\( w \)

specifies the width of the output field.

Default 6
Range 1-32
Tip If you want the euro symbol to be part of the output, be sure to choose an adequate width.

\( d \)

specifies the number of digits to the right of the decimal point in the numeric value.
Comparisons

- The EUROXw.d format is similar to the EUROw.d format, but EUROw.d format reverses the roles of the comma and the decimal point. This convention is common in English-speaking countries.
- The EUROXw.d format is similar to the DOLLARXw.d format, except that DOLLARXw.d format writes a leading dollar sign instead of the euro symbol.

Example

These examples use 1254.71 as the value of amount.

<table>

HDATEw. Format

Writers date values in the form yyyy mmmmm dd where dd is the day-of-the-month, mmmmm represents
the month's name in Hebrew, and yyyy is the year.

Category: Date and Time
Alignment: Right
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

HDATEw.
Syntax Description

_w_  specifies the width of the output field.

**Note:** Use widths 9, 11, 15, or 17 for the best view.

**Default**  17  
**Range**  9–17

Details

The HDATEw. format writes the SAS date value in the form *yyyy mmmmm dd*:

- **yyyy**  is the year
- **mmmmm**  is English month name written in Hebrew letters
- **dd**  is the day-of-the-month

Example

The following example uses the input value of 15780, which is the SAS date of March 16, 2003.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put day hdate9.;</td>
<td>03 פ‘יון 16</td>
</tr>
<tr>
<td>put day hdat11.;</td>
<td>2003 פ‘יון 16</td>
</tr>
<tr>
<td>put day hdate17.;</td>
<td>2003 פ‘יון 16</td>
</tr>
</tbody>
</table>

See Also

**Format:**

- “HEBDATEw. Format” on page 138

---

**HEBDATEw. Format**

Writes date values according to the Jewish calendar.

**Category:** Date and Time
Syntax

HEBDATEw.

Syntax Description

\( w \)

specifies the width of the output field.

Default  
16

Range  
7–24

Tip  
When using a non-Hebrew encoding, asterisks appear instead of the Hebrew letters.

Details

The Jewish calendar is a combined solar and lunar calendar. Years are counted from the creation of the world, which according to Jewish history, occurred 3760 years and three months before the commencement of the Christian. You must add 3761, beginning in the autumn of a specified year in the Gregorian calendar to calculate the Hebrew year.

The HEBDATEw. format writes the SAS date value according to the Jewish calendar. The date is written in one of the following formats:

long

ירואו יאוד העש"ב

default

י' אוד העש"ב

short

י"ה העש"ב

Example

The following example uses the input value of 15780, which is the SAS date of March 16, 2003.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put day hebdatel3.;</td>
<td>י' יאוד העש&quot;ב</td>
</tr>
<tr>
<td>put day hebdatel6.;</td>
<td>י&quot;ה העש&quot;ב</td>
</tr>
</tbody>
</table>
### JNENGOw.d Format

Writes SAS date values as Japanese dates as reign, year, month, and day.

**Category:** Date and Time  
**Alignment:** Left  
**Restrictions:** This format is not supported in a DATA step that runs in CAS. This format is supported only in a Japanese environment.

**Syntax**

```
JNENGOw.d
```

**Optional Arguments**

- **w**  
  specifies the width of the input field.  
  - **Default:** 21  
  - **Range:** 6–200

- **d**  
  specifies these values:  
  - .0  writes all information.  
  - .1  writes Reign, Year, and Month information.  
  - .2  writes Reign and Year information.  
  - .3  writes Reign information only.  
  - **Default:** 0  
  - **Range:** 0–3
Comparisons

\texttt{JNENGOw.d} is similar to \texttt{JNENGOWw.d} except that \texttt{JNENGOw.d} uses narrow characters for numbers.

Example

This example uses the Japanese Japan session encoding. It uses the input value of 15760, which is the SAS date value that corresponds to February 24, 2003.

```
Data _null_;  
x = 15760 ;  
put x JNENGO.3;  
put x JNENGO.2;  
put x JNENGO.1;  
put x JNENGO.;  
run;
```

\textbf{JNENGOTw. Format}

Writes SAS datetime values as Japanese datetimes as reign, year, month, day, hour, and minute, and with narrow characters for numbers.

\begin{itemize}
  \item \textbf{Category:} Date and Time
  \item \textbf{Alignment:} Left
  \item \textbf{Restrictions:} This format is not supported in a DATA step that runs in CAS.
\end{itemize}

This format is supported only in a Japanese environment.

\section*{Syntax}

\texttt{JNENGOTw.}

\section*{Optional Argument}

\texttt{w}

specifies the width of the input field.

\begin{tabular}{ll}
  \textbf{Default} & 32 \\
  \textbf{Range} & 27–200 \\
\end{tabular}

\section*{Comparisons}

\texttt{JNENGOTw.} is similar to \texttt{JNENGOTWw.} except that \texttt{JNENGOTw.} uses narrow characters for numbers.
Example

This example uses the Japanese_Japan session encoding. It uses the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003.

```sas
data _null_;  
x = 1361709583 ;  
put x JNENGOT32.;  
put x JNENGOT40.;  
run;
```

JNENGOTW w. Format

Writes SAS datetime values as Japanese datetimes as reign, year, month, day, hour, and minute, and with wide characters for numbers.

Category: Date and Time

Restrictions: This format is supported only in a Japanese environment. This format is not supported in a DATA step that runs in CAS.

Alignment: Left

Syntax

JNENGOTWw.

Optional Argument

w

specifies the width of the input field.

Default 52

Range 49–200

Comparisons

JNENGOTWw. is similar to JNENGOTw. except that JNENGOTWw. uses wide characters for numbers.

Example

This example uses the Japanese_Japan session encoding. It uses the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003.

```sas
Data _null_;  
```
JNENGO\textsc{w.d} Format

Writes SAS date values as Japanese dates as reign, year, month, and day, and with wide character for numbers.

Category: Date and Time
Alignment: Left
Restrictions: This format is not supported in a DATA step that runs in CAS. This format runs only in a Japanese environment.

Syntax

\texttt{JNENGO\textsc{w.d}}

Optional Arguments

\texttt{w}

specifies the width of the input field.

Default 33
Range 6–200

\texttt{d}

specifies these values:

\begin{itemize}
  \item \texttt{.0} writes all information.
  \item \texttt{.1} writes Reign, Year, and Month information.
  \item \texttt{.2} writes Reign and Year information.
  \item \texttt{.3} writes Reign information only.
\end{itemize}

Default 0
Range 0–3

Comparisons

\texttt{JNENGO\textsc{w.d}} is similar to \texttt{JNENGO\textsc{w.d}} except that \texttt{JNENGO\textsc{w.d}} uses wide characters for numbers.
Example
This example uses the Japanese Japan session encoding. It uses the input value of 15760, which is the SAS date value that corresponds to February 24, 2003.

```
data _null;
x = 15760;
put x JNENGOW.3;
put x JNENGOW.2;
put x JNENGOW.1;
put x JNENGOW.;
run;
```

$KANJIw. Format
Adds shift-code data to DBCS data.

<table>
<thead>
<tr>
<th>Category:</th>
<th>DBCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment:</td>
<td>Left</td>
</tr>
<tr>
<td>Restriction:</td>
<td>This format is not supported in a DATA step that runs in CAS.</td>
</tr>
</tbody>
</table>

Syntax
```
$KANJIw.
```

Syntax Description

<table>
<thead>
<tr>
<th>w</th>
<th>specifies the width of the output field.</th>
</tr>
</thead>
</table>

Range  The minimum width of the format is $2 + (\text{length of shift code used on the current DBCSTYPE= setting})^2$

Restriction The width must be an even number. If it is an odd number, it is truncated. The width must be equal to or greater than the length of the shift-code data.

Details
The $KANJI$ format adds shift-code data to DBCS data that does not have shift-code data. If the input data is blank, shift-code data is not added.

The $KANJI$ format processes host-mainframe data, but $KANJI$ can be used on other platforms. If you use the $KANJI$ format on non-EBCDIC (non-modal encoding) hosts, the data does not change.
$KANJIXw. Format

Removes shift-code data from DBCS data.

Category: DBCS
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$KANJIXw.

Syntax Description

w specifies the width of the output field.

Range  The minimum width of the format is 2.
Restriction  The width must be an even number. If it is an odd number, it is truncated. The width must be equal to or greater than the length of the shift-code data.

Details

The $KANJIX format removes shift-code data from DBCS data. The input data length must be 2 + (SO/SI length)*2. The data must start with SO and end with SI, unless single-byte data is returned.

The $KANJIX format processes host mainframe data, but $KANJIX can be used on other platforms. If you use the $KANJIX format on non-EBCDIC (non-modal encoding) hosts, the data does not change.
$LOGVSw. Format

Processes a character string that is in left-to-right-logical order, and then writes the character string in visual order.

Category: BIDI Text Handling
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$LOGVSw.

Syntax Description

\( w \)

specifies the width of the output field.

Default 200
Range 1–32767

Details

The $LOGVSw. format is used when you store logical-ordered text on a visual server.

Note: If the $LOGVSw. format is not accessible, then the Hebrew or Arabic portion of the data is reversed.
Comparisons

The $LOGVS_w. format performs processing that is the opposite of the $LOGVSR_w. format.

Example

The following example uses the Hebrew input value of "flight".

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $logvs12.;</td>
<td>י&quot;ע ט&quot;נ flight</td>
</tr>
</tbody>
</table>

The following example uses the Arabic input value of "computer".

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $logvs12.;</td>
<td>ذا&quot;ت computer</td>
</tr>
</tbody>
</table>

$LOGVSRw. Format

Processes a character string that is in right-to-left-logical order, and then writes the character string in visual order.

Category: BIDI Text Handling
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

$LOGVSRw.

Syntax Description

w specifies the width of the output field.

Default 200

Range 1–32767

Details

The $LOGVSRw. format is used when you store logical-ordered text on a visual server. The Hebrew or Arabic portion of the text is reversed if the $LOGVSw. format is not on the server.

Comparisons

The $LOGVSRw. format performs processing that is opposite of the $LOGVSw. format.

Example

The following example uses the Hebrew input value of "_flight".

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $logvar12.;</td>
<td>flight מטפ</td>

MINGUOw. Format

Writes date values as Taiwanese dates in the form yyyymmdd.

Category: Date and Time
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

MINGUOw.

Syntax Description

w

specifies the width of the output field.

Default 8
Range 1–10

Details

The MINGUOw. format writes SAS date values in the form yyyymmdd, where

yyyy

is an integer that represents the year.

mm

is an integer that represents the month.

dd

is an integer that represents the day of the month.

The Taiwanese calendar uses 1912 as the base year (01/01/01 is January 1, 1912). Dates before 1912 appear as a series of asterisks. Year values do not roll around after 100 years. Instead, they continue to increase.

Example

The example table uses the following input values:

- 12054 is the SAS date value that corresponds to January 1, 1993.
- 18993 is the SAS date value that corresponds to January 1, 2012.
- -20088 is the SAS date value that corresponds to January 1, 1905.
<table>
<thead>

---

**NENGOw. Format**

*W*rites date values as Japanese dates in the form *e.yymmd*.

**Category:** Date and Time

**Alignment:** Left

**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Syntax**

`NENGOw.`
Syntax Description

\texttt{w}

specifies the width of the output field.

Default \hspace{1cm} 10

Range \hspace{1cm} 2–10

Details

The NENGO\texttt{w.} format writes SAS date values in the form \texttt{e.yymmdd}, where

\texttt{e}

is the first letter of the name of the imperial era (Meiji, Taisho, Showa, Heisei, or Reiwa).

\texttt{yy}

is an integer that represents the year.

\texttt{mm}

is an integer that represents the month.

\texttt{dd}

is an integer that represents the day of the month.

If the width is too small, SAS omits the period.

Example

The example table uses the input value of 15342, which is the SAS date value that corresponds to January 2, 2002.

\begin{verbatim}
data _null_;  
  date=15342;  
  put date nengo3.;  
  put date nengo6.;  
  put date nengo8.;  
  put date nengo9.;  
  put date nengo10.;  
  run;
\end{verbatim}

\begin{verbatim}
H14
H14/01
H.140102
H14/01/02
H.14/01/02
\end{verbatim}

- “NENGO\texttt{w.} Informat” on page 545
NLBESTw. Format

Writes the best numerical notation based on the locale.

Categories: CAS
           Numeric

Alignment: Right

Syntax

NLBESTw.

Syntax Description

w

specifies the width of the output field.

Default  12

Range    1–32

Tip      If you print numbers between 0 and .01 exclusively, then use a field width of at least 7 to avoid excessive rounding. If you print numbers between 0 and -.01 exclusively, use a field width of at least 8.

Details

The NLBEST format writes the best numerical value based on the locale's decimal point and the sign mark's location. NLBEST is similar to the BEST format. For more information, see the BEST format in the SAS Formats and Informats: Reference.

Example

The following code produces results based on the locale:

options locale=English_UnitedStates;
data test;
  x=-1257000;
  put x nlbest6.;
  put x nlbest3.;
  put "=====
  x=-0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====
  x=0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====
  x=1257000;
  put x nlbest6.;
options locale=German_Germany;
data test;
  x=-1257000;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
  x=-0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
  x=0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
  x=1257000;
  put x nlbest6.;
  put x nlbest3.;
run;

options locale=ar_BH;
data test;
  x=-1257000;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
  x=-0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
  x=0.1;
  put x nlbest6.;
  put x nlbest3.;
  put "=====";
run;

put x nlbest3.;
run;
NLDATENV. Format

Converts a SAS date value to the date value of the specified locale, and then writes the date value as a date.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATENVw.

Syntax Description

w specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 20
Range 10–200

Comparisons

NLDATENVw. is similar to DATEw. and WORDDATEw. except that NLDATENVw. is locale-specific.
Example

These examples use the input value of 15760, which is the SAS date value that corresponds to February 24, 2003. The first example specifies the English United States locale. The second example specifies the German Germany locale.

```sas
options locale=English_UnitedStates;
data test;
  day=15760;
  put day nldate.;
run;
```

February 24, 2003

```sas
options locale=German_Germany;
data test;
  day=15760;
  put day nldate.;
run;
```

24. Februar 2003

**NLDATELw. Format**

Converts a SAS date value to the date string of the specified locale, and then writes the date value as a date in the form month, date, year.

Categories: CAS Date and Time

Alignment: Left

**Syntax**

```
NLDATELw.
```

**Syntax Description**

`w`

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.
Details

NLDATEL writes the date in a long-uniform pattern with the full length of the month and week names.

Example

This example uses the date November 19, 2012.

```sas
data _null_;
  dt = dt='19Nov2012:00:00:00'dt;
  dy='19Nov2012'd;
  put "+--- NLDATEL min=2 default=18 max=200 ----+";
  put dy nldatel.;
  put dy nldatel10.;
  put dy nldatel12.;
  put dy nldatel18.;
  put dy nldatel200.;
run;
```

```
+--- NLDATEL min=2 default=18 max=200 ----+
November 19, 2012
11/19/2012
Nov 19, 2012
November 19, 2012
```

**NLDATEMw. Format**

Converts a SAS date value to the date string of the specified locale, and then writes the date value as a date in a medium-uniform pattern.

<table>

</thead>
</table>

**Syntax**

```
NLDATEMw
```

**Syntax Description**

- `w` specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.
Details

NLDATEM writes the date in a medium-uniform pattern such as Nov 19, 2012.

Example

This example specifies the date Nov 19, 2012.

```sas
data _null_;  
dt='19Nov2012:00:00:00'dt;  
dy='19Nov2012'd;  
put '+'--- NLDATEM min=2 default=14 max=200 ---+';  
put dy nldatem.;  
put dy nldatem8.;  
put dy nldatem14.;  
put dy nldatem200.;  
run;
```

+--- NLDATEM min=2 default=14 max=200 ---+
Nov 19, 2012  
11/19/12  
Nov 19, 2012  
Nov 19, 2012

--- NLDAT...
Example

This example specifies the english_United States locale option.

```sas
option locale=en_US;
data _null_;   	dy = date();   
put dy nldatemd.;   
run;
```

11/19/2012
11/19/2012
```

--- NLDATEWw. Format

Converts a SAS date value to the date value of the specified locale, and then writes the value as the date and the day of the week.

Categories:
- CAS
- Date and Time

Alignment:
- Left

Syntax

**NLDATEWw.**

Syntax Description

`w` specifies the width of the output field. If necessary, SAS abbreviates the date and the day of the week to fit the format width.

<table>
<thead>
<tr>
<th>Default</th>
<th>29</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>10–200</td>
</tr>
</tbody>
</table>
Details
The NLDATEnW format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths on page 85 for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Comparisons
NLDATEnWw. is similar to WEEKDATEw. except that NLDATEnWw. is locale specific.

Example
These examples use the input value of 15760, which is the SAS date value that corresponds to February 24, 2003. The first example specifies the en_US locale. The second example specifies the de_DE locale.

```sas
options locale=en_US;
data _null_;  dy=15760;  put dy nldatew.;  put dy nldatew20.;  put dy nldatew200.;  run;
Monday, February 24, 2003
Mon, Feb 24, 2003
Monday, February 24, 2003
```

```sas
options locale=de_DE;
data _null_;  dy=15760;  put dy nldatew.;  put dy nldatew20.;  put dy nldatew200.;  run;
Mo., 24. Feb 2003
Mo., 24. Feb 2003
Montag, 24. Februar 2003
```

NLDATEWNw. Format

Converts the SAS date value to the date value of the specified locale, and then writes the date value as the day of the week.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

NLDATEWNw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the day of the week to fit the format width.

Default 9

Range 4–200

Comparisons

NLDATEWNw. is similar to DOWNAMEw. except that NLDATEWNw. is locale-specific.

Example

These examples use the input value of 15760, which is the SAS date value that corresponds to February 24, 2003. The first example specifies the en_US locale. The second example specifies the de_DE locale.

```sas
options locale=en_US;
data _null_;   dy=15760;   put dy nldatewn.; run;

Monday

options locale=de_DE;
data _null_;   dy=15760;   put dy nldatewn10.; run;

Montag
```
NLDATEYWMw. Format

Converts the SAS date value to the date value of the specified locale, and then writes the date value as the year and the name of the month.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATEYWMw.

Syntax Description

w

specifies the width of the output field.

Default 16
Range 6–200

Details

If you specify a width of 6, but your data is larger than 6, your output contains asterisks: d=*****. To remove the asterisks, you can use PROC LOCALEDATA. The following example uses PROC LOCALEDATA to write the date without the asterisks:

PROC LOCALEDATA;
LOAD SASLOCALE;
MODIFY key=DATE_YYMM_SHORT_FORMAT value='%b %y' ;
SAVE REGISTRY / _ALL_ syntax=SAS;

data _null_;  
format d nldateym6.;
d = '17OCT14'd ;
put d=;
run;

d=Oct 14
Example

This example specifies the spanish_Spain locale option. This example specifies the date of April 4, 2019.

```sas
options locale=spanish_Spain;
data _null_;  
dy=today();  
put dy nldateym.;  
put dy nldateym12.;  
put dy nldateym200.;  
run;
```

NLDATEYQMw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year and the year’s quarter value (Q1–Q4) using abbreviations.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATEYQMw.

Syntax Description

w
specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 7

Range 4–200
Details

NLDATEYQM writes the date in a medium-uniform pattern with abbreviations for the year and year’s quarter value, such as Q2 2019.

Example

The following example uses the date April 4, 2019.

```sas
data _null_;
  dt = datetime();
  dy = date();
  put '++++ NLDATEYQM min=4 default=7 max=200 +++';
  put dy nldateyqm.;
  put dy nldateyqm6.;
  put dy nldateyqm7.;
  put dy nldateyqm200.;
run;
```

```
++++ NLDATEYQM min=4 default=7 max=200 +++
Q2 2019
2019/2
Q2 2019
Q2 2019
```

NLDATEYQSw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year and the year’s quarter value (1–4) with numbers and delimiters.

Categories: CAS
          Date and Time

Alignment: Left

Syntax

`NLDATEYQSw.`

Syntax Description

`w`

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 6

Range 4–200
Details
NLDATEYQS writes the date in a short-uniform pattern with numbers and delimiters for the year and year’s quarter value, such as 2019/2.

Example
The following example specifies the date April 4, 2019.

```sas
data _null_;
  dt = datetime();
  dy = date();
  put '+--- NLDATEYQS min=4 default=6 max=200 ---+';
  put dy nldateyqs.;
  put dy nldateyqs4.;
  put dy nldateyqs6.;
  put dy nldateyqs200.;
run;
```

```
+--- NLDATEYQS min=4 default=6 max=200 ---+
2019/2
19/2
2019/2
2019/2
```

NLDATEYRw. Format
Converts the SAS date value to the date value of the specified locale, and then writes the date value as the year.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

**NLDATEYRw.**

Syntax Description

`w`
- specifies the width of the output field.

Default 16
- Range 2–200

Example
This example specifies the fr_FR locale option. This example specifies the date April 4, 2019.
NLDATEYWw. Format

Converts the SAS date value to the date value of the specified locale, and then writes the date value as the year and the week.

Categories:       CAS             Date and Time

Alignment:       Left

Syntax

NLDATEYWw.

Syntax Description

w

specifies the width of the output field.

Default  16

Range    5–200

Example

This example specifies the date April 4, 2019. This example specifies the fr_FR locale option.

```sas
options locale=fr_FR;
data _null_;  
dt = datetime();  
dy = date();  
put '+--- NLDATEYR min=4 default=6 max=200 ---+';  
put dy nldateyr.;  
put dy nldateyr2.;  
put dy nldateyr8.;  
put dy nldateyr200.;  
run;

+--- NLDATEYR min=4 default=6 max=200 ---+
 2019
 19
 2019
 2019
```

```sas
options locale=fr_FR;
data _null_;  
dt = datetime();  
dy = date();  
put '+--- NLDATEYW min=5 default=16 max=200 ---+';  
put ' 16' +5 dy nldateyw.;  
put ' 5' +5 dy nldateyw5.;
```
NLDATMw. Format

Converts a SAS datetime value to the datetime value of the specified locale, and then writes the value as a datetime.

**Syntax**

\[ \text{NLDATM}w. \]

**Syntax Description**

- \( w \): specifies the width of the output field. If necessary, SAS abbreviates the datetime value to fit the format width.

  - **Default**: 30
  - **Range**: 10–200

**Comparisons**

The NLDATMw. format is similar to the DATETIMEw. format except that the NLDATMw. format is locale-specific.

**Example**

These examples specify the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003. The first example specifies the en_US locale. The second example specifies the de_DE locale.

```sas
options locale=en_US;
data _null_;  dy=1361709583;  put dy nldatm.;
```
run;

options locale=de_DE;
data _null_
   dy=1361709583;
   put dy nl.datm.;
run;

NLDATMAPw. Format

Converts a SAS datetime value to the datetime value of the specified locale, and then writes the value as a datetime with a.m. or p.m.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMAPw.

Syntax Description

w
  specifies the width of the output field. If necessary, SAS abbreviates the datetime value to fit the format width.

  Default 32
  Range 16–200

Comparisons

The NLDATMAPw. format is similar to DATEAMPMw. except that the NLDATMAPw. format is locale-specific.
Example

These examples specify the input value of 1361709583, which is the SAS date-time value that corresponds to 12:39:43 p.m. on February 24, 2003. The first example specifies the en_US locale. The second example specifies the es_MX locale.

```sas
options locale=en_US;
data _null_;
dy=1361709583;
put dy nldatmap.;
run;
```

February 24, 2003 12:39:43 PM

```sas
options locale=es_MX;
data _null_;
dy=1361709583;
put dy nldatmap200.;
run;
```

24 de febrero de 2003 12:39:43 p.m.

NLDATMLw. Format

Converts a SAS datetime value to the datetime string of the specified locale in the long representation of the date.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMLw.
Syntax Description

\[ w \]

\[ w \]

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default: 30

Range: 9–200

Details

NLDATML writes the date in a long-uniform pattern with the full length of the month, date, year, and time, such as April 10, 2019 03:13:27 PM.

Example

```sas
data _null_
  dt = datetime();
  dy = date();
  put "*--- NLDATML min=9 default=30 max=200 ----*"
  dt nldatml.;
  put dt nldatml19.;
  put dt nldatml24.;
  put dt nldatml30.;
  put dt nldatml200.;
run;
```

```plaintext

<td>April 12</td>
</tr>
</tbody>
</table>

NLDATMMDMw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the month and day of the month using abbreviations.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Left

**Syntax**

```
NLDATMMDMw.
```

**Syntax Description**

- `w` specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

**Default**

| 9 |

**Range**

| 5–200 |
NLDATMMMDM writes the date in a medium-uniform pattern with abbreviations of the month and the day, such as Nov 19.

Example

The following example uses the date of April 12, 2019.

```sas
data _null_;
  dt = datetime();
  dy = date();
  put '+--- NLDATMMMDM min=5 default=9 max=200 ----';
  put dt nldatmmmdm.;
  put dt nldatmmmdm5.;
  put dt nldatmmmdm9.;
  put dt nldatmmmdm200.;
run;
```

```
+--- NLDATMMMDM min=5 default=9 max=200 ----
Apr 12
04/12
Apr 12
Apr 12
```

NLDATMMMDSw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the month and day of the month using numbers and delimiters.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

```
NLDATMMMDSw.
```

Syntax Description

- `w`
  - specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

  Default: 5
  Range: 5–200
Details

NLDATMMDS writes the date in a short-uniform pattern with numbers and delimiters of the month and the day, such as 4/12.

Example

The following example uses the date of April 12, 2019.

```sas
data _null_
  dt = datetime();
  dy = date();
  put '+--- NLDATMMDS min=5 default=5 max=200 ---+';
  put dt nldatmmds.;
  put dt nldatmmds5.;
  put dt nldatmmds5.;
  put dt nldatmmds200.;
run;
```

```

April
Apr
April
April

NLDATMSw. Format

Converts a SAS datetime value to the datetime string of the specified locale in the short representation of
the date.

Categories: CAS
            Date and Time
Alignment:  Left

Syntax

    NLDATMSw.

Syntax Description

    \text{w}

\text{w} specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

    Default  19
    Range    9–200

Details

NLDATMS writes the date in a short-uniform pattern with number and delimiters, such as MM/DD/YYYY hh:mm:ss.

Example

This example uses the date April 12, 2019.

    data _null_;
NLDATMTMw. Format

Converts the time portion of a SAS datetime value to the time-of-day value of the specified locale, and then writes the value as a time of day.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

**NLDATMTMw.**

Syntax Description

**w**

specifies the width of the output field.

Default 16

Range 16–200

Comparisons

The NLDATMTMw. format is similar to the TODw. format except that the NLDATMTMw. format is locale-specific.

Example

These examples use the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003.

This example specifies the English_United_States locale.

```plaintext
options locale=en_US;
data one;
```
This example specifies the German_Germany locale.

```sas
options locale=en_US;
data one;
  event=1361709583;
  put event nldatmtm.;
run;
```

12.39 Uhr

---

**NLDATMTZw. Format**

Converts the time portion of the SAS datetime value to the time of day and time zone of the specified locale.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Left

**Syntax**

`NLDATMTZw.`

**Syntax Description**

`w`

- specifies the width of the output field.

**Default**

32

**Range**

16–200
Example

This example uses the current datetime value. This example specifies the French_France locale.

```sas
options locale=fr_FR;
data test;
x=datetime();
   put x=nldatmtz.;
run;
```

NLDATMWW. Format

Converts SAS datetime values to the locale sensitive datetime string as the day of the week and the datetime.

Categories:
- CAS
- Date and Time

Alignment: Left

Syntax

```
NLDATMWW.
```

Syntax Description

`w`

Specifies the width of the output field. If necessary, SAS abbreviates the day of week and datetime to fit the format width.

Default 41

Range 16–200

Details

The NLDATMWW format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths on page 85 for information about recommended widths for locale and encoding combinations. You might need to use the suggested width for the NLDATMWW format.

Comparisons

The NLDATMWW. format is similar to the TWMDYw. format except that the NLDATMWW. format is locale-specific.
Example

This example uses the input value of 1361709583, which is the SAS datetime value that corresponds to 12:39:43 p.m. on February 24, 2003. This example specifies the English_United States locale.

```sas
options locale=English_UnitedStates;
data one;
x=put(1361709583,nldatmw.);

**Categories:** CAS
Date and Time

**Alignment:** Left

**Syntax**

`NLDATMYMSw.`

**Syntax Description**

`w`

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

**Default**  7

**Range**  5–200

**Details**

`NLDATMYMS` writes the date in a short-uniform pattern with numbers and a delimiter for the month and year, such as 11/2012.

**Example**

The following example uses the date April 16, 2019.

```sas
data _null_;  
dt = datetime();  
dy = date();  
put '+--- NLDATMYMS min=5 default=7 max=200 ----+';  
put dt nldatmyms.;  
put dt nldatmyms5.;  
put dt nldatmyms7.;  
put dt nldatmyms200.;  
run;
```
NLDATMYQw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the quarter and the year.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMYQw.

Syntax Description

w

specifies the width of the output field.

Default 16

Range 4–200

Details

The NLDATMYQ format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths on page 85 for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Example

This example uses the en_US locale option.

```sas
options locale=en_US;
data _null_;  
  dy=today();  
  dt=datetime();  
  put "---- NLDATMYQS min=4 default=16 max=200 ----+";  
  put ' 16' +5 dt nldatmyq.;  
  put '  4' +5 dt nldatmyq4.;  
  put ' 14' +5 dt nldatmyq14.;  
  put ' 32' +5 dt nldatmyq32.;  
  put '200' +5 dt nldatmyq200.;
```

Chapter 10 / Dictionary of Formats for NLS

**Alignment:** Left

**Syntax**

```
NLDATMYQLw.
```

**Syntax Description**

- `w` specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

  **Default** 18  
  **Range** 4–200

**Details**

`NLDATMYQL` writes the date in a long uniform pattern in full length of the year’s quarter and then the year, such as 4th quarter 2012.

**Example**

The following example uses the date of April 16, 2019. This example specifies the `en_US` locale.

```sas
options locale=en_US;

data _null_;  
dt = datetime();  
dy = date();  
put '++++  NLDATMYQLR min=4 default=16 max=200 +++';  
put dt nldatmyql6.;  
put dt nldatmyql7.;
```
NLDATMYQMw. Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year’s quarter (1–4) and then the year.

Categories: CAS

Number: Date and Time

Alignment: Left

Syntax

NLDATMYQMw.

Syntax Description

w

specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>4–200</td>
</tr>
</tbody>
</table>

Details

NLDATMYQM writes the date in a medium-uniform pattern of the year’s quarter and then the year, such as Q2 2019.

Example

The following example uses the date of April 16, 2019.

```sas
data _null_
  dt = datetime()
  dy = date()
  put '+--- NLDATMYQM min=4 default=7 max=200 ---+';
  put dt nldatmyqm.;
  put dt nldatmyqm6.;
  put dt nldatmyqm7.;
  put dt nldatmyqm200.;
```
NLDATMYQS_ Format

Converts a SAS date value to the date string of the specified locale, and then writes the date value as the year and the quarter (1-4) using numbers and a delimiter.

Categories:
CAS
Date and Time

Alignment:
Left

Syntax

NLDATMYQS_w.

Syntax Description

w
specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

Default 6
Range 4–200

Details

NLDATMYQS writes the date in a short-uniform pattern of the year and year’s quarter value using numbers and a delimiter, such as 2012/4.

Example

The following example uses the date April 16, 2019.

data _null_
  dt = datetime();
  dy = date();
  put '---- NLDATMYQS min=4 default=6 max=200 ----';
  put dt nldatmyqs.;
  put dt nldatmyqs4.;
  put dt nldatmyqs6.;
  put dt nldatmyqs200.;
run;
NLDATMYRw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the year.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLDATMYRw.

Syntax Description

w

specifies the width of the output field.

Default 16
Range 2–200

Example

This example uses the en_US locale option, which is the default SAS session encoding.

```sas
data _null_
  dt = datetime();
  dy = date();
  put '---- NLDATMYR min=2 default=16 max=200 ----+';
  put dt nldatmyr.;
  put dt nldatmyr2.;
  put dt nldatmyr32.;
  put dt nldatmyr200.;
run;
```

```
---- NLDATMYR min=2 default=16 max=200 ----+
2019
19
2019
2019
```
NLDATMYWw. Format

Converts the SAS datetime value to the datetime value of the specified locale, and then writes the value as the week number and the year.

Categories: CAS
Date and Time

Alignment: Left

Syntax

\texttt{NLDATMYWw.}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default 16

Range 5–200

Example

This example uses the en\_US locale option, which is the default SAS session encoding.

```
data _null_;  
  dt = datetime();  
  dy = date();  
  put '+'--- NLDATMYW min=5 default=16 max=200 ---+'';  
  put '16' +5 dt nldatmyw.;  
  put ' 5' +5 dt nldatmyw5.;  
  put ' 8' +5 dt nldatmyw8.;  
  put '32' +5 dt nldatmyw32.;  
  put '200' +5 dt nldatmyw200.;  
run;
```

--- NLDATMYW min=5 default=16 max=200 ---+
16 Week 16 2019
5 *****
8 W16 19
32 Week 16 2019
200 Week 16 2019
NLDATMZW Format

Converts SAS datetime values to the locale-sensitive datetime string as datetime and time zone.

Categories:
- CAS
  - Date and Time

Alignment: Left

Syntax

NLDATMZWw.

Syntax Description

w
  specifies the width of the output field.

Default: 40

Range: 16–200

Example

This example uses the current datetime value. This example specifies the fr_FR locale.

```
options locale=fr_FR;
data test;
x=datetime();
put x=nldatmz.;
run;
```

x=16 avril 2019 11 h 40 -0400

NLMNIAEDw.d Format

 Writes the monetary format of the international expression for the United Arab Emirates.

Categories:
- CAS
  - Numeric

Alignment: Left

Syntax

NLMNIAEDw.d
Syntax Description

**w**
specifies the width of the output field.

- Default: 12
- Range: 8–32

**d**
specifies the number of digits to the right of the decimal point in the numeric value.

- Default: 3
- Range: 0–28

Example

In the following example, the LOCALE= system option is set to English_UnitedStates.

```plaintext
x=put(-1234.56789,nlmniaed32.2);
y=put(-1234.56789,dollar32.2);
```

\end{itemize}

\textbf{NLMNLRUBw.d Format}

Writes the monetary format of the local expression for Russia.

Categories: CAS
Numeric
Alignment: Left

Syntax

\texttt{NLMNL\texttt{RUB}w.d}

Syntax Description

\texttt{w}
specifies the width of the output field.

Default 12
Range 8–32

\texttt{d}
specifies the number of digits to the right of the decimal point in the numeric value.

Default 2
Range 0–28

Example

In the following example, the \texttt{LOCALE=} system option is set to English_UnitedStates.

\begin{verbatim}
x = put(-1234.56789,nlmnlrub32.2);
y = put(-1234.56789,dollar32.2);
\end{verbatim}

\begin{tabular}{|l|l|}
\hline
\textbf{Statements} & \textbf{Results} \\
\hline
put x=; & (RUB1,234.57) \\
put y=; & $-1,234.57$ \\
\hline
\end{tabular}

\textbf{Format:}

- "NLMNIZARw.d Format" on page 238

\textbf{NLMNYw.d Format}

Writes the monetary format of the local expression in the specified locale using local currency.
NLMNYw.d Format

Syntax

\texttt{NLMNYw.d}

Syntax Description

\textit{w}

specifies the width of the output field.

Default \hspace{0.5cm} 9

Range \hspace{0.5cm} 1-32

\textit{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Default \hspace{0.5cm} 0

Range \hspace{0.5cm} 0-31

Details

The NLMNYw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLMNYw.d format writes numeric values by using the currency symbol, the thousands separator, and the decimal separator that is used by the locale.

\textbf{Note:} The NLMNYw.d format does not convert currency format. Therefore, the value of the formatted number should equal the currency of the current locale value.

Comparisons

The NLMNYw.d and NLMNYIw.d formats write the monetary format with locale-dependent thousands and decimal separators. However, the NLMNYIw.d format uses three-letter international currency codes, such as USD, while NLMNYw.d format uses local currency symbols, such as $.

The NLMNYw.d format is similar to the DOLLARw.d format except that the NLMNYw.d format is locale-specific.

Example

In the following example, the \texttt{LOCALE= English UnitedStates}.

\begin{verbatim}
x=put (-1234.56789, nlmny32.2);
y=put (-1234.56789, dollar32.2);
\end{verbatim}
Statements | Results
---|---
put x=; | ($1,234.57)
put y=; | $-1,234.57

NLMNYIw.d Format

Writes the monetary format of the international expression in the specified locale.

Categories: CAS
Numeric

Alignment: Left

Syntax

\texttt{NLMNYIw.d}

Syntax Description

\textit{w}

specifies the width of the output field.

Default 9
Range 1–32

\textit{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Default 0
Range 0–31
Details

The NLMNYIw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLMNYIw.d format writes numeric values by using the international currency code, and locale-dependent thousands and decimal separators. The position of international currency code is also locale dependent.

**Note:** The NLMNYIw.d format does not convert currency format. Therefore, the value of the formatted number should equal the currency of the current locale value.

Comparisons

The NLMNYw.d and NLMNYIw.d formats write the monetary format with locale-dependent thousands and decimal separators. However, the NLMNYIw.d format uses three-letter international currency codes, such as USD, while NLMNYw.d format uses local currency symbols, such as $.

Example

In the following example, the LOCALE= system option is set to English_UnitedStates.

```
x=put(-1234.56789,nlmnyi32.2);
y=put(-1234.56789,nlmny32.2);
z=put(-1234.56789,dollar32.2);
```

<table>
<thead>
<tr>

NLNUMw.d Format

Writes the numeric format of the local expression in the specified locale.

Categories:
- CAS
- Numeric

Alignment: Left

Syntax

NLNUMw.d

Syntax Description

w
specifies the width of the output field.

Default 6
Range 1–32

d
specifies to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.

Default 0
Range 0–31

Details

The NLNUMw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two’s-complement notation. The NLNUMw.d format writes numeric values by using the thousands separator and the decimal separator that is used by the locale.

Comparisons

The NLNUMw.d format writes the numeric value with locale-dependent thousand and decimal separators. The NLNUMIw.d format writes the numeric value with a comma (,) as thousands separator and a period (.) as a decimal separator.

If the \(w\) or \(d\) values are not large enough to generate a formatted number, the NLNUMw.d format uses an algorithm that prints the thousands-separator characters whenever possible, even if some decimal precision is lost.

Example

\[ x=\text{put}(-1234356.7891,\text{nlnum}32.2); \]
### NLNUMIw.d Format

**Statements**

**NLNUMIw.d Format**

Writes the numeric format of the international expression in the specified locale.

**Syntax**

```plaintext
NLNUMIw.d
```

**Syntax Description**

- **w**  
  Specifies the width of the output field.
  
  **Default**  6
  **Range**  1–32

- **d**  
  Specifies to divide the number by $10^d$. If the data contains decimal points, the $d$ value is ignored.
  
  **Default**  0
Details
The NLNUMIw.d informat reads integer binary (fixed-point) values, including negative values that are represented in two's-complement notation. The NLNUMIw.d format writes numeric values by using a comma (,) as thousands separator and a period (.) as a decimal separator for all locales.

Comparisons
The NLNUMIw.d format writes the numeric data of the international expression in the specified locale. The NLNUMIw.d format writes the numeric value with a comma (,) as thousands separator and a period (.) as a decimal separator.

If the w or d values are not large enough to generate a formatted number, the NLNUMw.d format uses an algorithm that prints the thousands-separator characters whenever possible, even if some decimal precision is lost.

Example
\[ x=\text{put}(-1234356.7891,\text{nlnumi32.2}); \]

NLPCTw.d Format
Writes percentage data of the local expression in the specified locale.
Syntax

**NLPCT\_w.d**

**Syntax Description**

\(w\)

- Specifies the width of the output field.

  Default: 6

  Range: 4–32

\(d\)

- Specifies to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.

  Default: 0

  Range: 0–31

**Comparisons**

The **NLPCT\_w.d** format writes percentage data of the local expression in the specified locale. The **NLPCT\_w.d** format writes the percentage value with locale-dependent thousand and decimal separators. The **NLPCTI\_w.d** format writes the percentage value with a comma (,) as thousands separator and a period (.) as a decimal separator.

The **NLPCT\_w.d** format is similar to the **PERCENT\_w.d** format except the **NLPCT\_w.d** format is locale-specific.

**Example**

```plaintext
x=put(-12.3456789,nlpct32.2);
y=put(-12.3456789,nlpciti32.2);
z=put(-12.3456789,percent32.2);
```

NLPCTNWw.d Format

Produces percentages, using a minus sign for negative values.

Categories: CAS, Numeric

Alignment: Right

Syntax

NLPCTNWw.d
Syntax Description

**w**

specifies the width of the output field.

- **Default**: 6
- **Range**: 4–32
- **Tip**: The width of the output field must account for the minus sign (−), the percent sign (%), and a trailing blank, whether the number is negative or positive.

**d**

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional.

- **Default**: 0
- **Range**: 0–31
- **Requirement**: must be less than **w**

Details

The NLPCTNw.d format multiplies negative values by 100, adds a minus sign to the beginning of the value, and adds a percent sign (%) to the end of the formatted value.

Example

```
x=-0.02;
```

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x nlpctn6.;</td>
<td>x=-2%</td>
</tr>
<tr>
<td>put x percentn6.;</td>
<td>x=-2%</td>
</tr>
</tbody>
</table>

NLPCTPw.d Format

Writes locale-specific numeric values as percentages.

- **Categories**: CAS, Numeric
- **Alignment**: Right
Syntax

\texttt{NLPCTPw.d}

Syntax Description

\texttt{w}

specifies the width of the output field.

- Default: 6
- Range: 4–32
- Tip: The width of the output field must account for the percent sign (\%).

\texttt{d}

specifies the number of digits to the right of the decimal point in the numeric value. This argument is optional. The thousands separator and decimal symbol for the NLPCTP format is locale-specific.

- Default: 0
- Range: 0–31
- Requirement: must be less than \texttt{w}

Details

The NLPCTP\texttt{w.d} format multiplies values by 100, formats them, and adds a percent sign (\%) to the end of the formatted value. The NLPCTP\texttt{w.d} format is similar to the PERCENT\texttt{w.d} format except that the thousands separator and decimal symbol for the NLPCTP\texttt{w.d} format is locale-specific.

Example

\begin{verbatim}
x=-0.02;
\end{verbatim}

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put x nlpctp6.;</td>
<td>\texttt{-2%}</td>
</tr>
<tr>
<td>put x percent6.;</td>
<td>\texttt{( 2%)}</td>
</tr>
</tbody>
</table>

\textbf{NLPVALUEw.d Format}

Writes p-values of the local expression in the specified locale.

- Categories: CAS, Numeric
- Alignment: Left
Syntax

**NLPVALUE**\(w.d\)

**Syntax Description**

\(w\)

specifies the width of the output field.

Default: 6

Range: 3–32

\(d\)

specifies to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.

Default: 4

Range: 1–30

**Example**

This example uses the german_Germany locale option.

**Statements:**

```sas
options locale=german_germany;
data _null_;
  put "+--- nlpvalue min=3 default=6 max=32 ---+";
  x=0.1248;
  put x= +5 x pvalue. +5 x nlpvalue.;
  put x= +5 x pvalue3.1 +5 x nlpvalue3.1;
  put x= +5 x pvalue20.2 +5 x nlpvalue20.2;
  put x= +5 x pvalue32.3 +5 x nlpvalue32.3;
run;
```

**Results:**

```
+--- nlpvalue min=3 default=6 max=32 ---+
 x=0.1248   0.1248     0,1248
 x=0.1248   0.1     0,1
 x=0.1248                   0.12                     0,12
 x=0.1248                              0.125                           0,125
```

**See Also**

**Format:**

- "PVALUEw.d Format" in *SAS Formats and Informats: Reference*
NLSTRMONw.d Format

Writes the month name in the specified locale.

Categories:  
CAS
Numeric

Alignment:  
Left

Syntax

NLSTRMONw.d

Syntax Description

w  
specifies the width of the output field

Default 20
Range 1-200

d  
specifies the following:

- 00000001: write abbreviated form.
- 00000010: write capitalized form.

Default 0
Range 0-3

Details

The NLSTRMONw.d format writes a SAS value, 1–12 as the name-of-the-month in the specified locale. The following examples use the English_UnitedStates locale.

- 1 = the first month (January)
- 2 = the second month (February)
- 3 = the third month (March)
- 4 = the fourth month (April)
- 5 = the fifth month (May)
- 6 = the sixth month (June)
- 7 = the seventh month (July)
- 8 = the eight month (August)
- 9 = the ninth month (September)
- 10 = the 10th month (October)
11 = the 11th month (November)
12 = the 12th month (December)

Example
This example uses the English_UnitedStates session encoding.

NLSTRQTRw.d Format

Writes a numeric value as the quarter-of-the-year in the specified locale.

Categories: CAS Numeric
Alignment: Left

Syntax

NLSTRQTRw.d

Syntax Description

w
specifies the width of the output field

Default 20
Range 1–200

d
specifies the following:
- 00000001: write abbreviated form.
- 00000010: write capitalized form.
The NLSTRQTRw.d format writes a SAS value, 1–4 as the name-of-the-quarter for the year in the specified locale. The following examples use the English_UnitedStates locale.

- 1 = 1st quarter
- 2 = 2nd quarter
- 3 = 3rd quarter
- 4 = 4th quarter

Example

This example uses the English_UnitedStates session encoding.

NLSTRWKw.d Format

Writes a numeric value as the day-of-the-week in the specified locale.

Categories: CAS
Numeric

Alignment: Left

Syntax

**NLSTRWKw.d**
Syntax Description

$w$

specifies the width of the output field

Default 20
Range 1–200

$d$

specifies the following:

- 00000001: write abbreviated form.
- 00000010: write capitalized form.

Default 0
Range 0–3

Details

The NLSTRWKw.d format writes a SAS value, 1–7 as the name-of-the-week in the specified locale. The following examples use the English_UnitedStates locale.

- 1 = First day-of-week (Monday)
- 2 = Second day-of-week (Tuesday)
- 3 = Third day-of-week (Wednesday)
- 4 = Fourth day-of-week (Thursday)
- 5 = Fifth day-of-week (Friday)
- 6 = Sixth day-of-week (Saturday)
- 7 = Seventh day-of-week (Sunday)

Example

This example uses the English_UnitedStates session encoding.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>wknum = 1; /* Sunday=1, Saturday=7 */</td>
<td>Sunday</td>

<td>Sun</td>
</tr>
<tr>
<td>put wknum NLSTRWK20.1; /* decimal .1 specified use abbreviation. */</td>
<td>SUNDAY</td>
</tr>
<tr>
<td>put wknum NLSTRWK20.2;</td>
<td>SUN</td>
</tr>
<tr>
<td>put wknum NLSTRWK20.3;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>
NLTIMAPw. Format

Converts a SAS time value to the time value of a specified locale, and then writes the value as a time value with a.m. or p.m. NLTIMAP also converts SAS date-time values.

Categories: CAS
Date and Time

Alignment: Left

Syntax

NLTIMAPw.

Syntax Description

w
specifies the width of the output field.

Default 10
Range 4–200

Details

The NLTIMAP format might produce inaccurate localized output when using the default width with some encoding and locale combinations because the date and time names are too long. Please refer to Exceptions for Date and Time Default Widths on page 85 for information about recommended widths for locale and encoding combinations. You might need to use the recommended width.

Comparisons

The NLTIMAPw. format is similar to the TIMEAMPMw. format except that the NLTIMAPw. format is locale-specific.

Example

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>4:24:43 PM</td>
</tr>
<tr>
<td>put time nltimap.;</td>
<td></td>
</tr>
</tbody>
</table>
**NLTIMEw. Format**

Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value. NLTIME also converts SAS date-time values.

**Categories:** CAS
Date and Time

**Alignment:** Left

**Syntax**

```plaintext
NLTIMEw.
```

**Syntax Description**

- `w` specifies the width of the input field.

  **Default**: 20

  **Range**: 10–200

**Comparisons**

The NLTIMEw. format is similar to the TIMEw. format except that the NLTIMEw. format is locale-specific.

**Example**

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=German_Germany;</td>
<td>4:24:43 nachm</td>
</tr>
<tr>
<td>put time nltimap14.;</td>
<td></td>
</tr>
</tbody>
</table>

NLTIMELw. Format

Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a long-uniform pattern.

Categories: CAS
Date and Time

Restriction: This function runs in SAS Viya 3.5 and is not supported in SAS 9.

Alignment: Left

Syntax

NLTIMELw.

Optional Argument

w
specifies the width of the input field. If necessary, SAS abbreviates the time to fit the format width.

Default 30
Range 10–200

Details

The NLTIMELw. format writes the time in a long-uniform pattern.
Examples:

Example 1

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.

data a;
options locale=English_UnitedStates;
options timezone='America/Chicago';
time=59083;
put time nltimel.;
put time nltimel10.;
put time nltimel200.;
run;

04:24:43 PM CDT
04:24 PM
04:24:43 PM CDT

Example 2

data b;
options locale=German_Germany;
options timezone='Europe/Berlin';
time=59083;
put time nltimel.;
put time nltimel10.;
put time nltimel12.;
put time nltimel18.;
put time nltimel200.;
run;

16:24:43 CEST
16:24:43
16:24:43
16:24:43 CEST
16:24:43 CEST

Example 3

data c;
options locale=English_UnitedStates;
options timezone='Etc/GMT-6';
time=59083;
put time nltimel.;
put time nltimel10.;
put time nltimel200.;
run;

04:24:43 PM GMT+6
04:24 PM
04:24:43 PM GMT+6
NLTIMEMw. Format

Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a medium-uniform pattern.

Categories:
- CAS
- Date and Time

Restriction:
This function runs in SAS Viya 3.5 and is not supported in SAS 9.

Alignment:
Left

Syntax

NLTIMEMw.

Optional Argument

w
  specifies the width of the input field. If necessary, SAS abbreviates the time to fit the format width.

  Default: 14
  Range: 10–200

Details

The NLTIMEMw. format writes the time in a medium-uniform pattern.

Example

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.

```sas
data a;
options locale=English_UnitedStates;
time=59083;
put time nltimem.;
put time nltimem10.;
put time nltimem200.;
run;
```

| 04:24:43 PM |
| 04:24 PM |
| 04:24:43 PM |

```sas
data b;
options locale=German_Germany;
time=59083;
put time nltimem.;
put time nltimem10.;
```
NLTIMESw. Format

Converts a SAS time value to the time value of the specified locale, and then writes the value as a time value in a short-uniform pattern.

Categories: CAS
Date and Time

Restriction: This function runs in SAS Viya 3.5 and is not supported in SAS 9.

Alignment: Left

Syntax

NLTIMESw.

Optional Argument

w.

specifies the width of the input field. If necessary, SAS abbreviates the time to fit the format width.

Default 11
Range 10–200

Details

The NLTIMESw. format writes the time in a short-uniform pattern.

Example

These examples use the input value of 59083, which is the SAS date-time value that corresponds to 4:24:43 p.m.

data a;
options locale=English_UnitedStates;
time=59083;
put time nltimes.;
put time nltimes10.;
put time nltimes200.;
run;

data b;
options locale=German_Germany;
time=59083;
put time nltimes.;
put time nltimes10.;
put time nltimes12.;
put time nltimes18.;
put time nltimes200.;
run;

$UCS2Bw. Format
Processes a character string that is in the encoding of the current SAS session, and then writes the character string in big-endian, 16-bit, UCS2, Unicode encoding.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax
$UCS2Bw.

Syntax Description

\texttt{w}

specifies the width of the output field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2–32767

Details
The $UCS2Bw$ format writes a character string in big-endian, 16-bit, UCS2 (universal character set code in two octets), Unicode encoding. It processes character strings that are in the encoding of the current SAS session.
Comparisons

The $UCS2Bw. format performs processing that is the opposite of the $UCS2BEw. format.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>

$UCS2BEw. Format

Processes a character string that is in big-endian, 16-bit, UCS2, Unicode encoding, and then writes the character string in the encoding of the current SAS session.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

$UCS2BEw.

Syntax Description

w
specifies the width of the output field. Specify enough width to accommodate the
16-bit size of the Unicode characters.

Default 8
Range 2–32767

Details
The $UCS2BEw. format writes a character string in the encoding of the current SAS
session. It processes character strings that are in big-endian, 16-bit, UCS2
(universal character set code in two octets), Unicode encoding.

Comparisons
The $UCS2BEw. format performs processing that is the opposite of the $UCS2Bw.
format.

Example
This example uses the Japanese Shift_JIS encoding, which is supported under the
UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x = '592700410042'x;</td>
<td>toupper</td>
</tr>
<tr>
<td>put x $ucs2be.;</td>

$UCS2Lw. Format

Processes a character string that is in the encoding of the current SAS session, and then writes the character string in little-endian, 16-bit, UCS2, Unicode encoding.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UCS2Lw.

Syntax Description

w

specifies the width of the output field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8
Range 2–32767

Details

The $UCS2Lw. format writes a character string in little-endian, 16-bit, UCS2 (universal character set code in two octets), Unicode encoding. It processes character strings that are in the encoding of the current SAS session.

Comparisons

The $UCS2Lw. format performs processing that is the opposite of the $UCS2LEw. format.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------</td>
<td>------</td>

$UCS2Xw. Format
Processes a character string that is in the encoding of the current SAS session, and then writes the character string in native-endian, 16-bit, UCS2, Unicode encoding.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

\$UCS2Xw.

Syntax Description

\( w \)

specifies the width of the output field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2–32767

Details

The \$UCS2Xw. format writes a character string in 16-bit, UCS2 (universal character set code in two octets), Unicode encoding, by using byte order that is native to the operating environment.

Comparisons

The \$UCS2Xw. format performs processing that is the opposite of the \$UCS2XEw. format. If you are exchanging data within the same operating environment, use the \$UCS2Xw. format. If you are exchanging data with a different operating environment, use the \$UCS2Bw. format or \$UCS2Lw. format.

Example

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating environment.

<table>

Range 4–32767

Details

The $\text{UCS4XEw}$ format writes a character string in the encoding of the current SAS session. It processes character strings that are in native-endian, 32-bit, UCS4 (universal character set code in four octets), Unicode encoding.
Comparisons
The $UCS4XEw. format performs processing that is the opposite of the $UCS4Xw. format.

Example
This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x = '27590000410000042000000'x; put x $ucs4be4.;</td>
<td>AB (little endian)</td>
</tr>
</tbody>
</table>

$UESCw. Format
Processes a character string that is encoded in the current SAS session, and then writes the character string in Unicode escape (UESC) representation.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UESCw.

Syntax Description

w
specifies the width of the input field.

Default 8
Details

If the characters are not available on all operating environments, for example, 0–9, a–z, A–Z, they must be represented in UESC. $UESCw. can be nested.

Comparisons

The $UESCw. format performs processing that is opposite of the $UESCEw. format.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x='';</td>
<td>¥u5927</td>
</tr>
<tr>
<td>y='u5927'</td>
<td>¥uu5927</td>
</tr>
<tr>
<td>z='uu5927';</td>
<td>¥uuu5927</td>
</tr>
<tr>
<td>put x = $uesc10.;</td>
<td></td>
</tr>
<tr>
<td>put y = $uesc10.;</td>
<td></td>
</tr>
<tr>
<td>put z = $uesc10.;</td>
<td></td>
</tr>
</tbody>
</table>

Informats:

- "$UESCw. Informat" on page 650
- "$UESCEw. Informat" on page 652

$UESCEw. Format

Processes a character string that is in Unicode escape (UESC) representation, and then writes the character string in the encoding of the current SAS session.

Category: Character

Alignment: Left

Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

\$UESCEw.

Syntax Description

\w
specifies the width of the output field.

Default 8
Range 1–32767

Details

If the data is not supported by the encoding of the current SAS session, the data remains in UESC.

Comparisons

The \$UESCEw. format performs processing that is the opposite of the \$UESCw. format.

Example

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=put('¥u5927',$uesce10.) ;</td>
<td>x=¥u5927</td>
</tr>
<tr>
<td>x=put('¥uu5927',$uesce10.) ;</td>
<td>x=¥uu5927</td>
</tr>
<tr>
<td>x=put('¥uuu5927',$uesce10.) ;</td>
<td>x=¥uuu5927</td>
</tr>
</tbody>
</table>

$UNCWw. Format

Processes a character string that is encoded in the current SAS session, and then writes the character string in numeric character representation (NCR).

**Category:** Character  
**Alignment:** Left  
**Restriction:** This format is not supported in a DATA step that runs in CAS.

**Syntax**

$UNCWw.

**Syntax Description**

\( w \)

specifies the width of the output field.

**Default** 8  
**Range** 1–32767

**Comparisons**

The $UNCWw. format performs processing that is the opposite of the $UNCREw. format.

**Example**

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
</table>
| x='91E5'x ; /* Japanese '𪤁' in Shift-JIS */  
  y='abc';  
  put x $unc10.;  
  put y $unc10.; | abc &\$22823 |

**See Also**

**Formats:**
$UNCREw. Format

Processes a character string that is in numeric character representation (NCR), and then writes the character string in the encoding of the current SAS session.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UNCREw.

Syntax Description

w
  specifies the width of the output field.

  Default  8
  Range    1–32767

Details

National characters should be represented in NCR.

Comparisons

The $UNCREw. format performs processing that is the opposite of the $UNCRw. format.

Example

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-------</td>
</tr>
<tr>
<td></td>
<td>-------</td>
</tr>
</tbody>
</table>
Statements

x='大abc';
put x $uncr10.;

Results

abc

$UPARENW. Format

Processes a character string that is encoded in the current SAS session, and then writes the character string in Unicode parenthesis (UPAREN) representation.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UPARENW.

Syntax Description

w
specifies the width of the output field.

Default 8
Range 7–32767

Details

The character string is encoded with parentheses and Unicode hexadecimal representation.

Comparisons

The $UPARENW. format performs processing that is the opposite of the $UPARENEw. format.
Example

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=' [';</td>
<td>&lt;u5927&gt;</td>
</tr>
<tr>
<td>y='abc3';</td>
<td>&lt;u0061&gt; &lt;u0062&gt; &lt;u0063&gt; &lt;u0033&gt;</td>
</tr>
<tr>
<td>put x $uparen7.;</td>
<td></td>
</tr>
<tr>
<td>put y $uparen28.;</td>

$UPARENEw. Format

Processes a character string that is in Unicode parenthesis (UPAREN), and then writes the character string in the encoding of the current SAS session.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UPARENEw.

Syntax Description

w
- specifies the width of the output field.

Default 8
Range 1–32767
Comparisons

The $UPARENEw. format performs processing that is the opposite of the $SUPARENw. format.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x = '&lt;u0061&gt;&lt;u0062&gt;&lt;u0063&gt;&lt;u0033&gt;'; put x $uparene4.;</td>

$UTF8Xw. Format

Processes a character string that is in the encoding of the current SAS session, and then writes the character string in universal transformation format (UTF-8) encoding.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UTF8Xw.

Syntax Description

w

specifies the width of the output field. Specify enough width to include all of the characters in the variable. The width of the characters is dependent on the code point value of the individual characters.
$UTF8XEw. Format

Processes a character string that is in universal transformation format (UTF-8), and then writes the character string in the encoding of the current SAS session.

Category: Character
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$UTF8XEw.
Syntax Description

w
specifies the width of the output field. Specify enough width to include all of the characters in the variable. The width of the characters is dependent on the code point value of the individual characters.

Default: 8
Range: 1–32767

Comparisons

The $UTF8XEw. format performs processing that is the opposite to the $UTF8Xw. format.

Example

This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x = unicode('u5927');</td>
<td>✮</td>
</tr>
<tr>
<td>put x $utf8xe10.;</td>

$VSLOGw. Format

Processes a character string that is in visual order, and then writes the character string in left-to-right logical order.

Category: BIDI Text Handling
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.
Syntax

$VSLOGw.$

Syntax Description

w
specifies the width of the output field.

Default 200

Range 1–32767

Details
The $VSLOGw. format is used when transferring data that is stored in visual order. An example is transferring data from a UNIX server to a Windows client.

Note: The $VSLOGw. format does not correctly process all combinations of data strings.

Comparisons
The $VSLOGw. format performs processing that is opposite to the $VSLOGRw. format.

Example
The following example uses the Hebrew input value of "טֶרַף flight".

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $vslog12.;</td>
<td>טֶרַף flight</td>
</tr>
</tbody>
</table>

The following example uses the Arabic input value of "ذات computer".

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put text $vslog12.;</td>
<td>ذات computer</td>
</tr>
</tbody>
</table>

See Also

Format:
$VSLOGRw. Format

Processes a character string that is in visual order, and then writes the character string in right-to-left logical order.

Category: BIDI Text Handling
Alignment: Left
Restriction: This format is not supported in a DATA step that runs in CAS.

Syntax

$VSLOGRw.

Syntax Description

\( w \)

specifies the width of the output field.

Default 200
Range 1–32767

Details

The $VSLOGRw. format is used when transferring data that is stored in visual order. An example is transferring data from a UNIX server to a Windows client.

Note: The $VSLOGRw. format does not correctly process all combinations of data strings.

Comparisons

The $VSLOGRw. format performs processing that is opposite to the $VSLOGw. format.

Example

The following example uses the Hebrew input value of “navbarDropdown.”
The following example uses the Arabic input value of "اللك" computer.

```
 Statements                 Results

 put text $logvs12;          flight

 put text $logvs12;          ذات computer
```

### WEEKUw. Format

**Writes a week number in decimal format by using the U algorithm.**

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Left

**Syntax**

```WEEKUw.```

**Syntax Description**

```
w
```

specifies the width of the output field.

**Default:** 11

**Range:** 2–200

Details

The WEEKUw. format writes a week-number format. The WEEKUw. format writes the various formats depending on the specified width. Algorithm U calculates the SAS date value by using the number of the week within the year (Sunday is considered the first day of the week). The number-of-the-week value is represented as a decimal number in the range 0–53, with a leading zero and maximum value of 53. For example, the fifth week of the year would be represented as 05.

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>w01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWwww</td>
<td>03W01</td>
</tr>
<tr>
<td>7-8</td>
<td>yyWwwdd</td>
<td>03W0101</td>
</tr>
<tr>
<td>9-10</td>
<td>yyyyWwwdd</td>
<td>2003W0101</td>
</tr>
<tr>
<td>11-200</td>
<td>yyyy-Www-dd</td>
<td>2003-W01-01</td>
</tr>
</tbody>
</table>

Comparisons

The WEEKVw. format writes the week number as a decimal number in the range 01–53, with weeks that begin on a Monday and week 1 of the year including both January 4 and the first Thursday of the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year. The WEEKWw. format writes the week number of the year as a decimal number in the range 00–53, with Monday as the first day of week 1. The WEEKUw. format writes the week number of the year (Sunday as the first day of the week) as a decimal number in the range 0–53, with a leading zero.

Example

sasdate = '01JAN2003'd;

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>v=put(sasdate,weeku3.);</td>
<td>W00</td>

**YENw.d Format**

Writes numeric values with yen signs, commas, and decimal points.

<table>
<thead>
<tr>
<th>Category</th>
<th>Numeric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment</td>
<td>Right</td>
</tr>
<tr>
<td>Restriction</td>
<td>This format is not supported in a DATA step that runs in CAS.</td>
</tr>
</tbody>
</table>

**Syntax**

```
YENw.d
```

**Syntax Description**

\[w\]  
specifies the width of the output field.

- **Default:** 8
- **Range:** 1–32

\[d\]  
specifies the number of digits to the right of the decimal point in the numeric value.
Details

The YENw.d format writes numeric values with a leading yen sign and with a comma that separates every three digits of each value.

The hexadecimal representation of the code for the yen sign character is 5B on EBCDIC systems and 5C on ASCII systems. The monetary character these codes represent might be different in other countries.

Example

```
put cost yen10.2;

data _null_;
    value=1254.71;
    put value yen10.2;
run;
```

<table>
<thead>
<tr>
<th>Cost</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>----+----1</td>
<td>¥1,254.71</td>
</tr>
</tbody>
</table>

### YYWEEKUw. Format

Writes a week number in decimal format by using the U algorithm, excluding day-of-the-week information.

**Categories:**
- CAS
- Date and Time

**Alignment:**
- Left

**Syntax**

```
YYWEEKUw.
```

**Syntax Description**

- \( \text{w} \)
  - specifies the width of the output field.
The YYWEEKUw. format writes a week-number format. The YYWEEKUw. format writes the various formats depending on the specified width. Algorithm U calculates the SAS date value by using the number of the week within the year (Sunday is considered the first day of the week).

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>W01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
<tr>
<td>9-above</td>
<td>invalid</td>
<td>invalid</td>
</tr>
</tbody>
</table>

The YYWEEKUw. format is similar to the WEEKUw. format except that the YYWEEKUw. format does not specify the day-of-week information. Also, the YYWEEKUw. format does not accept any width that is greater than 8.

Example

```sas
sasdate = '01JAN2007'd;
```

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>u=put(sasdate,yyweeku3.);</td>
<td>W00</td>
</tr>
<tr>
<td>v=put(sasdate,yyweeku4.);</td>
<td>W00</td>
</tr>
<tr>
<td>w=put(sasdate,yyweeku5.);</td>
<td>07W00</td>
</tr>
<tr>
<td>x=put(sasdate,yyweeku6.);</td>
<td>07W00</td>
</tr>
<tr>
<td>y=put(sasdate,yyweeku7.);</td>
<td>2007W00</td>
</tr>
<tr>
<td>z=put(sasdate,yyweeku8.);</td>
<td>2007-W00</td>
</tr>
<tr>
<td>put u;</td>
<td></td>
</tr>
<tr>
<td>put v;</td>
<td></td>
</tr>
<tr>
<td>put w;</td>
<td></td>
</tr>
<tr>
<td>put x;</td>
<td></td>
</tr>
<tr>
<td>put y;</td>
<td></td>
</tr>
<tr>
<td>put z;</td>
<td></td>
</tr>
</tbody>
</table>
YYWEEKVw. Format

Writes a week number in decimal format by using the V algorithm, excluding day-of-the-week information.

Categories: CAS
Date and Time

Alignment: Left

Syntax
YYWEEKVw.

Syntax Description
w

specifies the width of the output field.

Default 7
Range 2–8

Details
The YYWEEKVw. format writes the various formats depending on the specified width. Algorithm V calculates the SAS date value, and the number-of-the-week value is represented as a decimal number in the range 01–53, with a leading zero and maximum value of 53. Weeks begin on a Monday and week 1 of the year is the week that includes both January 4 and the first Thursday of the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year. For example, the fifth week of the year would be represented as 06.

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>www</td>
<td>w01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
</tbody>
</table>
Comparisons

The YYWEEKVw format is similar to the WEEKVw format except that the YYWEEKVw format does not specify the day-of-week information. Also, the YYWEEKVw format does not accept a width that is greater than 8.

Example

sasdate = '01JAN2007'd;

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>u=put(sasdate,yyweekv3.);</td>
<td>W01</td>
</tr>
<tr>
<td>v=put(sasdate,yyweekv4.);</td>
<td>W01</td>
</tr>
<tr>
<td>w=put(sasdate,yyweekv5.);</td>
<td>07W01</td>

YYWEEKWw. Format

Writes a week number in decimal format by using the W algorithm, excluding the day-of-week information.

Categories: CAS  
Date and Time  

Alignment: Left  

Syntax

YYWEEKWw.
Syntax Description

w
  specifies the width of the output field.

  Default  7
  Range    2–8

Details

The YYWEEKWw. format writes the various formats depending on the specified width. Algorithm W calculates the SAS date value using the number of the week within the year.

For more information about widths, formats, and examples see the following table:

<table>
<thead>
<tr>
<th>Widths</th>
<th>Formats</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-4</td>
<td>Www</td>
<td>W01</td>
</tr>
<tr>
<td>5-6</td>
<td>yyWww</td>
<td>07W01</td>
</tr>
<tr>
<td>7</td>
<td>yyyyWww</td>
<td>2007W01</td>
</tr>
<tr>
<td>8</td>
<td>yyyy-Www</td>
<td>2007-W01</td>
</tr>
<tr>
<td>9-above</td>
<td>invalid</td>
<td>invalid</td>
</tr>
</tbody>
</table>

Comparisons

The YYWEEKWw. format is similar to the WEEKWw. format except that the YYWEEKWw. format does not specify the day-of-week information. Also, the YYWEEKWw. format does not accept any width that is greater than 8.

Example

sasdate = '01JAN2007'd

Dictionary of Functions for NLS ............................................ 373
Internationalization Compatibility for SAS String Functions

SAS provides string functions and CALL routines that enable you to easily manipulate your character data. Many of the original SAS string functions assume that the size of one character is always 1 byte. This process works well for data in a single-byte character set (SBCS). However, when some of these functions and CALL routines are used with data in a double-byte character set (DBCS) or a multi-byte character set (MBCS) such as UTF-8, the data is often handled improperly, and the string functions produce incorrect results.

To solve this problem SAS introduced a set of string functions and CALL routines, called K functions, for those string manipulations where DBCS or MBCS data must be handled carefully. The K functions do not make assumptions about the size of a character in a string. Table 11.4 on page 343 shows the level of l18N compatibility for each SAS string function. l18N is the abbreviation for internationalization. Compatibility indicates whether a program using a particular string function can be adapted to different languages and locales without program changes.

It is important to understand the difference between byte-based offset-length and character-based offset-length in order to use the K functions properly.

A byte-based offset assumes that the starting position specified for a character is the byte position of that character in the string. For SBCS data, where one character is always 1 byte in length, you can assume that the second character in the string begins in byte 2. However, if the data in the string is multi-byte data, the data in byte 2 might be one of the following, depending on the data and the encoding of the data:

- the second character in the string
- the second byte of a 2-byte character
- the first byte of the first character in the string.

A byte-based length represents the number of bytes in the string.
A character-based offset assumes that the position specified is the position of the character in the string. For all encodings, a character-based position of 2 is always the second character in the string. You cannot assume that you know the size of the characters in the string.

A character-based length represents the number of characters in the string.

K functions use a character-based offset or length, which does not take into consideration the byte position of the character in the string.

Here is an example of the functionality of a SAS string function and its corresponding K function.

In the UTF8 encoding, the STR='E282AC313233'x string has 6 bytes and represents four characters.

Table 11.1  String Representation in UTF-8

<table>
<thead>
<tr>
<th>Hexadecimal Representation</th>
<th>E282AC</th>
<th>31</th>
<th>32</th>
<th>33</th>
</tr>
</thead>
<tbody>
<tr>
<td>€</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td></td>
</tr>
</tbody>
</table>

The following example uses this same hexadecimal string in the SUBSTR function, which returns an unexpected value in UTF-8. The expected returned string would be the first character, the euro symbol. However, the result is an invalid character. The LENGTH function is byte-oriented, so it reads the individual bytes of data. The SUBSTR function returns the first byte of the first character, which is an incomplete value because the first character is encoded on 3 bytes.

Table 11.2  Code Example Using Regular Functions

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>/* SAS program to submit in a UTF-8 SAS session */</td>
<td>str=E282AC313233</td>
</tr>
<tr>
<td>data <em>null</em> ;</td>
<td>s= sl=1 s=E22020202020</td>
</tr>
<tr>
<td>str= “€123” ;</td>
<td>l=6</td>
</tr>
<tr>
<td>s=substr(str,1,1) ;</td>
<td></td>
</tr>
<tr>
<td>sl=length(s) ;</td>
<td></td>
</tr>
<tr>
<td>l=length(str) ;</td>
<td></td>
</tr>
<tr>
<td>put str= $hex16. /s= sl= /s= $hex. /l=;</td>
<td></td>
</tr>
<tr>
<td>run ;</td>
<td></td>
</tr>
</tbody>
</table>

The code in Table 11.3 on page 343 solves this issue by substituting the SUBSTR() function, which works only on single-byte data, with the KSUBSTR() function, which works on single and multi-byte data. Direct substitutions can also be made for other string functions, such as changing the LENGTH() or INDEX() functions to use the KLENGTH() or KINDEX() functions. Because the two functions read the data differently, you get different results when running this code in a multi-byte environment.
Table 11.3  Code Example Using K Functions

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>/* SAS program to submit in a UTF-8 SAS session */</td>
<td></td>
</tr>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>str= “€123” ;</td>
<td></td>
</tr>
<tr>
<td>s=ksubstr(str,1,1) ;</td>
<td>s=€</td>
</tr>
<tr>
<td>s1=klength(s) ;</td>
<td>l=4</td>
</tr>
<tr>
<td>l=klength(str) ;</td>
<td></td>
</tr>
<tr>
<td>put str= $hex16. / s= / s1= / s= $hex. / l=;</td>
<td></td>
</tr>
<tr>
<td>run ;</td>
<td></td>
</tr>
</tbody>
</table>

Before replacing all of the original SAS string-handling functions with K functions, examine your SAS program. If the string function processes data that contains only single-byte characters, K functions are not necessary. For example, strings containing XML tags do not require the use of K functions. Knowing the character data that is in your SAS programs and how it is processed can save unnecessary updates to your SAS code. The processing of binary data is not supported by the string-handling K functions, which expect strings to match the current session encoding.

String functions are assigned I18N levels depending on whether the functions can process DBCS, MBCS, or SBCS. Here are descriptions of the levels:

I18N Level 0
This function is designed for SBCS data. Do not use this function to process MBCS data.

I18N Level 1
This function should be avoided, if possible, if you are processing MBCS data. The I18N Level 1 functions might not work correctly with DBCS or MBCS encodings under certain circumstances.

I18N Level 2
This function can be used for SBCS, DBCS, and MBCS (UTF-8) data.

Chapter 11 / Internationalization Compatibility for SAS String Functions
VARCHAR Support in Functions

VARCHAR Data Type in String Functions

SAS supports the VARCHAR data type for character-data processing in the DATA step and PROC step. The CAS engine is required to read or write VARCHAR data in order to preserve the variable’s type. Variables created using the VARCHAR data type vary in width and use character semantics, rather than being fixed-width and using byte semantics of the original SAS character data type. When a VARCHAR variable is passed to any string function, including the traditional string functions or the K functions, SAS assumes that the length represents the number of characters. An offset for a VARCHAR variable represents the position of a character in the string. The fixed-width character data type is better suited for binary data.

VARCHAR is supported in CAS tables and is used in a data_NULL_step. Some procedures support VARCHAR columns. Procedures that do not support VARCHAR columns convert the columns to a fixed-width character column. VARCHAR is not supported in data sets.

Here is an example of the data types using the SUBSTR function $\text{substr}(X, 10, 2)$.

If the variable $X$ is defined as a fixed-width character variable, SUBSTR returns the 10th and 11th bytes in the string. If $X$ is defined as a VARCHAR variable, SUBSTR returns the 10th and 11th characters in the string.

A variable that is assigned a VARCHAR data type of length 10 can hold up to 10 characters.

This table shows the differences between fixed-width and VARCHAR data types. The fixed-width character data type uses byte semantics and VARCHAR uses character semantics.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Traditional String Function</th>
<th>K Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed-width character</td>
<td>byte</td>
<td>character</td>
</tr>
<tr>
<td>VARCHAR</td>
<td>character</td>
<td>character</td>
</tr>
</tbody>
</table>
The SAS Viya session encoding, UTF-8, supports data that can be 1 or multiple bytes. An example of a multi-byte UTF-8 character is the euro (€) character, which has 3 bytes. Here is a table that shows the representation of the string €123. The € character has 3 bytes and each number has 1 byte.

<table>
<thead>
<tr>
<th>Character</th>
<th>€</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hexadecimal value</td>
<td>E2</td>
<td>82</td>
<td>AC</td>
<td>31</td>
</tr>
</tbody>
</table>

The following examples compare the fixed-width data type and the VARCHAR data type. *Table 12.1 on page 370* shows results from the fixed-width variable using the data €123. *Table 12.2 on page 371* shows results using VARCHAR.

K functions should be used for fixed-width character data that might contain multi-byte characters:

1. The example in the first row assigns the string to a fixed-width character column. The PUT statement displays the characters and then displays the hexadecimal value for those characters.

2. The example in the second row uses the SUBSTR function with a position of 2. Because the variable x is a fixed-width character column, the position interpreted as the second byte of the string in x, which is also the second byte of the € character. The result is that the first 2 bytes assigned to xsub are invalid UTF-8 data. The results displayed here show garbage (or the Unicode replacement character) as the first 2 bytes of xsub.

3. The example in the third row uses the INDEX function to locate the 1 in the string. Because the variable x is a fixed-width character column, the result returned by the INDEX function is the byte position of the character in the string. The result is xidx=4 because the 1 is located at the fourth byte in x.

K functions should be used for fixed-width character data that might contain multi-byte characters:

*Table 12.1 Fixed-Width Character Example*

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>x='€123';</td>
<td></td>
</tr>
<tr>
<td>put x=</td>
<td></td>
</tr>
<tr>
<td>x= $hex6.;</td>
<td></td>
</tr>
<tr>
<td>xsub=substr(x,2);</td>
<td></td>
</tr>
<tr>
<td>put xsub=</td>
<td></td>
</tr>
<tr>
<td>xsub= $hex.;</td>
<td></td>
</tr>
<tr>
<td>xidx=index(x,'1');</td>
<td></td>
</tr>
<tr>
<td>put xidx=</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

1. The example in the first row assigns the string to a VARCHAR column. The PUT statement displays the characters and then the hexadecimal value for those characters.

2. The example in the second row uses the SUBSTR function with a position of 2. In this example, the variable v is defined as a VARCHAR so that the position is
interpreted as the second character of the string in v. The result assigned to vsub is the string '123', which contains valid UTF-8 characters.

3. The example in the third row uses the INDEX function to locate the 1 in the string. Because the variable v is a VARCHAR column, the result returned by the INDEX function is the character position of the character in the string. The result is vidx=2 because 1 is the second character in v.

Table 12.2  VARCHAR Character Example

Functions by Category

Some functions run in SAS only, and some functions run in SAS and on the CAS engine. If CAS is specified for the function category, then the function runs in SAS and on the CAS server. If CAS is not specified for the function category, then the function runs in SAS only. For example, the BASECHAR function runs in SAS and on the CAS server, so CAS is specified as a category. The KCVT function runs on SAS only, so CAS is not specified as a category.

The following categories relate to NLS issues:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAS</td>
<td>Functions that run on the CAS server.</td>
</tr>
<tr>
<td>Character</td>
<td>processes character data</td>
</tr>
</tbody>
</table>
### Currency Conversion
converts one currency to another currency

### DBCS
processes double-byte character set.

### Date and Time
processes data and time data.

### Locale
processes data based on the specified locale.

### Variable Information
processes variable information.

</tbody>
</table>

### Dictionary

#### ANORM420 Function

Returns a normalized string from an input string encoded in EBCDIC420.

**Category:** Character

**Restriction:** This function is assigned an I18N Level 1 status. If possible, avoid I18N Level 1 functions if you are using a non-English language. Under certain circumstances, the I18N Level 1 functions might not work correctly with Double-Byte Character Set (DBCS) or Multi-Byte Character Set (MBCS) encodings. For more information, see Internationalization Compatibility on page 341.
Syntax

**ANORM420**( *string*, *<modifiers>* )

**Required Argument**

*string*  
specifies an input string that is encoded in EBCDIC420.

**Optional Argument**

*modifiers*  
are character constants, variables, or expressions that specify one or more modifiers. The following modifiers can be in uppercase or lowercase:

- `g`  
  ignores the ligature
- `i`  
  ignores the Arabic-Indic numbers
- `p`  
  ignores mapping of shaped characters
- `s`  
  ignores the addition of space
- `t`  
  ignores transcoding
- `z`  
  ignores mapping of the zero-length-space character

**Details**

The ANORM420 function processes data that is encoded in EBCDIC420.

Refer to the following tables for information about the modifier variables:

The ANORM420 function replaces the following character and code points with the appropriate ligature unless the modifier `g` is specified.

**Table 13.2  Modifier *g*: Arabic Ligatures**

</tr>
<tr>
<td>ن</td>
<td>0xBD</td>
<td>U+0646</td>
<td>Arabic Letter NOON</td>
</tr>
<tr>
<td>ه</td>
<td>0xBF</td>
<td>U+0647</td>
<td>Arabic Letter HEH</td>
</tr>
</tbody>
</table>
The ANORM420 function transcodes the normalized string to the session encoding unless the modifier \( t \) is specified.

The ANORM420 function remaps the zero-length-break-space character (U+200B), also abbreviated ZWSP, to a space character unless the modifier \( z \) is specified. The zero-length character is located at code position 0x45.

Example

data _null_;  
a = '59CD57BC577745'x  ;  
s1 = anorm420(a)  ;  
/* Turn off addition of space and mapping of Arabic-Indic numbers */  
s2 = anorm420(a,"si")  ;  
/* Turn off transcoding */  
s3 = anorm420(a,'t')  ;  
    put s1= $hex20. / s2= $hex20. / s3=$hex20.  ;  
run;

These statements produce these results:

\[
\begin{align*}
\text{s1} &= \text{D8A8D987D8A7D985D8A7} \\
\text{s2} &= \text{D8A8D987D8A7D985D8A7} \\
\text{s3} &= \text{58BF56BB567740404040} \\
\end{align*}
\]

CALL KSCANX Routine

Returns the position and length of the \( n \)th word from a character string.

Categories: CAS, DBCS

Notes: CALL KSCANX is designed to process multi-byte data. However, if the first argument, \textit{string}, has single-byte characters, then the CALL KSCANX routine processes the SBCS data. For more information, see “Internationalization Compatibility for SAS String Functions” on page 341.
Argument types for arguments that are updated must match in CALL routines. All argument types must be CHAR, VARCHAR, or NUMERIC. If the argument types do not match, a warning is issued to the SAS log.

Syntax

```
CALL KSCANX(<string>, count, position, length,<character-list>,<modifier(s)>);
```

Required Arguments

- **string**
  - specifies a character constant, variable, or expression.

- **count**
  - specifies a nonzero numeric constant, variable, or expression that has an integer value. The integer value specifies the number of the word in the character string that you want CALL KSCAN to select. For example, a value of 1 indicates the first word, a value of 2 indicates the second word, and so on. The following rules apply:
    - If `count` is positive, CALL KSCANX counts words from left to right in the character string.
    - If `count` is negative, CALL KSCANX counts words from right to left in the character string.

- **position**
  - specifies a numeric variable in which the position of the word is returned. If `count` exceeds the number of words in the string, then the value that is returned in `position` is 0. If `count` is 0 or missing, then the value that is returned in `position` is missing.

- **length**
  - specifies a numeric variable in which the length of the word is returned. If `count` exceeds the number of words in the string, then the value that is returned in `length` is 0. If `count` is 0 or missing, then the value that is returned in `length` is missing.

Optional Arguments

- **character-list**
  - specifies an optional character expression that initializes a list of characters. This list determines which characters are used as the delimiters that separate words. The following rules apply:
    - By default, all characters in `character-list` are used as delimiters.
    - If you specify the K modifier in the modifier argument, then all characters that are not in `character-list` are used as delimiters.

  **TIP** You can add more characters to `character-list` by using other modifiers.

- **modifier(s)**
  - specifies a character constant, variable, or expression in which each non-blank character modifies the actions of the CALL KSCANX. Blanks are ignored. Use the following characters as modifiers:
a or A adds alphabetic characters to the list of characters.
b or B scans backward, from right to left instead of from left to right, regardless of the sign of the count argument.
c or C adds control characters to the list of characters.
d or D adds digits to the list of characters.
f or F adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
g or G adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.
h or H adds a horizontal tab to the list of characters.
i or I ignores the case of the characters.
k or K treats all characters that are not in the list of characters as delimiters. That is, if K is specified, then characters that are in the list of characters are kept in the returned value rather than being omitted because they are delimiters. If K is not specified, then all characters that are in the list of characters are treated as delimiters.
l or L adds lowercase letters to the list of characters.
m or M specifies that multiple consecutive delimiters and delimiters at the beginning or end of the string argument refer to words that have a length of 0. If the M modifier is not specified, then multiple consecutive delimiters are treated as one delimiter, and delimiters at the beginning or end of the string argument are ignored.
n or N adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
o or O processes the character-list and modifier arguments only once, rather than every time the CALL KSCANX routine is called. Using the O modifier in the DATA step can make CALL KSCANX run faster when you call it in a loop where the character-list and modifier arguments do not change. The O modifier applies separately to each instance of the CALL KSCANX routine in your SAS code. It does not cause all instances of the CALL KSCANX routine to use the same delimiters and modifiers.
p or P adds punctuation marks to the list of characters.
q or Q ignores delimiters that are inside substrings that are enclosed in quotation marks. If the value of the string argument contains unmatched quotation marks, then scanning from left to right produces different words than scanning from right to left.
s or S adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).
t or T trims trailing blanks from the string and character-list arguments. If you want to remove trailing blanks from just one character argument instead of both character arguments, then use the TRIM function instead of the CALL KSCANX routine with the T modifier.
u or U adds uppercase letters to the list of characters.
w or W adds printable (writable) characters to the list of characters.
x or X adds hexadecimal characters to the list of characters.

**TIP** If the modifier argument is a character constant, then enclose it in quotation marks. Specify multiple modifiers in a single set of quotation marks. A modifier argument can also be expressed as a character variable or expression.

Details

Definition of Delimiter and Word

A *delimiter* is any of several characters that are used to separate words. You can specify the delimiters in the *character-list* and *modifier* arguments.

In the CALL KSCANX routine, a word refers to a substring that has all of the following characteristics:

- is bounded on the left by a delimiter or the beginning of the string.
- is bounded on the right by a delimiter or the end of the string.
- contains no delimiters.

A word can have a length of 0 if there are delimiters at the beginning or end of the string or if the string contains two or more consecutive delimiters. However, the CALL KSCANX routine ignores words that have a length of 0 unless you specify the M modifier.

Using Default Delimiters in ASCII and EBCDIC Environments

If you use the CALL KSCANX routine with only four arguments, then the default delimiters depend on whether your computer uses ASCII or EBCDIC characters.

- If your computer uses ASCII characters, then the default delimiters are: blank ! $ % & ( ) * + , - . / ; < ^
- In ASCII environments that do not contain the ^ character, the CALL KSCANX routine uses the ~ character instead.
- If your computer uses EBCDIC characters, then the default delimiters are as follows: blank ! $ % & ( ) * + , - . / ; < ¬ | ¢

If you use the modifier argument without specifying any characters as delimiters, then the only delimiters used are those that are defined by the modifier argument. In this case, the lists of default delimiters for ASCII and EBCDIC environments are not used. In other words, modifiers add to the list of delimiters that are explicitly specified by the *character-list* argument. Modifiers do not add to the list of default modifiers.

Using the CALL KSCANX Routine with the M Modifier

If you specify the M modifier, then the number of words in a string is defined as one plus the number of delimiters in the string. However, if you specify the Q modifier, delimiters that are inside quotation marks are ignored.
If you specify the M modifier, the CALL KSCANX routine returns a positive position and a length of 0 if one of the following conditions is true:

- The string begins with a delimiter and you request the first word.
- The string ends with a delimiter and you request the last word.
- The string contains two consecutive delimiters and you request the word that is between the two delimiters.

If you specify a count that is greater in absolute value than the number of words in the string, then the CALL KSCANX routine returns a position and length of 0.

Using the CALL KSCANX Routine without the M Modifier

If you do not specify the M modifier, then the number of words in a string is defined as the number of maximal substrings of consecutive non-delimiters. However, if you specify the Q modifier, delimiters that are inside quotation marks are ignored.

If you do not specify the M modifier, then the CALL KSCANX routine does the following:

- ignores delimiters at the beginning or end of the string.
- treats two or more consecutive delimiters as if they were a single delimiter.

If the string contains no characters other than delimiters or if you specify a count that is greater in absolute value than the number of words in the string, then the CALL KSCANX routine returns a position and length of 0.

Finding a Designated Word as a Character String

To find a designated word as a character string after calling the CALL KSCANX routine, use the SUBSTRN function with the string, position, and length arguments:

\[ \text{ksubstr(string, position, length);} \]

Using Null Arguments

The CALL KSCANX routine allows character arguments to be null. Null arguments are treated as character strings with a length of 0. Numeric arguments cannot be null.

Example

This example uses Chinese characters:
These statements produce these results:

```
pos=17  len=3
```

---

**BASECHAR Function**

Converts characters to base characters.

**Categories:** CAS
Character

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

**Syntax**

```
STR=BASECHAR(<instr>,<Unicode type>)
```

**Required Arguments**

- **str**
  data string that is converted.

- **instr**
  input data string.

**Unicode type**

If one of the following Unicode character formats is specified, national characters are represented in the specified format:

- ESC  Unicode Escape (\u00cd).
Details
The BASECHAR function reads characters and converts them to base characters. Some characters consist of a base character and one or more accents or combining characters. The BASECHAR function reads the characters in the string and converts them to the base character form without the accents based on Unicode specifications. When Unicode type is specified, national characters are represented in the specified format. For example, the data string Mühlenseß is converted to Muhlenfließ.

Example
The SAS session encoding for this example is wlatin1.

Note: The BASECHAR function uses Unicode character decomposition mappings, so the sharp s, ß, does not have a Unicode decomposition. http://www.unicode.org/reports/tr44/#Character_Decomposition_Mappings

data cities;
  length name$24 name_ascii$24;
  input name;
  name_ascii = basechar(name);
  put name_ascii=;
datalines;
Mühlenfließ
LaUña
ZielonaGóra
run;

These statements produce these results:

name_ascii=Muhlenfließ
name_ascii=LaUna
name_ascii=ZielonaGora

The session encoding for this example is wlatin1 and the ESC option is specified.

data cities;
  length name$24 name_ascii$80;
  input name;
  name_ascii = basechar(name, "ESC");
  put name_ascii=;
datalines;
Mühlenfließ
LaUña
ZielonaGóra
run;

These statements produce these results:
The session encoding for this example is wlatin1 and the NCR option is specified.

data cities;
  length name$24 name_ascii$80;
  input name;
  name_ascii = basechar(name, "NCR");
  put name_ascii=;
datalines;
Mühlenfließ
LaÚña
ZielonaGóra
run;

These statements produce these results:

ENCODCOMPAT Function

Verifies the transcoding compatibility between two encodings.

Category: Encoding

Syntax

ENCODCOMPAT(source1,<source2>)

Required Arguments

source1
  a character string that represents an encoding.

source2
  a character string that represents an encoding. This argument is optional.

Details

If you specify one encoding, the function verifies the compatibility of the specified encoding with the current SAS session encoding.

If you specify two encodings, the function verifies the compatibility of the two encodings.

The function compares two encoding identifiers and determines whether the data needs to be transcoded. Source1 is the source encoding. Source2 is the destination encoding. Transcoding 7-bit ASCII to another type of ASCII is compatible, but transcoding ASCII to 7-bit ASCII might not be compatible.
The ENCODCOMPAT function specifies the following values:

-1 \textit{Source1} is not a valid encoding name.
-2 \textit{Source2} is not a valid encoding name.
0 The encodings are not compatible. Transcoding is needed.
1 The encodings are compatible. Transcoding is not needed.
2 A newline character is detected.

Example

The session encoding for these examples is UTF-8.

\begin{verbatim}
data encoding;
   isCompat= EncodCompat('xyz');
   put isCompat=;
run;
\end{verbatim}

These statements produce this result:

\begin{verbatim}
isCompat=-1
\end{verbatim}

\begin{verbatim}
data encoding;
   isCompat= EncodCompat ('ascii');
   put isCompat=;
run;
\end{verbatim}

These statements produce this result:

\begin{verbatim}
isCompat=1
\end{verbatim}

\begin{verbatim}
data encoding;
   isCompat= EncodCompat
   ("ebcdic1149","open_ed-1149");
   put isCompat=;
run;
\end{verbatim}

These statements produce this result:

\begin{verbatim}
isCompat=2
\end{verbatim}

\begin{verbatim}
data encoding;
   isCompat= EncodCompat ('cp1251','ebcdic1149');
   put isCompat=;
run;
\end{verbatim}

These statements produce this result:

\begin{verbatim}
isCompat=0;
\end{verbatim}

This code compares the Windows encoding \texttt{cp1251}, also known as \texttt{WLATIN2}, with \texttt{open_ed-1149}, Iceland OpenEdition EBCDIC.

\begin{verbatim}
data encoding;
   isCompat= EncodCompat ('cp1251','open_ed-11479');
\end{verbatim}
ENCODISVALID Function

Verifies a valid encoding name.

Category: Encoding

Syntax

ENCODISVALID(source)

Required Argument

source

a character string that represents an encoding name.

Details

The ENCODISVALID function returns the following values:

- 0  the character string is not a valid encoding name.
- 1  the character string is a valid short encoding name.
- 2  the character string is a valid long encoding name.
- 3  the character string is a valid alias encoding name.

Example

data valid;
  isValid1=EncodIsValid('xyz');
  isValid2=EncodIsValid('wlt2');
  isValid3=EncodIsValid('wlatin2');
  isValid4=EncodIsValid('cp1250');
  put isValid1=;
  put isValid2=;
  put isValid3=;
  put isValid4;
run;

These statements produce these results:
GETLOCENV Function

Returns the current locale/language environment.

Category: Locale

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

GETLOCENV()

Details

The GETLOCENV function returns the locale/language environment value for a valid SAS locale. The following environment values are possible:

SBCS
The SAS session encoding is SBCS (Single-Byte Character Set). SASWZSD is loaded for string manipulation.

DBCS
The SAS session encoding is DBCS (Double-Byte Character Set). SASWZSD is loaded for string manipulation.

MBCS
The SAS session encoding is Unicode(UTF8). SASWZSU is loaded for string manipulation.

If you receive a blank value, then the WZSS subsystem is not available. This action suggests a configuration or installation error.

Example

```
Data test;
  option locale=french_france;
  environ=getlocenv();
  put environ=;
run;
```

These statements produce this result:

```
environ=MBCS
```
GETPXLANGUAGE Function

Returns the current two-letter language code.

Category: Locale

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

GETPXLANGUAGE()

Details

The GETPXLANGUAGE function returns the two-letter language code based on the current value of the LOCALE= SAS system option. The length of the language name is two characters. If the size of the variable that receives the value is less than two characters, the value is truncated.

Example

In the first example, the LOCALE= system option is set to French_France. The second example is set to German. The third example is set to English_United States.

System Options:
GETPXLOCALE Function

Returns the POSIX locale value for a SAS locale.

Category: Locale

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

GETPXLOCALE(<source>)

Required Argument

<source> is an optional argument that specifies a locale name.

Details

The GETPXLOCALE function returns the POSIX locale value for a valid SAS locale name. If you specify an invalid locale name, then a null string is returned. If you do not specify a value for the <source> argument, then the function returns the POSIX name for the current SAS session. The length of the POSIX locale name is five characters. If the size of the variable that receives the value is less than five characters, the value is truncated.

Example

In the first example, the LOCALE= system option is set to French_France. In the second example, the <source> argument is set to German_Germany. In the third example, the <source> argument is set to English_United States.

<table>

<td>fr_FR</td>
</tr>
</tbody>
</table>
locale=getpxLocale("german_germany");              de_DE
put locale;

locale=getpxLocale("english_unitedstates");        en_US
put locale;

See Also

System Options:
- “LOCALE System Option” on page 696

Functions:
- “GETPXLANGUAGE Function” on page 396
- “GETPXREGION Function” on page 398

GETPXREGION Function

Returns the current two-letter region code.

Category: Locale

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

GETPXREGION()  

Details

The GETPXREGION function returns the two-letter region code based on the current LOCALE= SAS system option. The length of the region name is two characters. If the size of the variable that receives the value is less than two characters, the value is truncated.

Example

In this example, the LOCALE system option is set to French_France.

data test;
option locale=french_france;
    region=getpxRegion();
    put region;
run;
These statements produce this result:

```plaintext
FR
```

In this example, the LOCALE system option is set to German.

```plaintext
data test;
  option locale=german;
  region=getpxRegion();
  put region;
run;
```

These statements produce this result:

```plaintext
DE
```

In this example, the LOCALE system option is set to English_United States.

```plaintext
data test;
  option locale=en_US;
  region=getpxRegion();
  put region;
run;
```

These statements produce this result:

```plaintext
US
```

---

**KCHARLIST Function**

Returns the character list according to the modifier.

- **Categories**: CAS, DBCS
- **Restriction**: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

\[ \text{str} = \text{KCHARLIST}(\text{modifier}) \]

Required Argument

\textit{modifier}

specifies a character constant, variable, or expression in which each non-blank character modifies the action of the KCHARLIST function. Use the following characters as modifiers:

- A or a returns alphabetic characters.
- C or c returns control characters.
- D or d returns digital characters.
- For f returns the first characters in SAS names.
- G or g returns graphic characters.
- L or l returns lowercase characters.
- P or p returns punctuation characters.
- S or s returns all space characters.
- U or u returns uppercase characters.
- X or x returns hexadecimal characters.

Details

KCHARLIST returns encoding-specific characters that can be used with other K functions. Using KCHARLIST to determine the delimiters helps to avoid the ambiguity of the delimiters in SAS string functions.

KCHARLIST can return DBCS space and punctuation character lists.

Example

This example uses KCHARLIST and KSCAN to process a string with a DBCS space and an SBCS space.

```
data _null_;  
  string = "北京 赛仕 软件"; /*1*/  
  result1 = KSCAN(string, 2); /*2*/  
  put result1=; /*3*/  
  result2 = KSCAN(string, 2, KCHARLIST('S')); /*4*/  
  put result2=; /*5*/  
run;  
```

1 Assign a value with a DBCS space and an SBCS space to the variable \textit{string}. The input string contain two spaces. The first space is a DBCS space, and the second space is an SBCS space.

2 KSCAN selects the second word, but KSCAN ignores DBCS spaces, so 软件 is selected.

3 The value 软件 is written to the output.

4 KCHARLIST processes the DBCS spaces and passes the space list to KSCAN as delimiters. The correct value 赛仕 is selected.
The value 賽仕 is written to the output.

result1=軟件
result2=賽仕

KCOMPARE Function

Returns the result of a comparison of character expressions.

Categories: CAS
            DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: Non-DBCS equivalent function is the “COMPARE Function” in SAS Functions and CALL Routines: Reference.

Syntax

KCOMPARE(source,<pos, count, > findstr,<modifiers>)

Required Arguments

source
    specifies the character expression to be compared.

findstr
    specifies the character expression to compare to source.

Optional Arguments

pos
    specifies the starting position in source to begin the comparison. If pos is omitted, the entire source is compared. If pos is less than 0, source is assumed as extended DBCS data that does not contain any SO/SI characters.

modifiers
    i or I  ignores the case in source and findstr.
    l or L  removes leading blanks in source and findstr before comparing the values.
    n or N  removes quotation marks from any argument that is a literal name and ignores the case of source and findstr. A literal name is a
name token that is expressed as a string within quotation marks, followed by the uppercase or lowercase letter n. Literal names enable you to use special characters (including blanks), which are not allowed in SAS data sets or variable names. For KCOMPARE to recognize a string as a literal name, the first character must be a quotation mark.

: (colon) truncates the longer string in source or findstr to the length of the shorter string, whichever is greater. If ‘:’ modifier is not specified, then use the longer string length, and the shorter one will be padded with blanks at the end of the string.

count specifies the number of bytes to compare. If count is omitted, all of source that follows pos is compared, except for any trailing blanks.

Details
The order in which the modifiers appear in the COMPARE function is relevant.

- LN first removes leading blanks from each string, and then it removes quotation marks from name literals.
- NL first removes quotation marks from name literals, and then it removes leading blanks from each string.

KCOMPARE returns values as follows:
- a negative value if source is less than findstr
- 0 if source is equal to findstr
- a positive value if source is greater than findstr

Example
The following example uses Japanese characters.

```sas
options pages=1 nodate ls=80 ps=60;

data test;
  rc1 = kcompare(‘漢字のテスト’, ‘漢字’);
  rc2 = kcompare(‘漢字のテスト’, 7，’テスト’);
  rc3 = kcompare(‘漢字のテスト’, 1, 6, ’漢字’);
  rc4 = kcompare(‘漢字のテスト’, ‘ABC’);
  rc5 = kcompare(‘ABCDEF’, ‘ABC’);
run;

proc print data=test; run;
```

The SAS System

<table>

<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>
KCOMPRESS Function

Removes specified characters from a character expression.

Categories:
- CAS
- DBCS

Restriction:
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip:
Non-DBCS equivalent function is COMPRESS in SAS Functions and CALL Routines: Reference.

Syntax

\[ \text{KCOMPRESS}(\text{source}, \langle \text{characters-to-remove} \rangle, \langle \text{modifier(s)} \rangle) \]

Required Argument

\textbf{source}

specifies a character expression that contains the characters to be removed. When only source is specified, KCOMPRESS returns this expression with all of the single and double-byte blanks removed.

Optional Arguments

\textbf{characters-to-remove}

specifies the character or characters that KCOMPRESS removes from the character. If characters-to-remove is omitted, KCOMPRESS removes all blank expressions.

Tip
Enclose a literal string of characters in quotation marks.

\textbf{modifier}

specifies a character constant, variable, or expression in which each non-blank character modifies the action of the KCOMPRESS function. Full-width alphabetic and numeric characters are supported. Blanks are ignored. The following characters can be used as modifiers:

- \text{a or A} adds alphabetic characters to the list of characters. English characters and full-width alphabetic and numeric characters are supported.
- \text{c or C} adds control characters to the list of characters.
- \text{d or D} adds numeric characters (or digits) to the list of characters. English characters and full-width alphabetic and numeric characters are supported.
- \text{f or F} adds the underscore character and English characters to the list of characters. Only English characters are supported.
- \text{g or G} adds graphic characters to the list of characters.
h or H adds a horizontal tab to the list of characters.
i or I ignores the case of the characters and full-width characters to be kept or removed.
k or K keeps the characters in the list instead of removing them.
l or L adds lowercase characters to the list of characters. English characters and full-width alphabetic and numeric characters are supported.
n or N adds numeric characters, the underscore character, and English characters to the list of characters. Only English characters are supported.
o or O uses the O modifier in the DATA step (excluding WHERE clauses) or the SQL procedure to make KCOMPRESS run much faster when it is called in a loop, where the second and third arguments do not change.
p or P adds punctuation marks to the list of characters.
s or S removes all Unicode space characters in a Unicode SAS session.
t or T trims trailing blanks from the first and second arguments. Only English characters are supported.
u or U adds uppercase characters to the list of characters. English characters and full-width alphabetic and numeric characters are supported.
w or W adds printable characters to the list of characters.
x or X adds hexadecimal characters to the list of characters.

**TIP** If the *modifier* is a constant, enclose it in quotation marks. Specify multiple constants in a single set of quotation marks. *Modifier* can also be expressed as a variable or an expression.

### Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>result=kcompress('漢字のテスト','の');</td>
<td>result=漢字テスト</td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

### See Also

**Functions:**

- "KLEFT Function" on page 428
KCOUNT Function

Returns the number of double-byte characters in an expression.

Categories: CAS DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

```
KCOUNT(source)
```

Required Argument

`source` specifies the character expression to count.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

Example

The following examples use Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>result=3</td>
</tr>
<tr>
<td>text='abcあいう';</td>
<td></td>
</tr>
<tr>
<td>result=kcount(text);</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
<tr>
<td>data casuser.encodcompat;</td>
<td>result=3</td>
</tr>
<tr>
<td>text='abcあいう';</td>
<td></td>
</tr>
<tr>
<td>result=kcount(text);</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>
KCOUNTC Function

Counts individual characters in a character string.

Categories: CAS
              DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8).

Syntax

\[ \text{KCOUNTC}(\text{string}, \text{character-list}, \langle \text{modifier(s)} \rangle); \]

Required Arguments

\textit{string}

specifies a character constant, variable, or expression in which characters are counted.

\textbf{TIP} Enclose a literal string of characters in quotation marks.

\textit{character-list}

specifies a character constant, variable, or expression that initializes a list of characters. The KCOUNTC function counts characters in this list, provided that you do not specify the V modifier in the modifier argument. If you specify the V modifier, then all characters that are not in this list are counted. You can add more characters to the list by using other modifiers.

\textbf{TIP} Enclose a literal string of characters in quotation marks.

If there are no characters in the list after processing the modifiers, the KCOUNTC function returns a 0.

Optional Argument

\textit{modifier(s)}

specifies a character constant, variable, or expression in which each non-blank character modifies the actions of the KCOUNTC function. Blanks are ignored. The following characters, in uppercase or lowercase, can be used as modifiers:

- \texttt{blank} is ignored.
- \texttt{a} or \texttt{A} adds alphabetic characters to the list of characters.
- \texttt{b} or \texttt{B} scans \textit{string} from right to left instead of from left to right.
- \texttt{c} or \texttt{C} adds control characters to the list of characters.
- \texttt{d} or \texttt{D} adds digits to the list of characters.
f or F adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.

g or G adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.

h or H adds a horizontal tab to the list of characters.

i or I ignores the case of the characters.

l or L adds lowercase letters to the list of characters.

n or N adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.

o or O processes the character-list and modifier arguments only once, at the first call to this instance of the KCOUNTC function. If you change the value of character-list or modifier in subsequent calls, the change might be ignored by the KCOUNTC function.

p or P adds punctuation marks to the list of characters.

s or S adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).

t or T trims trailing blanks from the string and character-list arguments. If you want to remove trailing blanks from just one character argument instead of both character arguments, then use the TRIM function instead of the KCOUNT routine with the T modifier.

u or U adds uppercase letters to the list of characters.

v or V counts characters that do not appear in the list of characters. If you do not specify this modifier, then the KCOUNTC function counts characters that do appear in the list of characters.

w or W adds printable (writable) characters to the list of characters.

x or X adds hexadecimal characters to the list of characters.

TIP If modifier is a constant, enclose it in quotation marks. Specify multiple constants in a single set of quotation marks.

Details

The Basics

The KCOUNTC function allows character arguments to be null. Null arguments are treated as character strings with a length of zero. If there are no characters in the list of characters to be counted, the KCOUNTC function returns a zero.

Comparisons

The KCOUNTC function counts individual characters in a character string, whereas the KCOUNTX function counts substrings of characters in a character string.
Example

This example uses Chinese characters:

```sas
data _null_
xyz='SAS是全球最大的软件公司之一，是全球商业智能和分析软件与服务领袖。'
howmanythis=kcountw(xyz, '软件'); /* Count '款' and '件' occurrence */
put howmanythis =;
run;
```

KCOUNTW Function

Counts the number of words in a character string.

Categories: CAS DBCS

Restriction: This function is assigned an I18N Level 2 status and is designed for DBCS data. However, if the first argument, `string`, has single-byte characters, then the KCOUNTW function processes the SBCS data. For more information, see “Internationalization Compatibility for SAS String Functions” on page 341.

Syntax

```
KCOUNTW(<string>,<character-list>,<modifier(s)>
```

Optional Arguments

`string`

specifies a character constant, variable, or expression in which words are counted.

`character-list`

specifies an optional character constant, variable, or expression that initializes a list of characters. The characters in this list are delimiters that separate words. However, if you specify the K modifier in the `modifier` argument, then all characters, including the characters in the list, are treated as delimiters. To add more characters to the list, use other modifiers. `Delimiter` refers to any of several characters that you can specify to separate words.

**TIP** Character arguments can be null. Null arguments are treated as character strings with a length of zero. Numeric arguments cannot be null.

`modifier`

specifies a character constant, variable, or expression in which each non-blank character modifies the actions of the KCOUNTW function. The following characters can be used as modifiers:
blank is ignored.
a or A adds alphabetic characters to the list of characters.
b or B counts from right to left instead of from left to right. Right-to-left counting makes a difference only when you use the Q modifier and the string contains unbalanced quotation marks.
c or C adds control characters to the list of characters.
d or D adds digits to the list of characters.
f or F adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
g or G adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.
h or H adds a horizontal tab to the list of characters.
i or I ignores the case of the characters.
k or K treats all characters that are not in the list as delimiters. If K is not specified, all characters that are in the list are treated as delimiters.
l or L adds lowercase letters to the list of characters.
m or M specifies that multiple consecutive delimiters and delimiters at the beginning or end of the string argument refer to words that have a length of zero. If the M modifier is not specified, multiple consecutive delimiters are treated as one delimiter, and delimiters at the beginning or end of the string argument are ignored.
n or N adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
o or O processes the character-list and modifier arguments only once rather than every time the KCOUNTW function is called. Using the O modifier in the DATA step (excluding WHERE clauses) or in the SQL procedure can make the KCOUNTW function run faster when you call it in a loop where chars and modifier arguments do not change.
p or P adds punctuation marks to the list of characters.
q or Q ignores delimiters that are inside substrings that are enclosed in quotation marks. If the value of string contains unmatched quotation marks, scanning from left to right produces different words than scanning from right to left.
s or S adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).
t or T trims trailing blanks from the string and character-list arguments.
u or U adds uppercase letters to the list of characters.
w or W adds printable (writable) characters to the list of characters.
x or X adds hexadecimal characters to the list of characters.
Details

Definition of Word

In the KCOUNTW function, word refers to a substring that has one of these characteristics:

- is bounded on the left by a delimiter or the beginning of the string.
- is bounded on the right by a delimiter or the end of the string.
- contains no delimiters, except if you use the Q modifier and the delimiters are within substrings that have quotation marks.

Using the KCOUNTW Function in ASCII and EBCDIC Environments

If you use the KCOUNTW function with only two arguments, the default delimiters are different depending on whether your computer uses ASCII or EBCDIC characters.

- If your computer uses ASCII characters, here are the default delimiters: blank ! $ % & ( ) * + , - . / ; < ^ | .
  
  In ASCII environments that do not contain the ^ character, the SCAN function uses the ~ character instead.

- If your computer uses EBCDIC characters, here are the default delimiters: blank ! $ % & ( ) * + , - . / ; < ¬ | ¢

Using the M Modifier

If you do not use the M modifier, then a word must contain at least one character. If you use the M modifier, then a word can have a length of zero. In the latter case, the number of words is one plus the number of delimiters in the string, not the number of delimiters inside strings that are enclosed in quotation marks when you use the Q modifier.

Example

This example uses Chinese characters:

```
data null;
xyz='SAS是全球最大的软件公司之一，是全球商业智能和分析软件与服务领袖。';
howmanythis=kcountw(xyz, ' ', 'p'); /* Count words, use punctuations as delimiter. */
put howmanythis = ;
run;
```

KCOUNTX Function

Counts the number of times that a specified substring appears within a character string.

Categories:

- CAS
- DBCS
Restriction: This function is assigned an I18N Level 2 status and is designed for DBCS data. However, if the first argument, string, has single-byte characters, then the KCOUNTX function processes the SBCS data. For more information, see “Internationalization Compatibility for SAS String Functions” on page 341.

Syntax

\[
\text{KCOUNTX}(\text{string}, \text{substring}, <\text{modifier(s)}>);
\]

Required Arguments

**string**

specifies a character constant, variable, or expression in which substrings are counted.

TIP Enclose a literal string of characters in quotation marks.

**substring**

is a character constant, variable, or expression that specifies the substring of characters to count in **string**.

TIP Enclose a literal string of characters in quotation marks.

Optional Argument

**modifier**

is a character constant, variable, or expression that specifies one or more modifiers. The following modifiers can be in uppercase or lowercase:

i ignores character case during the count. If this modifier is not specified, the KCOUNTX function counts only character substrings with the same case as the characters in **substring**.

t trims trailing blanks from **string** and **substring**.

TIP If **modifier** is a constant, enclose it in quotation marks. Specify multiple constants in a single set of quotation marks. **Modifier** can also be expressed as a variable or as an expression.

Details

Basics

The KCOUNTX function searches **string**, from left to right, for the number of occurrences of the specified **substring** and returns that number of occurrences. If the substring is not found in string, the KCOUNTX function returns a value of 0.

CAUTION
If two occurrences of the specified substring overlap in the string, the result is undefined. For example, `kcount('boobooobo', 'boobo')` might return either a 1 or a 2.

Example
This example uses Chinese characters:

```plaintext
data _null_;
xyz='SAS是全球最大的软件公司之一，是全球商业智能和分析软件与服务领袖。';
howmanythis=kcount(xyz, '软件'); /* Count '软件' occurrence */
put howmanythis = ;
run;
```

howmanythis=2

KCVT Function
Converts data from one type of encoding data to another type of encoding data.

Categories: CAS
Character

Restriction: This function is assigned an I18N Level 1 status. If possible, avoid I18N Level 1 functions if you are using a non-English language. Under certain circumstances, the I18N Level 1 functions might not work correctly with Double-Byte Character Set (DBCS) or Multi-Byte Character Set (MBCS) encodings. For more information, see Internationalization Compatibility on page 341.

Syntax

`KCVT(text, intype, outtype, <options,...>)`

Required Arguments

- `text` specifies the character variable to be converted.
- `intype` specifies the encoding of the data. The encoding of the text must match the input data's encoding. For valid values, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.
  - ASCIIANY and EBCDICANY are invalid encoding values.
- `outtype` specifies the encoding to be converted into character data. For valid values, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.
  - ASCIIANY and EBCDICANY are invalid encoding values.
options
specifies character data options. Here are the available options:

- **NOSOSI | NOSHIFT**
  No shift code or Hankaku characters.

- **INPLACE**
  Replaces character data by conversion. The INPLACE option is specified to secure the same location between different hosts whose lengths of character data are not identical. For example, the INPLACE option converts data from the host that requires Shift-Codes into the other host, which does not require Shift Codes. Truncation occurs when the length of the character data that is converted into `outtype` for Shift-Codes is longer than the length that is specified in `intype`.

- **KANA**
  Includes Hankaku katakana characters in columns of character data.

- **UPCASE**
  Converts a 2-byte alphabet to uppercase characters.

- **LOWCASE**
  Converts a 2-byte alphabet to lowercase characters.

- **KATA2HIRA**
  Converts katakana data to hiragana.

- **HIRA2KATA**
  Converts hiragana data to katakana.

Details
See "Internationalization Compatibility for SAS String Functions" on page 341 for restrictions and more information.

The KCVT function converts SBCS, DBCS, and MBCS character strings into encoding data. For example, the KCVT function can convert the following: ASCII code data to UCS2 encoding data, Greek code data to UTF-8, and Japanese SJIS code data to another Japanese code data. You can specify the following types for the `intype` and `outtype` options: UCS2, UCS2L, UCS2B, and UTF8. To enable the DBCS mode, specify the DBCS option in the configuration file or from the command line.

If the KCVT function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

In the SQL procedure, or in a WHERE clause in any procedure, the maximum length of a word that is returned by the KCVT function is 200 characters.

Example
The following code converts IBM PC codes into DEC codes for the external text file specified as `my-input-file` and writes the results in OUTDD.

```sas
data _null_;
  infile 'my-input-file';
  file outdd noprint;
  input @1 text $char80.;
  text = kcvt(text, 'pcibm', 'dec');
  put @1 text $char80.;
rerun;
```

KFiND Function

Searches for a specific substring of characters within a character string.

Categories: CAS  
DBCS

Restriction:  
This function is assigned an I18N Level 2 status and is designed for DBCS data. However, if the first argument, string, has multi-byte characters, then the KFiND function processes the multi-byte data. For more information, see “Internationalization Compatibility for SAS String Functions” on page 341.

Syntax

KFiND(string,substring,<start-position>,<modifier(s)>)
KFiND(string,substring,<modifier(s)>,<start-position>)

Required Arguments

string
  specifies a character constant, variable, or expression that is searched for substrings.

  TIP  Enclose a literal string of characters in quotation marks.

substring
  is a character constant, variable, or expression that specifies the substring of characters to search for in string.

  TIP  Enclose a literal string of characters in quotation marks.

Optional Arguments

modifier(s)
  is a character constant, variable, or expression that specifies one or more modifiers. The following modifiers are valid:
i or I
ignores character case during the search. If this modifier is not specified, KFIND searches only for character substrings with the same case as the characters in substring.

t or T
trims trailing blanks from string and substring.

Note: If you want to remove trailing blanks from only one character argument instead of both (or all) character arguments, use the KTRIM function instead of the KFIND function with the T modifier.

TIP If modifier is a constant, enclose it in quotation marks. Specify multiple constants in a single set of quotation marks. Modifier can also be expressed as a variable or as an expression.

start-position
is a numeric constant, variable, or expression with an integer value that specifies the position at which the search should start and the direction of the search.

Details
Basics
The KFIND function searches string for the first occurrence of the specified substring, and returns the position of that substring. If the substring is not found in string, the KFIND function returns a value of 0.

If start-position is not specified, the KFIND function starts the search at the beginning of the string and searches the string from left to right. If start-position is specified, the absolute value of start-position determines the position at which to start the search. The sign of start-position determines the direction of the search.

<table>
<thead>
<tr>
<th>Value of startpos</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 0</td>
<td>Starts the search at position start-position and searches to the right. If start-position is greater than the length of string, KFIND returns a value of 0.</td>
</tr>
<tr>
<td>Less than 0</td>
<td>Starts the search at position start-position and searches to the left. If start-position is greater than the length of string, the search starts at the end of string.</td>
</tr>
<tr>
<td>Equal to 0</td>
<td>Returns a value of 0.</td>
</tr>
</tbody>
</table>

Example
This example uses Chinese characters:
KFINDC Function

Searches a string for any character in a list of characters.

Categories:
- CAS
- DBCS

Restriction: This function is assigned an I18N Level 2 status and is designed for DBCS data. However, if the first argument, string, has single-byte characters, then the KFINDC function processes the SBCS data. For more information, see "Internationalization Compatibility for SAS String Functions" on page 341.

Note: This function supports the varchar type.

Syntax

\[
\text{KFINDC}(\text{string}, \langle\text{character-list}\rangle)
\]

\[
\text{KFINDC}(\text{string}, \text{character-list}, \langle\text{modifier(s)}\rangle)
\]

\[
\text{KFINDC}(\text{string}, \text{character-list}, \text{modifier(s)}, \langle\text{start-position}\rangle)
\]

\[
\text{KFINDC}(\text{string}, \text{character-list}, \langle\text{start-position}\rangle, \langle\text{modifier(s)}\rangle)
\]

Required Arguments

- **string**
  is a character constant, variable, or expression that specifies the character string to search.

  **TIP** Enclose a literal string of characters in quotation marks.

- **character-list**
  is a constant, variable, or character expression that initializes a list of characters. The KFINDC function searches for the characters in this list provided that you do not specify the K modifier in the modifier argument. If you specify the K modifier, the KFINDC function searches for all characters that are not in this list of characters. You can add more characters to the list by using other modifiers.

- **modifier(s)**
  is a character constant, variable, or expression in which each character modifies the actions of the KFINDC function. The following characters, in uppercase or lowercase, can be used as modifiers:

  - **blank** is ignored.

---

data _null_
xyz='SAS是全球最大的软件公司之一,是全球商业智能和分析软件与服务领袖。';
pos_of=kfind(xyz, '软件'); /* Find first position of '软件' */
put pos_of =
run;
a or A  adds alphabetic characters to the list of characters.
b or B  scans string from right to left instead of from left to right.
c or C  adds control characters to the list of characters.
d or D  adds digits to the list of characters.
f or F  adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
g or G  adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.
h or H  adds a horizontal tab to the list of characters.
i or I  ignores the case of the characters.
k or K  searches for any character that does not appear in the list of characters. If you do not specify this modifier, then the KFINDC function searches for any character that appears in the list of characters. This modifier has the same functionality as the v or V modifier.
l or L  adds lowercase letters to the list of characters.
n or N  adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
o or O  processes the character-list and the modifier arguments only once rather than every time the KFINDC function is called. Using the O modifier in the DATA step (excluding WHERE clauses) or in the SQL procedure can make the KFINDC function run faster when you call it in a loop where the character-list and the modifier arguments do not change.
p or P  adds punctuation marks to the list of characters.
s or S  adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).
t or T  trims trailing blanks from the string and character-list arguments. If you want to remove trailing blanks from just one character argument instead of both character arguments, then use the TRIM function instead of the KFINDC routine with the T modifier.
u or U  adds uppercase letters to the list of characters.
v or V  searches for any character that does not appear in the list of characters. If you do not specify this modifier, then KFINDC searches for any character that appears in the list of characters. This modifier has the same functionality as the k or K modifier.
w or W  adds printable (writable) characters to the list of characters.
x or X  adds hexadecimal characters to the list of characters.

**TIP**  If modifier is a constant, then enclose it in quotation marks. Specify multiple constants in a single set of quotation marks. Modifier can also be expressed as a variable or as an expression.
Optional Argument

**start-position**

is an optional numeric constant, variable, or expression with an integer value that specifies the position at which the search should start and the direction in which to search.

Details

Basics

The KFINDC function searches string for the first occurrence of the specified characters and returns the position of the first character found. If no characters are found in string, then the KFINDC function returns a value of 0.

The KFINDC function allows character arguments to be null. Null arguments are treated as character strings that have a length of zero. Numeric arguments cannot be null.

If **start-position** is not specified, the KFINDC function begins the search at the end of the string if you use the **B** modifier or at the beginning of the string if you do not use the **B** modifier.

If **start-position** is specified, the absolute value of **start-position** specifies the position at which to begin the search. If you use the **B** modifier, the search always proceeds from right to left. If you do not use the **B** modifier, the sign of **start-position** specifies the direction in which to search. The following table summarizes the search directions:

<table>
<thead>
<tr>
<th>Value of <strong>startpos</strong></th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 0</td>
<td>Search begins at position <strong>start-position</strong> and proceeds to the right. If <strong>start-position</strong> is greater than the length of the string, the KFINDC function returns a value of 0.</td>
</tr>
<tr>
<td>Less than 0</td>
<td>Search begins at position <strong>start-position</strong> and proceeds to the left. If <strong>start-position</strong> is less than the negative of the length of the string, the search begins at the end of the string.</td>
</tr>
<tr>
<td>Equal to 0</td>
<td>Returns a value of 0.</td>
</tr>
</tbody>
</table>

Example

This example uses Chinese characters.

```plaintext
data _null_;  
xyz='SAS是全球最大的软件公司之一,是全球商业智能和分析软件与服务领袖。';  
pos_of=kfindc(xyz, '软件的');  /* Find minimum position of '软件的' */  
put pos_of = ;  
run;  
```
KFINDW Function

Returns the character position of a word in a string or the number of the word in a string.

Categories:
- CAS
- DBCS

Restriction:
This function is assigned an I18N Level 2 status and is designed for DBCS data. However, if the first argument, string, has single-byte characters, then the KFINDW function processes the SBCS data. For more information, see “Internationalization Compatibility for SAS String Functions” on page 341.

Syntax

\[
\text{KFINDW}(\text{string}, \text{word}, \text{<character-list>}) \\
\text{KFINDW}(\text{string}, \text{word}, \text{character-list}, \text{modifier(s)}, \text{<start-position>}) \\
\text{KFINDW}(\text{string}, \text{word}, \text{character-list}, \text{start-position}, \text{<modifier(s)>}) \\
\text{KFINDW}(\text{string}, \text{word}, \text{start-position}, \text{<character-list,modifier(s)>})
\]

Required Arguments

- **string**
  is a character constant, variable, or expression that specifies which character string to search.

- **word**
  is a character constant, variable, or expression that specifies the word to search for in string.

- **character-list**
  is an optional character constant, variable, or expression that initializes a list of characters.

  The characters in this list are the delimiters that separate words, provided that you do not specify the K modifier in the modifier argument. If you specify the K modifier, then all characters that are not in this list are delimiters. You can add more characters to this list by using other modifiers.

- **start-position**
  is an optional numeric constant, variable, or expression with an integer value that specifies the position at which the search should begin and the direction in which to search.

- **modifier**
  specifies a character constant, variable, or expression in which each non-blank character modifies the actions of the KFINDW function.

**TIP**  If you use the modifier argument, then it must be positioned after the character-list argument.
You can use these characters as modifiers:

- **blank** is ignored.
- **a** or **A** adds alphabetic characters to the list of characters.
- **b** or **B** scans a string from right to left instead of from left to right.
- **c** or **C** adds control characters to the list of characters.
- **d** or **D** adds digits to the list of characters.
- **e** or **E** counts the words that are scanned until the specified word is found instead of determining the character position of the specified word in the string. Fragments of a word are not counted.
- **f** or **F** adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
- **g** or **G** adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.
- **h** or **H** adds a horizontal tab to the list of characters.
- **i** or **I** ignores the case of the characters.
- **k** or **K** treats all characters that are not in the list of characters as delimiters. If K is not specified, then all characters that are in the list of characters are treated as delimiters.
- **l** or **L** adds lowercase letters to the list of characters.
- **n** or **N** adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
- **o** or **O** processes the **character-list** and **modifier** arguments only once rather than every time the KFINDW function is called. Using the O modifier in the DATA step (excluding WHERE clauses) or in the SQL procedure can make the KFINDW function run faster when you call it in a loop where the **character-list** and **modifier** arguments do not change.
- **p** or **P** adds punctuation marks to the list of characters.
- **q** or **Q** ignores delimiters that are inside substrings that are enclosed in quotation marks. If the value of the string argument contains unmatched quotation marks, then scanning from left to right produces different words than scanning from right to left.
- **r** or **R** removes leading and trailing delimiters from the word argument.
- **s** or **S** adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).
- **t** or **T** trims trailing blanks from the string, word, and character-list arguments.
- **u** or **U** adds uppercase letters to the list of characters.
- **w** or **W** adds printable (writable) characters to the list of characters.
- **x** or **X** adds hexadecimal characters to the list of characters.
Details

Delimiter

*Delimiter* refers to any of several characters that are used to separate words. You can specify the delimiters by using the *character* argument, the *modifier* argument, or both. If you specify the Q modifier, then the characters inside substrings that are enclosed in quotation marks are not treated as delimiters.

Word

*Word* refers to a substring that has both of the following characteristics:

- bounded on the left by a delimiter or the beginning of the string
- bounded on the right by a delimiter or the end of the string.

---

*Note:* A word can contain delimiters. In this case, the KFINDW function differs from the SCAN function, in which words are defined as containing no delimiters.

Searching for a String

If the KFINDW function fails to find a substring that both matches the specified word and satisfies the definition of a word, then the KFINDW function returns a value of 0.

If the KFINDW function finds a substring that both matches the specified word and satisfies the definition of a word, the value that is returned by the KFINDW function depends on whether the E modifier is specified:

- If you specify the E modifier, then the KFINDW function returns the number of complete words that were scanned while searching for the specified word. If *start-position* specifies a position in the middle of a word, then that word is not counted.
- If you do not specify the E modifier, then the KFINDW function returns the character position of the substring that is found.

If you specify the *start-position* argument, then the absolute value of *start-position* specifies the position at which to begin the search. The sign of *start-position* specifies the direction in which to search:

<table>
<thead>
<tr>
<th>Value of startpos</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than 0</td>
<td>Search begins at <em>start-position</em> and proceeds to the right. If <em>start-position</em> is greater than the length of the string, then the KFINDW function returns a value of 0.</td>
</tr>
<tr>
<td>Less than 0</td>
<td>Search begins at position <em>start-position</em> and proceeds to the left. If <em>start-position</em> is less than the negative of the length of the string, then the search begins at the end of the string.</td>
</tr>
<tr>
<td>Equal to 0</td>
<td>The KFINDW function returns a value of 0.</td>
</tr>
</tbody>
</table>
If you do not specify the start-position argument or the B modifier, then the KFINDW function searches from left to right starting at the beginning of the string. If you specify the B modifier, but do not use the start-position argument, then the KFINDW function searches from right to left starting at the end of the string.

**Using the KFINDW Function in ASCII and EBCDIC Environments**

If you use the KFINDW function with only two arguments, the default delimiters depend on whether your computer uses ASCII or EBCDIC characters.

- If your computer uses ASCII characters, then the default delimiters are as follows: blank ! $ % & ( ) * + , - . / ; < ^ |
  
  In ASCII environments that do not contain the ^ character, the KFINDW function uses the ~ character instead.

- If your computer uses EBCDIC characters, then the default delimiters are as follows: blank ! $ & ( ) * + , - . / ; < ¬ | ¢

**Using Null Arguments**

The KFINDW function allows character arguments to be null. Null arguments are treated as character strings with a length of zero. Numeric arguments cannot be null.

**Processing SBCS and DBCS Data**

The KFINDW function is designed to process SBCS data, but it can process DBCS data with certain conditions. Here are the criteria for SBCS and DBCS processing:

- If string is declared as varchar and you are processing multi-byte data, then the KFINDW function processes DBCS.

- If string is not declared as varchar or you are processing single-byte data, then the KFINDW function processes SBCS.

**Examples:**

**Example 1**

This example uses Chinese characters:

```sql
data _null_
  xyz='SAS是全球最大的软件公司之一，SAS是全球商业智能和分析软件与服务领袖。
  pos_of=kfindw(xyz, '软件'); /* The default delimiter is SBCS blank. */
  put pos_of =;
run;
```

**Example 2**

Here is another example:
data _null_;
xyz='SAS是全球最大的软件公司之一，sas是全球商业智能和分析软件与服务领域。';
pos_of=kfindx(xyz, 'sas', '', 'sp'); /* Use spaces and punctuations as delimiter. */
put pos_of =;
run;

pos_of=17

## KINDEX Function

Searches a character expression for a string of characters.

### Categories:
- CAS
- DBCS

### Restriction:
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see [Internationalization Compatibility](#) on page 341.

### Tip:
Non-DBCS equivalent function is [INDEX](#) in [SAS Functions and CALL Routines: Reference](#).

---

### Syntax

**KINDEX** *(source, excerpt)*

### Required Arguments

- **source**
  - specifies the character expression to search.

- **excerpt**
  - specifies the string of characters to search for in the character expression.

**Tip** Enclose a literal string of characters in quotation marks.

---

### Details

See “[Internationalization Compatibility for SAS String Functions](#)” on page 341 for restrictions and more information.

The KINDEX function searches *source*, from left to right, for the first occurrence of the string that is specified in *excerpt*, and returns the position in *source* of the string's first character. If the string is not found in *source*, KINDEX returns a value of 0. If there are multiple occurrences of the string, KINDEX returns only the position of the first occurrence.

---

### Example

The following example uses Japanese characters.
### KINDEXB Function

**Searches a character expression for specified characters and returns byte-based values.**

**Category:** DBCS  
**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see [Internationalization Compatibility on page 341](#).

#### Syntax

```
KINDEXB(source, excerpt)
```

#### Required Arguments

- **source**
  - Specifies the character expression to search for.

- **excerpt**
  - Specifies the string of characters to search for in the character expression.

#### Details

The KINDEXB function searches `source`, from left to right, for the first occurrence of the string that is specified in `excerpt` and returns the string's first character position in `source`. If the string is not found in `source`, KINDEXB returns a value of 0. If there

### Example

```plaintext
data _null_;  
text='漢字文字列の検索';  
result=kindex(text,'検索');  
put result=;  
text2='探す';  
result=kindex(text,text2);  
put result=;  
run;
```

### See Also

- **Functions:**
  - "KINDEXC Function" on page 426
are multiple occurrences of the string, KINDEXB returns only the position of the first occurrence.

Comparisons

KINDEXB returns byte-based values. KINDEX returns character-based values. When processing an SBCS string (for example, wlatin1 encoding), KINDEXB and KINDEX return identical results. But in a DBCS session (for example, EUC-JP or SHIFT-JIS encoding), most CJK characters are 2 bytes wide, causing these functions to return different results.

The KINDEXCB function searches for the first occurrence of any individual character that is present within the character string. The KINDEXB function searches for the first occurrence of the character string as a pattern.

Example

The following example uses Japanese characters.

```
data null;
  text='漢字文字列の検索';
  result=kindexb(text,'検索');
  put result=;
  text2='探す';
  result=kindexb(text,text2);
  put result=;
run;
```

KINDEXCB Function

Searches a character expression for specified characters and returns byte-based values.

Category: DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

```
KINDEXCB(source, excerpt-1, ...excerpt-n)
```

Required Arguments

source
  specifies the character expression to search for.

excerpt-1, ...excerpt-n
  specifies the characters to search for in the character expression.
Tips
If you specify more than one excerpt, separate them with a comma.
Enclose a literal string of characters in quotation marks.

Details
The KINDEXCB function searches the data in source, from left to right, for the first occurrence of any character in the excerpts’ arguments and returns the position in source of that character. If none of the characters in excerpt-1 through excerpt-n in source are found, KINDEXCB returns a value of 0.

Comparisons
KINDEXCB returns byte-based values. KINDEXC returns character-based values. When processing SBCS strings (for example, wlatin1 encoding), both functions return identical results. But in a DBCS session (for example, EUC-JP or SHIFT-JIS encoding), most CJK characters are 2 bytes wide, causing these functions to return different results.

The KINDEXCB function searches for the first occurrence of any individual character that is present within the character string, whereas the KINDEXB function searches for the first occurrence of the character string as a pattern.

Example
The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data _null.;</td>
<td>Result=13</td>
</tr>
<tr>
<td>a='ＡＢＣ.def (漢字123456)';</td>
<td></td>
</tr>
<tr>
<td>result=kindexcb(a, '1234567890', '感漢');</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

KINDEXC Function
Searches a character expression for specified characters and returns character-based values.

Categories: CAS
            DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: The Non-DBCS equivalent function is “INDEXC Function” in SAS Functions and CALL Routines: Reference
Syntax

**KINDEXC**(*source*, *excerpt-1*, ...*excerpt-n*)

Required Arguments

*source*
  specifies the character expression to search for.

*excerpt-1*, ...*excerpt-n*
  specifies the characters to search for in the character expression.

**Tips**
If you specify more than one excerpt, separate them with a comma.

Enclose a literal string of characters in quotation marks.

**Details**

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The KINDEXC function searches *source*, from left to right, for the first occurrence of any character present in the excerpts and returns the position in *source* of that character. If none of the characters in *excerpt-1* through *excerpt-n* in *source* are found, KINDEXC returns a value of 0.

**Comparisons**

The KINDEXC function searches for the first occurrence of any individual character that is present within the character string, whereas the KINDEX function searches for the first occurrence of the character string as a pattern.

**Example**

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>result=9</td>
</tr>
<tr>
<td>a=’A B C def (漢字123456)’;</td>
<td></td>
</tr>
<tr>
<td>result=kindexc(a,’1234567890’,’感漢’);</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

- "KINDEX Function" on page 423
KLEFT Function

Left-aligns a character expression by removing unnecessary leading DBCS blanks and SO/SI.

Categories:
- CAS
- DBCS

Restriction:
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Note:
This function supports the VARCHAR data type.

Tip:
Non-DBCS equivalent function is LEFT in SAS Functions and CALL Routines: Reference.

Syntax

KLEFT(argument)

Required Argument

argument
- specifies any SAS character expression.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

KLEFT returns an argument and removes the leading blanks.

The KLEFT, KRIGHT, and KTRIM functions remove the following Unicode space characters.

Table 13.6  Unicode Spaces That Are Removed by KLEFT, KRIGHT, and KTRIM

</tbody>
</table>

See Also

**Functions:**
- “KCOMPRESS Function” on page 403
- “KRIGHT Function” on page 442
- “KTRIM Function” on page 458

**KLENGTH Function**

Returns the length of an argument.

**Categories:**
- CAS
- DBCS

**Restriction:**
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

**Tip:**
Non-DBCS equivalent function is LENGTH in SAS Functions and CALL Routines: Reference.

**Syntax**

\[
\text{KLENGTH}(\text{argument})
\]

**Required Argument**

\[\text{argument}\]

specifies any SAS expression.
KLOWCASE Function

Converts the uppercase alphabetic letters to lowercase letters.

Categories: CAS  DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: Non-DBCS equivalent function is LOWCASE in SAS Functions and CALL Routines: Reference.

Syntax

KLOWCASE(argument)

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The KLENGTH function returns an integer that represents the position of the rightmost non-blank character in the argument. If the value of the argument is missing, KLENGTH returns a value of 0. If the argument is an uninitialized numeric variable, KLENGTH returns a value of 12 and prints a note in the SAS log that the numeric values have been converted to character values.

If you are using SBCS EnglishVARCHAR data, performance issues might occur. To improve the performance, use the following code with non-K functions.

This code improves performance and the results reflect the KLENGTH function’s behavior.

```
len = LENGTHC(TRIMN(x));
if NOT len then len = 1;
```

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>; text='abcあいう'; result=klength(text); put result=; run;</td>
<td>result=6</td>
</tr>
</tbody>
</table>

KLOWCASE Function

Converts the uppercase alphabetic letters to lowercase letters.
Required Argument

*argument*

specifies any SAS character expression.

Details

The KLOWCASE function copies a character argument, converts the uppercase alphabetic letters to lowercase letters, and returns the altered value.

The definitions of the alphabetic letters differ based on the SAS session encoding. Here are typical SAS sessions and how KLOWCASE processes alphabetic letters for the different sessions.

UTF-8 (SAS Unicode server)

When the SAS session encoding is UTF-8, the Unicode character attributes apply. If a character is classified as a letter and has a lowercase equivalent, KLOWCASE returns the lowercase letter. Otherwise, the same letter is returned.

DBCS (For example, Chinese, Japanese and Korean languages)

KLOWCASE converts uppercase letters in the English alphabet to lowercase in a DBCS SAS session.

SBCS (For example, English or European languages)

When the SAS session encoding is SBCS, the TRANTAB option is updated to use the mapping tables for uppercase letters and the lowercase letter equivalents. The mapping tables for lowercase letters use the naming pattern of `nnnn_lcs`, where `nnnn` matches the short encoding name. The KLOWCASE function uses these tables to convert the uppercase letters to the lowercase letters that are supported by the session encoding.

Examples:

Example 1

In this example, the text contains a mix of English alphabetic uppercase letters plus the uppercase Ñ. The SAS session encoding is Windows code page 1252, which is WLATIN1. Notice that KLOWCASE returns all the letters in lowercase, including the ñ. This example demonstrates results from KLOWCASE when the SAS encoding is SBCS and supports Western European characters. The same result is returned for UTF-8 text when the SAS encoding is UTF-8.

```sas
options locale=en_US;
data one;
x='NIÑO';
y=klowcase(x);
put x=;
put y=;
run;
```

```
x=NIÑO
y=niño
```

Example 2

This example uses a mix of Japanese and English alphabetic uppercase letters. In the result from KLOWCASE, the English alphabetic letters are converted to
lowercase and the Japanese characters are unchanged. The example demonstrates results from KLOWCASE when the SAS session uses a DBCS encoding that supports Japanese characters or UTF-8.

```sas
data _null_
  result=klowcase('ABCあいうえお')
  put result=
run;
result=abcあいうえお
```

---

**KPROPCASE Function**

Converts Chinese, Japanese, Korean, Taiwanese (CJKT) characters.

**Category:** DBCS

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

**Syntax**

```
str=KPROPCASE(<instr> , (<options> ))
```

**Required Arguments**

- `str`: data string that has been converted and is in the current SAS session encoding.
- `instr`: input data string.

**HALF-KATAKANA, FULL-KATAKANA**

This option converts half-width katakana to full-width katakana and is used only with Japanese encoding.

**Restriction**

This option cannot be used at the same time with the full-Katakana, half-Katakana option.

**FULL-KATAKANA, HALF-KATAKANA**

This option converts full-width katakana to half-width katakana and is used only with Japanese encoding.

**Restriction**

This option cannot be used at the same time with the half-Katakana, full-Katakana option.
**KATAKANA, ROMAJI**
This option converts the katakana character string to a romaji character string and is used only with Japanese encoding.

**Restriction**
This option cannot be used at the same time with the romaji, katakana option.

**ROMAJI, KATAKANA**
This option converts the romaji character string to a katakana character string and is used only with Japanese encoding.

**Restriction**
This option cannot be used at the same time with the katakana, romaji option.

**FULL-ALPHABET, HALF-ALPHABET**
This option converts the Full-Alphabet characters to Half-Alphabet characters and is used only with Japanese, Chinese, Korean, and Taiwanese encoding.

**Restriction**
This option cannot be used at the same time with the Half-Alphabet, Full-Alphabet option.

**HALF-ALPHABET, FULL-ALPHABET**
This option converts the Half-Alphabet characters to Full-Alphabet characters and is used only with Japanese, Chinese, Korean, and Taiwanese encoding.

**Restriction**
This option cannot be used at the same time with the Full-Alphabet, Half-Alphabet option.

**LOWERCASE, UPPERCASE**
This option converts lowercase alphabet characters to uppercase alphabet characters.

**Restriction**
This option cannot be used at the same time with the Uppercase, Lowercase option.

**UPPERCASE, LOWERCASE**
This option converts uppercase alphabet characters to lowercase alphabet characters.

**Restriction**
This option cannot be used at the same time with the Lowercase, Uppercase option.

**PROPER**
This option specifies the following default options based on the encoding:

- Japanese encoding
- Half-Katakana, Full-Katakana
- Full-alphabet, Half-alphabet
- Lowercase, Uppercase
- Korean encoding:
- Full-alphabet, Half-alphabet
- Chinese encoding:
- Full-alphabet, Half-alphabet
- Taiwanese encoding:
Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

This function converts the input string based on the specified options and default options. The KPROPCASE function supports the Chinese, Japanese, Korean, Taiwanese (CJKT) environment.

Example

The following example demonstrates the functionality of the KPROPCASE function:

```
length fullkana halfkana upper lower fullalpha $ 200;
length str1 str2 str3 str4 str5 str7 str8 $ 30 str6 $44;
lower = 'do-naxtutsu'; /* Doughnuts in Japanese Roman word. */
upper = 'DO-NAXTUTSU'; /* Doughnuts in Japanese Roman word. */
fullkana = unicode('\u30C9\u30FC\u30CA\u30C3\u30C4');
halfkana = unicode('\uFF84\uFF9E\uFF70\uFF85\uFF6F\uFF82');
fullalpha = unicode('\uFF24\uFF2F\uFF0D\uFF2E\uFF21\uFF38\uFF34\uFF35\uFF34\uFF33\uFF35');
str1 = kpropcase(fullkana, 'full-katakana,half-katakana');
if (halfkana EQ trim(str1)) then
  put str1= $hex14.;
str2 = kpropcase(halfkana, 'half-katakana, full-katakana');
if (fullkana EQ trim(str2)) then
  put str2= $hex22.;
str3 = kpropcase(fullkana, 'katakana,romaji');
if (trim(str3) EQ upper) then
  put str3= ;
str4 = kpropcase(upper, 'romaji,katakana');
if (trim(str4) EQ fullkana) then
  put str4= $hex22.;
str5 = kpropcase(fullalpha, 'full-alphabet, half-alphabet');
if (trim(upper) EQ str5) then
  put str5=;
str6 = kpropcase(upper, 'half-alphabet, full-alphabet');
if (trim(str6) EQ fullalpha) then
  put str6= $hex46.;
str7 = kpropcase(lower, 'lowercase, uppercase');
if (trim(str7) EQ upper) then
  put str7=;
str8 = kpropcase(upper, 'uppercase, lowercase');
if (trim(str8) EQ lower) then
  put str8=;
RESULTS:
str1=C4DEB0C5AFC220
str2=8368815B83698362836320
str3=DO-NAXTUTSU
str4=8368815B83698362836320
str5=DO-NAXTUTSU
str6=8263826B817C826D826082778273827482738272827420
str7=DO-NAXTUTSU
str8=do-naxtutsu
```
KPROPCHAR Function

Converts Unicode to the corresponding characters enclosed in parenthesis.

Category:  
DBCS

Restriction:  
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

```
str=KPROPCHAR(<instr>)
```

Required Arguments

- **str**: result string. Unicode is converted to characters.
- **instr**: input data string.

Details

This function converts Unicode such as ① (0x2460) to an equivalent character (1). The KPROPCHAR function converts the characters from the following ranges:

- Enclosed alphanumeric values: \u2460 to \u24FF. See http://www.unicode.org/charts/PDF/U2460.pdf.
- Dingbats: \u2776 to \u2793. See http://www.unicode.org/charts/PDF/U2700.pdf.
- Enclosed CJK letters and months: \u3200 to \u32FF. See http://www.unicode.org/charts/PDF/U3200.pdf.

Example

The following example demonstrates the functionality of the KPROPCHAR function. These examples are processed in a UTF8 SAS session:

```
length in1 out1 $30 ;
  in1=unicode('①②③');
  out1=KPROPCHAR(in1);
  put out1;
RESULTS:
(1) (20) (-10) (35)
```
KPROPDATA Function

Removes or converts unprintable characters.

Category: DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

\[ str=\text{KPROPDATA}(\text{<instr>}, (<\text{options}>), (<\text{input encode name}>), (<\text{output encode name}>)) \]

Required Arguments

- **str**  
  specifies a data string that has been converted and is in the session encoding.

- **instr**  
  specifies the input data string.

- **options**  
  specifies instructions on processing unprintable characters:

  - **UESC**  
    Converts unprintable characters using a Unicode escaped string (for example, \u0000\u1234).
TRIM
Removes unprintable characters. No replacement character is used.

BLANK or ' '
Replaces each unprintable character with a single-byte blank.

QUESTION or '?'
Replaces unprintable characters with a single-byte '?'.

HEX
Replaces unprintable characters with a hexadecimal representation (for example, 0x810x82).

TRUNCATE or TRUNC
Truncates the data string when the first unprintable character is encountered.

REMOVE
Removes the data string if any unprintable characters are found.

NCR
Encodes the unprintable characters using NCR representation if the code is available in Unicode.

PUNC
Note: This function runs in SAS Viya 3.5 and is not supported in SAS 9.

Converting commonly used 8-bit punctuation marks to 7-bit characters.
WLATIN1 characters are 1-byte, but some of these characters are 2-4 bytes in UTF-8. This option converts punctuation marks that are 1-byte in WLATIN1, but are 2-4 bytes in UTF-8. Here are the punctuation marks that can be converted:
<table>

</table>
## input encode name

specifies the input data's encoding name if necessary. If the input encode name is not specified, then the KPROPDATA function processes the data as the current SAS session encoded string. For information about SAS encoding names, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

## output encode name

specifies the output data's encoding name. If the encoding name is not specified, the KPROPDATA function recognizes the output as the current SAS session encoding. For information about SAS encoding names, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

### Details

This function converts the input data string to the current SAS session encoding and removes or replaces unprintable characters based on the options.

### Examples:

#### Example 1

The following example demonstrates the functionality of the KPROPDATA function:

```sas
data test;
  length instr $12;
  length str1 str2 str3 str4 str5 str6 str7 str8 str9 str10$ 50;
  instr = "534153"x||"ae"x || " System";
  put instr;
  str1 = kpropdata(instr);
  put str1= +2 str1= $hex26.;
  str2 = kpropdata(instr,'UESC');
  put str2= +2 str2= $hex26.;
  str3 = kpropdata(instr, 'UESC','wlatin1');
  put str3= +2 str3= $hex26.;
  str4 = kpropdata(instr,'TRIM', 'wlatin1');
  put str4= +2 str4= $hex26.;
  str5 = kpropdata(instr,'BLANK', 'wlatin1');
  put str5= +2 str5= $hex26.;
  str6 = kpropdata(instr,'?', 'wlatin1');
```
KREVERSE Function

441

put str6= +2 str6= $hex26.;
str7 = kpropdata(instr,'hex', 'wlatin1');
put str7= +2 str7= $hex26.;
str8 = kpropdata(instr,'TRUNC', 'wlatin1');
put str8= +2 str8= $hex26.;
str9 = kpropdata(instr,'REMOVE', 'wlatin1');
put str9= +2 str9= $hex26.;
str10 = kpropdata(instr,'NCR', 'wlatin1');
put str10= +2 str10= $hex26.;
run;

The preceding statements produce these results:
SAS? System
str1=SAS? System
str1=534153AE2053797374656D2020
str2=SAS? System
str2=534153AE2053797374656D2020
str3=SAS\uff6e System

str9=
str9=20202020202020202020202020
str10=SAS® System
str10=53415326233137343B20537973

Example 2
This example shows the functionality of the PUNC option. The string assigned to
instr contains several punctuation characters that are not ASCII characters. This
example was run in SAS with a WLATIN1 session encoding.
data _null_;
length instr $12;
length outstr $14;
instr = "—–‘’‚“”„•…‹›"; /* "969791928293948495858B9B"x */
put instr= /instr=hex.;
outstr = kpropdata(instr, 'PUNC');
put outstr= /outstr=hex.;
run;

The preceding statements produce these results:
instr =—–‘’‚“”„•…‹›
instr =979691928293948495858B9B
outstr=--'',"""*...<>
outstr=2D2D27272C2222222A2E2E2E3C3E

KREVERSE Function
Reverses a character expression.
Categories:

CAS
DBCS


Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: Non-DBCS equivalent function is REVERSE in SAS Functions and CALL Routines: Reference.

Syntax
KREVERSE(argument)

Required Argument
argument specifies any SAS character expression.

Details
See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

Example
The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>result=kreverse('漢字のテスト');</td>
<td>result=トテストの字漢</td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

KRIGHT Function
Right-aligns a character expression by trimming trailing DBCS blanks and SO/SI.

Categories:
- CAS
- DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: See “RIGHT Function” in SAS Functions and CALL Routines: Reference.

Syntax
KRIGHT(argument)
Required Argument

**argument**

specifies any SAS character expression.

Details

See "Internationalization Compatibility for SAS String Functions" on page 341 for restrictions and more information.

The KRIGHT function returns an argument with trailing blanks moved to the start of the value. The argument's length does not change.

The KRIGHT, KLEFT and KTRIM functions remove Unicode space characters. See Table 13.30 on page 428 for a list of the Unicode characters.

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>a='漢字のテスト';</td>
<td>漢字のテスト</td>
</tr>
<tr>
<td>b=kright(a);</td>
<td>漢字のテスト</td>
</tr>
<tr>
<td>put '-----1-----2----';</td>
<td></td>
</tr>
<tr>
<td>put a $25.;</td>
<td></td>
</tr>
<tr>
<td>put b $25.;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**Functions:**

- "KCOMPRESS Function" on page 403
- "KLEFT Function" on page 428
- "KTRIM Function" on page 458

KSCAN Function

Selects a specified word from a character expression.

Categories: CAS

DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Non-DBCS equivalent function is SCAN in SAS Functions and CALL Routines: Reference.

Syntax

KSCAN(argument,n<, delimiters>)

Required Arguments

argument
specifies any character expression.

n
specifies a numeric expression that produces the number of the word in the character expression that you want KSCAN to select.

Tip If n is negative, KSCAN selects the word in the character expression starting from the end of the string. If |n| is greater than the number of words in the character expression, KSCAN returns a blank value.

delimiters
specifies a character variable that produces characters that you want KSCAN to use as word separators in the character expression.

Defaults
If you omit delimiters in an ASCII environment, SAS uses blank . < (+ & ! $ * ) ; ^ – / , % |. In ASCII environments without the ^ character, KSCAN uses the ~ character instead.

If you omit delimiters on an EBCDIC environment, SAS uses blank . < (+ | & ! $ * ) ; ¬ – / , % |¢

Tip If you represent delimiters as a constant, enclose delimiters in quotation marks.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

Leading delimiters before the first word in the character string do not effect KSCAN. If there are two or more contiguous delimiters, KSCAN treats them as one.

The KSCAN function does not have a modify argument. Use the KSCANX function if you need the modify functionality. KSCANX is a complete NLS replacement for the SCAN function.

Example

The following example uses Japanese characters.
### KSCANX Function

Selects a specified word from a character expression using a modifier to process the function's action.

**Categories:**
- CAS
- DBCS

**Restriction:**
This function is assigned an I18N Level 2 status, and is designed for DBCS data. However, if the first argument, string has single-byte characters, then the KSCANX function processes the SBCS data. For more information, see "Internationalization Compatibility for SAS String Functions" on page 341.

**Syntax**

\[
\text{KSCANX}(\text{string, count},<\text{character-list}>,<\text{modifier}>)
\]

**Required Arguments**

- **string**
  specifies a character constant, variable, or expression.

---

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>x=これ</td>
</tr>
<tr>
<td>length x $20 y $20;</td>
<td>x=漢字関数</td>
</tr>
<tr>
<td>text1='これは漢字関数のテストです。';</td>
<td>x=テストです。</td>
</tr>
<tr>
<td>x='norblank';</td>
<td>x=</td>
</tr>
<tr>
<td>i=1;</td>
<td>y=テストです。</td>
</tr>
<tr>
<td>do until(x='');</td>
<td>y=漢字関数</td>
</tr>
<tr>
<td>x=kscan(text1,i,'はの');</td>
<td>y=これ</td>
</tr>
<tr>
<td>put x=;</td>
<td>y=</td>
</tr>
<tr>
<td>i=i+1;</td>
<td></td>
</tr>
<tr>
<td>end;</td>
<td></td>
</tr>
<tr>
<td>y='norblank';</td>
<td></td>
</tr>
<tr>
<td>i=-1;</td>
<td></td>
</tr>
<tr>
<td>do until(y='');</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>i=i-1;</td>
<td></td>
</tr>
<tr>
<td>end;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

---

**See Also**

"KSCANX Function" on page 445
count
is a nonzero numeric constant, variable, or expression that has an integer value. The integer value specifies the number of the word in the character string that you want KSCANX to select. For example, a value of 1 indicates the first word, a value of 2 indicates the second word, and so on. The following rules apply:

- If count is positive, KSCANX counts words from left to right in the character string.
- If count is negative, KSCANX counts words from right to left in the character string.

Optional Arguments

character-list
specifies an optional character expression that initializes a list of characters. This list determines which characters are used as the delimiters that separate words. The following rules apply:

- By default, all characters in character-list are used as delimiters.
- Specifying a modifier can also change the character-list used as delimiters. For example, if you specify the K modifier in the modifier argument, then all characters that are not in character-list are used as delimiters.

Note: For more information see “Using Default Delimiters in ASCII and EBCDIC Environments” in SAS Functions and CALL Routines: Reference.

TIP You can add more characters to character-list by using other modifiers.

modifier
specifies a character constant, variable, or expression in which each non-blank character modifies the action of the KSCANX function. Blanks are ignored. Use the following characters as modifiers:

- a or A adds alphabetic characters to the list of characters.
- b or B scans string from right to left instead of from left to right.
- c or C adds control characters to the list of characters.
- d or D adds digits to the list of characters.
- f or F adds an underscore and English letters (that is, valid first characters in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
- g or G adds graphic characters to the list of characters. Graphic characters are those that, when printed, produce an image on paper.
- h or H adds a horizontal tab to the list of characters.
- i or I ignores the case of the characters.
- k or K causes all characters that are not in the list of characters to be treated as delimiters. That is, if K is specified, then characters that are in the list of characters are kept in the returned value rather than being omitted because they are delimiters. If K is not
specified, then all characters that are in the list of characters are treated as delimiters.

- **l or L** adds lowercase letters to the list of characters.
- **m or M** specifies that multiple consecutive delimiters, and delimiters at the beginning or end of the *string* argument, refer to words that have a length of zero. If the M modifier is not specified, then multiple consecutive delimiters are treated as one delimiter, and delimiters at the beginning or end of the *string* argument are ignored.
- **n or N** adds digits, an underscore, and English letters (that is, the characters that can appear in a SAS variable name using VALIDVARNAME=V7) to the list of characters.
- **o or O** processes the *character-list* and *modifier* arguments only once, rather than every time the KSCANX function is called. Using the O modifier in the DATA step (excluding WHERE clauses), or in the SQL procedure can make KSCANX run faster when you call it in a loop where the *character-list* and *modifier* arguments do not change. The O modifier applies separately to each instance of the KSCANX function in your SAS code, and does not cause all instances of the KSCANX function to use the same delimiters and modifiers.
- **p or P** adds punctuation marks to the list of characters.
- **q or Q** ignores delimiters that are inside substrings that are enclosed in quotation marks. If the value of the *string* argument contains unmatched quotation marks, then scanning from left to right produces different words than scanning from right to left.
- **r or R** removes leading and trailing blanks from the word that KSCANX returns. If you specify the Q and R modifiers, the KSCANX function first removes leading and trailing blanks from the word. Then, if the word begins with a quotation mark, KSCANX also removes one layer of quotation marks from the word.
- **s or S** adds space characters to the list of characters (blank, horizontal tab, vertical tab, carriage return, line feed, and form feed).
- **t or T** trims trailing blanks from the *string* and *character-list* arguments. If you want to remove trailing blanks from just one character argument instead of both character arguments, then use the TRIM function instead of the KSCANX routine with the T modifier.
- **u or U** adds uppercase letters to the list of characters.
- **w or W** adds printable (writable) characters to the list of characters.
- **x or X** adds hexadecimal characters to the list of characters.

**TIP** If the *modifier* argument is a character constant, enclose the argument in quotation marks. Specify multiple modifiers in a single set of quotation marks. A *modifier* argument can also be expressed as a character variable or expression.
Details

Delimiter and Word

A delimiter is any of several characters that are used to separate words. You can specify the delimiters in the character-list and modifier arguments.

If you specify the Q modifier, delimiters inside substrings that are enclosed in quotation marks are ignored.

In the KSCANX function, word refers to a substring that has all of these characteristics:

- is bounded on the left by a delimiter or the beginning of the string
- is bounded on the right by a delimiter or the end of the string
- A word can have a length of zero if there are delimiters at the beginning or end of the string, or if the string contains two or more consecutive delimiters. However, the KSCANX function ignores words that have a length of zero unless you specify the M modifier.

Using Default Delimiters in ASCII and EBCDIC Environments

If you use the KSCANX function with only two arguments, then the default delimiters depend on whether your computer uses ASCII or EBCDIC characters.

- If your computer uses ASCII characters, the default delimiters are:
  blank ! $ % & ( ) * + , - . / ; < ^ |
  In ASCII environments that do not contain the ^ character, the KSCANX function uses the ~ character instead.
- If your computer uses EBCDIC characters, then the default delimiters are as follows:
  blank ! $ % & ( ) * + , - . / ; ¬ | ¢

If you use the modifier argument without specifying any characters as delimiters, then the only delimiters that are used are delimiters that are defined by the modifier argument. In this case, the lists of default delimiters for ASCII and EBCDIC environments are not used. In other words, modifiers add to the list of delimiters that are explicitly specified by the character-list argument. Modifiers do not add to the list of default modifiers.

Using the KSCANX Function with the M Modifier

If you specify the M modifier, the number of words in a string is defined as one plus the number of delimiters in the string. However, if you specify the Q modifier, delimiters that are inside quotation marks are ignored.

If you specify the M modifier, the KSCANX function returns a word with a length of zero if one of these conditions is true:

- The string begins with a delimiter and you request the first word.
- The string ends with a delimiter and you request the last word.
- The string contains two consecutive delimiters and you request the word that is between the two delimiters.
Using the KSCANX Function without the M Modifier

If you do not specify the M modifier, the number of words in a string is defined as the number of maximal substrings of consecutive non-delimiters. However, if you specify the Q modifier, delimiters that are inside quotation marks are ignored.

If you do not specify the M modifier, the KSCANX function acts in these ways:

- ignores delimiters at the beginning or end of the string
- treats two or more consecutive delimiters as if they were a single delimiter

If the string contains no characters other than delimiters, or if you specify a count that is greater in absolute value than the number of words in the string, then the KSCANX function returns one of the following items:

- a single blank when you call the KSCANX function from a DATA step
- a string with a length of zero when you call the KSCANX function from the macro processor.

Using Null Arguments

This example scans a string for the first and last words:

- A negative count instructs the KSCANX function to scan from right to left.
- Leading and trailing delimiters are ignored because the M modifier is not used.
- In the last observation, all characters in the string are delimiters.

Example

This example uses Chinese characters:

```sas
data _null_
  xyz='SAS是全球最大的软件公司之一。sas是全球商业智能和分析软件与服务领袖。';
  substr=kscan(xyz, 2, '', 'sp'); /* Use spaces and punctuations as delimiter. */
  put substr=;
run;
```

KSTRCAT Function

Concatenates two or more character expressions.

Categories: CAS DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: Non-DBCS equivalent function is CAT in SAS Functions and CALL Routines: Reference.
Syntax

KSTRCAT(argument-1, argument-2<, ... argument-n>)

Required Argument

argument

specifies any single-byte or double-byte character expression.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

If the KSTRCAT function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

In the SQL procedure, or in a WHERE clause in any procedure, the maximum length of a word that is returned by the KSTRCAT function is 200 characters.

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>; text1='漢字'; text2='文字列'; text3='連結'; result=kstrcat(text1,text2,'の',text3); put result=; run;</td>
<td>result=漢字文字列の連結</td>
</tr>
</tbody>
</table>

KSTRIP Function

Removes leading and trailing blanks from a character string.

Categories: CAS Character

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Note: This function supports the VARCHAR data type.
Syntax

KSTRIP(string)

Required Argument

string
specifies a character constant, variable, or expression.

Details

The KSTRIP function returns the argument with all leading and trailing SBCS blanks removed. If the argument is blank, KSTRIP returns a string with a length of zero.

Assigning the results of KSTRIP to a variable does not affect the length of the receiving variable. If the value that is trimmed is shorter than the length of the receiving variable, SAS pads the value with new trailing blanks.

In a DATA step, if the KSTRIP function returns a value to a variable that has not previously been assigned a length, then that variable is given the length of the argument.

Comparisons

The KSTRIP and STRIP functions return a string with a length of zero, for strings that are blank, and the TRIM function returns a single blank.

The KSTRIP and STRIP functions truncate the output if the receiving variable length is less than the input string. The STRIP function processes only SBCS string truncation. The KSTRIP function processes SBCS and DBCS data.

The KSTRIP and STRIP functions normalize data by removing unnecessary blanks. The KSTRIP function should be used in a DBCS environment. The KSTRIP and STRIP functions behave similarly. The KTRIM and KLEFT functions can also be used for data normalization. However, the KTRIM and KLEFT functions remove all types of DBCS spaces and can cause performance problems, as in this code example:

```syntax
long_char_variable = KTRIM(KLEFT(long_char_variable));
```

The KSTRIP function resolves these issues. You can modify the code using the KSTRIP function to successfully perform DBCS data normalization in a DBCS SAS session using this code:

```syntax
long_char_variable = KSTRIP(long_char_variable);
```

Example

The following example shows how the KSTRIP function deletes leading and trailing blanks, and how the DBCS character is truncated. This example uses the Japanese Shift_JIS encoding,
Statements

```sas
data _null_;  
length a $5;  
v = unicode('три');  
put v = hex.;  
a = kstrip(v);  
put a = hex.;  
run;
```

**Function**

- "STRIP Function" in *SAS Functions and CALL Routines: Reference*

---

**KSUBSTR Function**

Extracts a substring from an argument.

**Categories:**

- CAS
- DBCS

**Restriction:**

This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see *Internationalization Compatibility* on page 341.

**Tip:**

See “SUBSTR (right of =) Function” in *SAS Functions and CALL Routines: Reference*.

---

**Syntax**

```sas
KSUBSTR(argument, position<n>)
```

**Required Arguments**

- `argument`
  - specifies any SAS character expression.

- `position`
  - specifies a numeric expression that is the beginning character position.

- `n`
  - specifies a numeric expression that is the length of the substring to extract.
Interaction
If $n$ is larger than the length of the expression that remains in `argument` after `position`, SAS extracts the remainder of the expression.

Tip
If you omit $n$, SAS extracts the remainder of the expression.

Details
See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The `KSUBSTR` function returns a portion of an expression that you specify in `argument`. The portion begins with the character specified by `position` and is the number of characters specified by $n$.

A variable that is created by `KSUBSTR` obtains its length from the length of `argument`.

Example
The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>text='漢字文字列の抽出';</td>
<td>result='漢字'</td>
</tr>
<tr>
<td>result=ksubstr(text,1,2);</td>
<td>result='文字列の'</td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>result=ksubstr(text,3,4);</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>kstart=7;</td>
<td></td>
</tr>
<tr>
<td>klen=2;</td>
<td></td>
</tr>
<tr>
<td>result=ksubstr(text,kstart,klen);</td>
<td></td>
</tr>
<tr>
<td>put result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

Function:
- “`KSUBSTRB` Function” on page 453

`KSUBSTRB` Function

Extracts a substring from an argument according to the byte position of the substring in the argument.

Category: DBCS
Syntax
KSUBSTRB(\texttt{argument, position<,n> })

Required Arguments
\textbf{argument} specifies any SAS character expression.

\textbf{position} specifies the beginning character position in byte units.

\textbf{n} specifies the length of the substring to extract in byte units.

**Interaction**
If \textit{n} is larger than the length (in byte units) of the expression that remains in \textit{argument} after \textit{position}, SAS extracts the remainder of the expression.

**Tip** If you omit \textit{n}, SAS extracts the remainder of the expression.

Details

See "Internationalization Compatibility for SAS String Functions" on page 341 for restrictions and more information.

The KSUBSTRB function returns a portion of an expression that you specify in \textit{argument}. The portion begins with the byte unit specified by \textit{position} and is the number of byte units specified by \textit{n}.

A variable that is created by KSUBSTRB obtains its length from the length of \textit{argument}.

Examples:
Example 1
The following examples use Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>\textbf{data} <em>null</em>;</td>
<td>\textbf{result}=漢字文</td>
</tr>
<tr>
<td>\texttt{text='漢字文字列の抽出'};</td>
<td>\textbf{result}=字文</td>
</tr>
<tr>
<td>\texttt{result=ksubstrb(text,1,6)};</td>
<td></td>
</tr>
<tr>
<td>\texttt{put result=};</td>
<td></td>
</tr>
<tr>
<td>\texttt{result=ksubstrb(text,3,5)};</td>
<td></td>
</tr>
<tr>
<td>\texttt{put result=};</td>
<td></td>
</tr>
<tr>
<td>\texttt{run;}</td>
<td></td>
</tr>
</tbody>
</table>
Example 2

If the position or n arguments do not align at the character boundary, broken characters are converted to blanks. In this example, the broken characters become 0x20 (SBCS blank).

```sas
data _null_
  length sub ksub ksubb $6;
  str  = '中国语'
  sub  = substr(str, 2, 6);
  ksub = ksubstr(str, 2, 6);
  ksubb = ksubstrb(str, 2, 6);
  put str= / str= $hex10.;
  put sub= / sub= $hex12.;
  put ksub= / ksub= $hex12.;
  put ksubb= / ksubb= $hex12.;
run;
```

These statements produce these results:

```
str  = 中国语
str  = E4B8ADE59BBDE8AFAD
sub  = ropri
sub  = B8ADE59BBDE8
ksub = 国语
ksub = E59BBDE8AFAD
ksubb = 国
ksubb = 2020E59BBD20
```

See Also

Function:
- “KSUBSTR Function” on page 452

KSUBSTRN Function

Returns a substring, allowing a result with a length of zero.

Category: DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8).

See: “SUBSTRN Function” in SAS Functions and CALL Routines: Reference and “Internationalization Compatibility for SAS String Functions” on page 341 for more information.
Syntax

KSUBSTRN(string, position, <length>)

Required Arguments

string
specifies a character or numeric constant, variable, or expression.

If string is numeric, then it is converted to a character value that uses the
BEST32 format. Leading and trailing blanks are removed, and no message is
sent to the SAS log.

position
is an integer that specifies the position of the first character in the substring.

Optional Argument

length
is an integer that specifies the length of the substring. If you do not specify
length, the KSUBSTRN function returns the substring that extends from the
position that you specify to the end of the string.

Details

The functionality of KSUBTRN is similar to SUBSTRN. The difference is that if the
first parameter is numeric, SUBSTRN’s output length is 8, and KSUBSTRN’s output
length is 200.

Example

This example shows the different functionality between the functions KSUBSTR and
KSUBSTRN.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>ksubstr_result = **</td>
<td></td>
</tr>
<tr>
<td>put ksubstr_result=;</td>
<td></td>
</tr>
<tr>
<td>ksubstr_result = **</td>
<td></td>
</tr>
<tr>
<td>put ksubstr_result=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

KTRANSLATE Function

Replaces specific characters in a character expression.

Categories: CAS
               DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS,
               DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility
               on page 341.
KTRANSLATE Function

z/OS specifics: This function runs only on z/OS. Uses the EBCDIC code sequence.

Tip: Non-DBCS equivalent function is TRANSLATE in SAS Functions and CALL Routines: Reference.

Syntax

KTRANSLATE(source,to-1,from-1<,..,to-n,from-n> )

Required Arguments

source
specifies the SAS expression that contains the original character value.

to
specifies the characters that you want KTRANSLATE to use as substitutes.

from
specifies the characters that you want KTRANSLATE to replace.

Interaction Values of to and from correspond on a character-by-character basis; KTRANSLATE changes character one of from to character one of to, and so on. If to has fewer characters than from, KTRANSLATE changes the extra from characters to blanks. If to has more characters than from, KTRANSLATE ignores the extra to characters.

Note You must have pairs of to and from arguments on some operating environments. On other operating environments, a segment of the collating sequence replaces null from arguments.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

You can use KTRANSLATE to translate a single-byte character expression to a double-byte character expression, or translate a double-byte character expression to a single-byte character expression.

The maximum number of pairs of to and from arguments that KTRANSLATE accepts depends on which operating environment you use to run SAS. There is no functional difference between using several pairs of short arguments, or fewer pairs of longer arguments.

If the KTRANSLATE function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

Example

The following example uses Japanese characters.

data _null_
result = KTRANSLATE('仲等', '中忠', '仲仲');
put result=:
run;
KTRIM Function

Removes trailing DBCS blanks and SO/SI from character expressions.

Categories: CAS  
           DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Tip: Non-DBCS equivalent function is “TRIM Function” in SAS Functions and CALL Routines: Reference.

Syntax

\[ \text{KTRIM}(\text{argument}) \]

Required Argument

\( \text{argument} \)

specifies any SAS character expression.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

KTRIM copies a character argument, removes all trailing blanks, and returns the trimmed argument as a result. If the argument is blank, KTRIM returns one blank. KTRIM is useful for concatenating because concatenation does not remove trailing blanks.

Note: If the argument is blank, KTRIM returns one blank for the CHAR type. If the argument is blank, KTRIM returns an empty blank or 0 value for the varchar type. The varchar type uses character semantics, and the CHAR type uses byte semantics.

Assigning the results of KTRIM to a variable does not affect the length of the receiving variable. If the trimmed value is shorter than the length of the receiving variable, SAS pads the value with new blanks as it assigns it to the variable.

The KRIGHT, KLEFT and KTRIM functions remove Unicode space characters. See Table 13.30 on page 428 for a list of the Unicode characters.

Example

The following example uses Japanese characters.
### Statements

```sas
data _null_
  part1='漢字の　';
  part2='テスト';
  hasblank=part1||part2;
  noblank=ktrim(part1)||part2;
  put hasblank;
  put noblank;
run;
```

### Results

<table>
<thead>
<tr>
<th>漢字の　テスト</th>
<th>漢字のテスト</th>
</tr>
</thead>
</table>

### See Also

**Functions:**
- “KCOMPRESS Function” on page 403
- “KLEFT Function” on page 428
- “KRIGHT Function” on page 442

### KTRUNCATE Function

Truncates a string to a specified length in byte unit without breaking multibyte characters.

**Category:** DBCS

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see [Internationalization Compatibility on page 341](#).

**Syntax**

```
KTRUNCATE(argument, number, length)
```

**Required Arguments**

- **argument**
  - specifies any SAS character expression.

- **number**
  - is numeric.

- **length**
  - is an integer.

**Details**

See “[Internationalization Compatibility for SAS String Functions](#)” on page 341 for restrictions and more information.
The KTRUNCATE function truncates a full-length number (stored as a double) to a smaller number of bytes, as specified in length and pads the truncated bytes with 0s. The truncation and subsequent expansion duplicate the effect of storing numbers in less than full length and then reading them.

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>x1=ktruncate('漢字のテスト',4);</td>
<td>x1=漢字</td>
</tr>
<tr>
<td>x2=ktruncate('漢字のテスト',5);</td>
<td>x2=漢字</td>
</tr>
<tr>
<td>x3=ktruncate('漢字のテスト',6);</td>
<td>x3=漢字</td>
</tr>
<tr>
<td>y1=ktruncate('漢字のテスト',3,6);</td>
<td>y1=字のテスト</td>
</tr>
<tr>
<td>y2=ktruncate('漢字のテスト',4,6);</td>
<td>y2=のテスト</td>
</tr>
<tr>
<td>y3=ktruncate('漢字のテスト',5,6);</td>
<td>y3=のテスト</td>
</tr>
<tr>
<td>put x1= / x2= / x3= / y1= / y2= / y3=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**KUPCASE Function**

Converts the lowercase alphabetic letters to uppercase letters.

**Categories:** CAS

**Restriction:**
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

**Tip:** See “UPCASE Function” in SAS Functions and CALL Routines: Reference.

**Syntax**

KUPCASE(argument)

**Required Argument**

**argument**

specifies any SAS character expression.

**Details**

The KUPCASE function copies a character argument, converts the lowercase alphabetic letters to uppercase letters, and returns the altered value.
The definitions of the alphabetic letters differ based on the SAS session encoding. Here are typical SAS sessions and how KUPCASE processes alphabetic letters for the different sessions.

**UTF-8 (SAS Unicode server)**
When the SAS session encoding is UTF-8, the Unicode character attributes apply. If a character is classified as a letter and has an uppercase equivalent, KUPCASE returns the uppercase letter. Otherwise, the same letter is returned.

**DBCS (For example, Chinese, Japanese, and Korean languages)**
KUPCASE converts lowercase letters in the English alphabet to uppercase in a DBCS SAS session.

**SBCS (For example, English or European languages)**
When the SAS session encoding is SBCS, the TRANTAB option is updated to use the mapping tables for uppercase letters and the lowercase equivalents. The mapping tables for uppercase letters use the naming pattern of $nnnn_{ucs}$, where $nnnn$ matches the short encoding name that is documented in *SAS National Language Support (NLS): Reference Guide*. The KUPCASE function uses these tables to convert the lowercase letters to the uppercase letters that are supported by the session encoding.

**Examples:**

**Example 1**
In this example, the text contains a mix of English alphabetic lowercase letters plus the lowercase ň. The SAS session encoding is Windows code page 1252, which is WLATIN1. Notice that KUPCASE returns all the letters in uppercase, including the ň. This example demonstrates results from KUPCASE when the SAS encoding is SBCS and supports Western European characters. The same result is returned for UTF-8 text when the SAS encoding is UTF-8.

```sas
options locale=en_US;
data one;
x='niño';
y=kupcase(x);
   put x=;
   put y=;
run;
```

```
x=niño
y=NIÑO
```

**Example 2**
This example uses a mix of Japanese and English alphabetic lowercase letters. In the result from KUPCASE, the English alphabetic letters are converted to uppercase and the Japanese characters are unchanged. The example demonstrates results from KUPCASE when the SAS session uses a DBCS encoding that supports Japanese characters or UTF-8. 
KUPDATE Function

Inserts, deletes, and replaces character value contents.

Categories:
- CAS
- DBCS

Restriction:
This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

\[
\text{KUPDATE}(\text{argument}, \text{position}, n<, \text{characters-to-replace}>)
\]

\[
\text{KUPDATE}(\text{argument, position}<, n>, \text{characters-to-replace})
\]

Required Arguments

- **argument**
  - specifies a character variable.

- **position**
  - specifies a numeric expression that is the beginning character position.

- **n**
  - specifies a numeric expression that is the length of the substring to be replaced.

<table>
<thead>
<tr>
<th>Restrictions</th>
<th>n cannot be larger than the length of the expression that remains in argument after position.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>n is optional, but you cannot omit both n and characters-to-replace from the function.</td>
</tr>
<tr>
<td>Tip</td>
<td>If you omit n, SAS uses all of the characters in characters-to-replace to replace the values of argument.</td>
</tr>
</tbody>
</table>

- **characters-to-replace**
  - specifies a character expression that replaces the contents of argument.

<table>
<thead>
<tr>
<th>Restriction</th>
<th>characters-to-replace is optional, but you cannot omit both characters-to-replace and n from the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tip</td>
<td>Enclose a literal string of characters in quotation marks.</td>
</tr>
</tbody>
</table>

```sas
data _null_
  result=kupdate('abcあいうえお');
  put result=
run;

result=ABCあいうえお
```
Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The KUPDATE function replaces the value of argument with the expression in characters-to-replace starting at the character that you specify in position.

If the KUPDATE function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

In the SQL procedure, or in a WHERE clause in any procedure, the maximum length of a word that is returned by the KUPDATE function is 200 characters.

Examples:

Example 1

The following example shows the difference between KUPDATE and KUPDATES.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>x1=1 56</td>
</tr>
<tr>
<td>str='123456';</td>
<td>y1=156</td>
</tr>
<tr>
<td>x1=str; substr(x1,2,3)=&quot;&quot;;</td>
<td>z1=1 56</td>
</tr>
<tr>
<td>y1=kupdate(str,2,3);</td>
<td>x2=1abc56</td>
</tr>
<tr>
<td>z1=kupdates(str,2,3);</td>
<td>y2=1abc56</td>
</tr>
<tr>
<td>put x1= / y1= / z1=;</td>
<td>z2=1abc56</td>
</tr>
<tr>
<td>x2=str; substr(x2,2,3)=&quot;abcd&quot;;</td>
<td>x3=lab 56</td>
</tr>
<tr>
<td>y2=kupdate(str,2,3,'abcd');</td>
<td>y3=lab56</td>
</tr>
<tr>
<td>z2=kupdates(str,2,3,'abcd');</td>
<td>z3=lab 56</td>
</tr>
<tr>
<td>put x2= / y2= / z2=;</td>
<td></td>
</tr>
<tr>
<td>x3=str; substr(x3,2,3)=&quot;ab&quot;;</td>
<td></td>
</tr>
<tr>
<td>y3=kupdate(str,2,3,'ab');</td>
<td></td>
</tr>
<tr>
<td>z3=kupdates(str,2,3,'ab');</td>
<td></td>
</tr>
<tr>
<td>put x3= / y3= / z3=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

Example 2

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>x1=漢字のテスト</td>
</tr>
<tr>
<td>x1=kupdate('感じのテスト',1,2,'漢字');</td>
<td>x2=kaのテスト</td>
</tr>
<tr>
<td>x2=kupdate(x1,1,2,'kanji');</td>
<td>x3=テスト</td>
</tr>
<tr>
<td>x3=kupdate(x1,1,3);</td>
<td>x4=漢字かんじ</td>
</tr>
<tr>
<td>x4=kupdate(x1,3,'かんじ');</td>
<td></td>
</tr>
<tr>
<td>put x1= / x2= / x3= / x4=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>
KUPDATEB Function

Inserts, deletes, and replaces the contents of the character value according to the byte position of the character value in the argument.

Category: DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

KUPDATEB(argument, position, n<, characters-to-replace> )

KUPDATEB(argument, position <, n>, characters-to-replace)

Required Arguments

argument specifies a character variable.

position specifies the beginning character position in byte units.

n specifies the length of the substring to be replaced in byte units.

Restrictions

n cannot be larger than the length (in bytes) of the expression that remains in argument after position.

n is optional, but you cannot omit both n and characters-to-replace from the function.

Tip

If you omit n, SAS uses all of the characters in characters-to-replace to replace the values of argument.

characters-to-replace specifies a character expression to replace the contents of argument.

Restriction

characters-to-replace is optional, but you cannot omit both characters-to-replace and n from the function.

Tip

Enclose a literal string of characters in quotation marks.
Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The KUPDATEB function replaces the value of argument with the expression in characters-to-replace. KUPDATEB replaces n byte units starting at the byte unit that you specify in position.

If the KUPDATEB function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

In the SQL procedure, or in a WHERE clause in any procedure, the maximum length of a word that is returned by the KUPDATEB function is 200 characters.

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>x1=kupdateb(’感じのテスト’,1,6,’漢字’);</td>
<td>x1=漢字 テスト</td>
</tr>
<tr>
<td>x2=kupdateb(x1,1,6,’kanji’);</td>
<td>x2=kanji テスト</td>
</tr>
<tr>
<td>x3=kupdateb(x1,1,6);</td>
<td>x3=テスト</td>
</tr>
<tr>
<td>x4=kupdateb(x1,7,’かんじ’);</td>
<td>x4=漢字 かんじ</td>
</tr>
<tr>
<td>put x1= / x2= / x3= / x4=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

Function:
  ■ “KUPDATE Function” on page 462

KUPDATES Function

Inserts, deletes, and replaces character value contents.

Categories: CAS  DBCS

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

KUPDATES(argument,position,n<, characters-to-replace>)
KUPDATES(argument,position<n> , characters-to-replace)

Required Arguments

argument
specifies a character variable.

position
specifies a numeric expression that is the beginning character position.

Optional Arguments

n
specifies a numeric expression that is the length of the substring to be replaced.

Restrictions  

n cannot be larger than the length of the expression that remains in argument after position.

n is optional, but you cannot omit both n and characters-to-replace from the function.

Tip
If you omit n, SAS uses all of the characters in characters-to-replace to replace the values of argument.

characters-to-replace
specifies a character expression that replaces the contents of argument.

Restriction
characters-to-replace is optional, but you cannot omit both characters-to-replace and n from the function.

Tip
Enclose a literal string of characters in quotation marks.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The KUPDATES function replaces the value of argument with the expression in characters-to-replace. KUPDATES replaces n characters starting at the character that you specify in position.

If the KUPDATES function returns a value to a variable that has not yet been assigned a length, by default the variable is assigned a length of 200.

In the SQL procedure, or in a WHERE clause in any procedure, the maximum length of a word that is returned by the KUPDATES function is 200 characters.

Examples:

Example 1
The following example uses Japanese characters.
Example 2

The following example shows the difference between KUPDATE and KUPDATES.

```
data _null_;  
  x1=kupdates('感じのテスト',1,2,'漢字');  
  y1=kupdates(x1,1,2,'漢字');  
  z1=kupdates(x1,1,3);  
  x2=kupdates(x1,1,3,'テスト');  
  y2=kupdates(x2,1,3,'テスト');  
  z2=kupdates(x2,1,3);  
  x3=kupdates(x1,1,3,'Yahoo');  
  y3=kupdates(x3,1,3,'Yahoo');  
  z3=kupdates(x3,1,3);  
  put x1= / y1= / z1=;  
  x2= / y2= / z2=;  
  x3= / y3= / z3=;  
run;
```

### Results

<table>
<thead>
<tr>

See Also

**Functions:**

- "KUPDATE Function" on page 462

**KVERIFY Function**

Returns the position of the first character (character-based value) that is unique to an expression.

**Categories:**

- CAS
- DBCS

**Restriction:**

This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

\texttt{KVERIFY(source, excerpt-1, \ldots \texttt{excerpt-n})}

Required Arguments

\begin{itemize}
  \item \texttt{source} specifies any SAS character expression.
  \item \texttt{excerpt-1, \ldots \texttt{excerpt-n}} specifies any SAS character expression.
\end{itemize}

Tips

Enclose a literal string of characters in quotation marks.

If you specify more than one excerpt, separate them with a comma.

Details

See “Internationalization Compatibility for SAS String Functions” on page 341 for restrictions and more information.

The \texttt{KVERIFY} function returns the position of the first character in \texttt{source} that is not present in any \texttt{excerpt}. If \texttt{KVERIFY} finds every character in \texttt{source} in at least one \texttt{excerpt}, it returns a value of 0.

Example

The following example uses Japanese characters.

\begin{tabular}{|l|l|}
\hline
\textbf{Statements} & \textbf{Results} \\
\hline
data _null_;& invalid grade value: 可 \\
  input grade :$2. @@; & \\
  check='良否'; & \\
  x=kverify(grade,check); & \\
  if \ x \ gt \ 0 \ then \ put \ 'Invalid \ grade \ value: \ ' \ grade; & \\
  cards; & \\
  良 否 良 否 良 否 可 & \\
  ; & \\
\hline
\end{tabular}

\textbf{KVERIFYB Function}

Returns the position of the first character (byte-based value) that is unique to an expression.

Category: DBCS
Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

\texttt{KVERIFYB(source, excerpt-1, <excerpt-n>)}

Required Arguments

\textit{source} specifies any SAS character expression.

\textit{excerpt} specifies any SAS character expression.

\textbf{TIP} If you specify more than one excerpt, separate them with a comma.

Details

\texttt{KVERIFYB} returns the position of the first character in \textit{source} that is not present in any excerpt. If \texttt{KVERIFYB} finds every character in \textit{source} in at least one excerpt, it returns a 0.

Comparisons

\texttt{KVERIFYB} returns a byte-based value. \texttt{KVERIFY} returns a character-based value. When processing an SBCS string (for example, in the wlatin1 encoding), these functions return identical results. But, in a DBCS session (for example, EUC-JP or SHIFT-JIS encoding), most CJK characters are 2-byte width, which makes these functions return different results.

Example

The following example uses Japanese characters.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>; check=‘漢字’; text=‘漢字の検索’; x1=kverify(text,check); put x1=; x2=kverifyb(text,check); put x2=; run;</td>
<td>x1=3 x2=5</td>
</tr>
</tbody>
</table>
NLDATE Function

Converts the SAS date value to the date value of the specified locale by using the date format descriptors.

Syntax

```
NLDATE(date,descriptor)
```

Required Arguments

- **date**: specifies a SAS date value.
- **descriptor**: is a variable or expression that specifies how dates and times are formatted in output. The following descriptors are case sensitive:
  - `%#`: removes the leading zero from the result.
  - `%%%`: specifies the % character.
  - `%a`: specifies the short-weekday descriptor. The range for the day descriptor is Mon–Sun.
  - `%A`: specifies the long-weekday descriptor. The range for the long-weekday descriptor is Monday–Sunday.
  - `%b`: specifies the short-month descriptor. The range for the short-month descriptor is Jan–Dec.
  - `%B`: specifies the long-month descriptor. The range for the long-month descriptor is January–December.
  - `%C`: specifies the long-month descriptor and uses blank padding. The range for the long-month descriptor is January–December.
  - `%d`: specifies the day descriptor and uses 0 padding. The range for the day modifier is 01–31.
  - `%e`: specifies the day descriptor and uses blank padding. The range for the day descriptor is 01–31.
%F specifies the long-weekday descriptor and uses blank padding. The range for the day descriptor is Monday–Sunday.

%j specifies the day-of-year descriptor as a decimal number and uses a leading zero. The range for the day-of-year descriptor is 1–366.

%m specifies the month descriptor and uses 0 padding. The range for the month descriptor is 01–12.

%o specifies the month descriptor. The range for the month descriptor is 1–12 with blank padding.

%u specifies the weekday descriptor as a number in the range 1–7 that represents Monday–Sunday.

%U specifies the week-number-of-year descriptor by calculating the descriptor value as the SAS date value using the number of week within the year (Sunday is considered the first day of the week). The number-of-the-week value is represented as a decimal number in the range 0–53 and uses a leading zero and a maximum value of 53.

%V specifies the week-number-of-year descriptor by calculating the descriptor value as the SAS date value. The number-of-week value is represented as a decimal number in the range 01–53 and uses a leading zero and a maximum value of 53. Weeks begin on a Monday and week 1 of the year is the week that includes both January 4 and the first Thursday of the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year.

%w specifies the weekday descriptor as a number in the range 0–6 that represents Sunday–Saturday.

%W specifies the week-number-of-year descriptor by calculating the descriptor value as SAS date value by using the number of week within the year (Monday is considered the first day of the week). The number-of-week value is represented as a decimal number in the range 0–53 and uses a leading zero and a maximum value of 53.

%y specifies the year (2-digit) modifier. The range for the year descriptor is 00–99.

%Y specifies the year (4-digit) descriptor. The range for the year descriptor is 1970–2069.

Details

The NLDATE function converts the SAS date value to the date value of the specified locale by using the date descriptors.
Example

The following example shows a log filename that is created from a SAS date value.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English_Unitedstates;</td>
<td></td>
</tr>
<tr>
<td>logfile=nldate('24Feb2003'd,'%b-%d.log');</td>
<td>February-24.log</td>
</tr>
<tr>
<td>put logfile;</td>
<td></td>
</tr>
<tr>
<td>options locale=German_Germany;</td>
<td>Februar-24.log</td>
</tr>
<tr>

NLDATM Function

Converts the SAS datetime value to the time value of the specified locale by using the datetime-format descriptors.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

\textbf{NLDATM}(\textit{datetime,descriptor})

Required Arguments

\textit{datetime}

specifies a SAS datetime value.

\textit{descriptor}

is a variable or expression that specifies how dates and times are formatted in output. The following descriptors are case sensitive:

#

removes the leading zero from the result.

%%

specifies the \% character.

\%

\textit{a}

specifies the short-weekday descriptor. The range for the day descriptor is Mon–Sun.

\%A

specifies the long-weekday descriptor. The range for the long-weekday descriptor is Monday–Sunday.

\%b

specifies the short-month descriptor. The range for the short-month descriptor is Jan–Dec.

\%B

specifies the long-month descriptor. The range for the long-month descriptor is January–December.

\%c

specifies the long-month descriptor and uses blank padding. The range for the long-month descriptor is January–December.

\%d

specifies the day descriptor and uses 0 padding. The range for the day descriptor is 01–31.

\%e

specifies the day descriptor and uses blank padding. The range for the day descriptor is 01–31.

\%F

specifies the long-weekday descriptor and uses blank padding. The range for the day descriptor is Monday–Sunday.

\%H

specifies the hour descriptor that is based on a 24-hour clock. The range for the hour descriptor is 00–23.

\%I

specifies the hour descriptor that is based on a 12-hour clock. The range for the hour descriptor is 01–12.

\%j

specifies the day-of-year descriptor as a decimal number and uses a leading zero. The range for the day-of-year descriptor is 1–366.
%m
specifies the month descriptor and uses 0 padding. The range for the month descriptor is 01–12.

%M
specifies the minute descriptor. The range for the minute descriptor is 00–59.

%o
specifies the month descriptor and uses blank padding. The range for the month descriptor is 1–12.

%p
specifies a.m. or p.m. descriptor.

%S
specifies the second descriptor. The range for the second descriptor is 00–59.

%u
specifies the weekday descriptor as a number in the range of 1–7 that represents Monday–Sunday.

%U
specifies the week-number-of-year descriptor by calculating the descriptor value as the SAS date value and uses the number-of-week value within the year (Sunday is considered the first day of the week). The number-of-week value is represented as a decimal number in the range 0–53. A leading zero and a maximum value of 53 is used.

%V
specifies the week-number-of-year descriptor by calculating the descriptor value as the SAS date value. The number-of-week value is represented as a decimal number in the range 01–53. A leading zero and a maximum value of 53 is used. Weeks begin on a Monday and week 1 of the year is the week that includes both January 4 and the first Thursday of the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year.

%w
specifies the weekday descriptor as a number in the range of 0–6 that represents Sunday–Saturday.

%W
specifies the week-number-of-year descriptor by calculating the descriptor value as SAS date value using the number of week within the year (Monday is considered the first day of the week). The number-of-week value is represented as a decimal number in the range of 0–53. A leading zero and a maximum value of 53 are used.

%y
specifies the year (2-digit) descriptor. The range for the year descriptor is 00–99.

%Y
specifies the year (4-digit) descriptor. The range for the year descriptor is 1970–2069.

Details
The NLDATM function converts the SAS datetime value to the datetime value of the specified locale by using the datetime descriptors.
Example

The following example shows a time (a.m or p.m.) that is created from a SAS datetime value.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----+----1----+</td>
<td></td>
</tr>
<tr>
<td>options locale=English;</td>
<td>12PM</td>
</tr>
<tr>
<td>time_ampm=nldatm('24Feb2003:12:39:43'dt,'%I%p');</td>
<td></td>
</tr>
<tr>
<td>put time_ampm;</td>
<td></td>
</tr>
</tbody>
</table>

| options locale=German; | 12nachm |
| time_ampm=nldatm('24Feb2003:12:39:43'dt,'%I%p'); |  |
| put time_ampm; |  |

NLTIME Function

Converts the SAS time or the datetime value to the time value of the specified locale by using the NLTIME descriptors.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

NLTIME(time|datetime,descriptor,startpos)

Required Arguments

time

specifies a SAS time value.

datetime

specifies a SAS datetime value.

descriptor

is a variable, or expression, that specifies the value of a descriptor. You can enter the following descriptors in uppercase or lowercase:
removes the leading zero from the result.

%% specifies the % character.

%H specifies the hour descriptor that is based on a 24-hour clock. The range for the hour descriptor is 00–23.

%I specifies the hour descriptor that is based on a 12-hour clock. The range for the hour descriptor is 01–12.

%M specifies the minute modifier. The range for the minute descriptor is 00–59.

%P specifies the a.m. or p.m. descriptor.

%S specifies the second descriptor. The range for the second descriptor is 00–59.

**startpos**

is an integer that specifies the position at which the search should start and that specifies the direction of the search.

Details

The NLTIME function converts a SAS time or datetime value to the time value of the specified locale by using the time descriptors.

Example

The following example shows an a.m. or p.m. time that is created from a SAS time.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English;</td>
<td>12PM</td>
</tr>
<tr>
<td>time_ampm=nltime('12:39:43't,'%i%p');</td>
<td></td>
</tr>
<tr>
<td>put time_ampm;</td>
<td></td>
</tr>
<tr>
<td>options locale=German;</td>
<td>12nachm</td>
</tr>
<tr>
<td>time_ampm=nltime('12:39:43't,'%i%p');</td>
<td></td>
</tr>
<tr>
<td>put time_ampm;</td>
<td></td>
</tr>
</tbody>
</table>

**Format:**

- "NLTIMEw. Format" on page 294
SASMSG Function

Specifies a message from a data set. The returned message is based on the current locale and a specified key.

Syntax

SASMSG (BASENAME", "KEY", "QUOTE"|"DQUOTE"|"NOQUOTE">
<, "substitution 1", ..., "substitution 7">)

Required Arguments

BASENAME
the name of the data set where the message is located.

KEY
the message key.

Note: If you specify an invalid key name, then the key name is returned.

QUOTE|DQUOTE|NOQUOTE
specifies the type of quotation marks that are added to the message text and substitution strings.

Default DQUOTE

substitution
string substitutions. The maximum string substitutions is 7.

Details

The SAS message data set must be a 7-bit ASCII data set. Any character that cannot be represented in the 7-bit ASCII encoding is represented in the Unicode escape format of \uxxxx, where 'xxxx' is the base 10 numeric representation of the Unicode value of the character.

The data set used by the SASMSG function must have been created specifically for use with this function. The data set must contain the following variables:

<table>
<thead>
<tr>
<th>#</th>
<th>Variable Name</th>
<th>Type</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>locale</td>
<td>char</td>
<td>5</td>
<td>language of the message</td>
</tr>
</tbody>
</table>
The data set must be sorted on the following variables: locale, key, and lineno. The variable lineno must be in descending order. A composite index on locale and key must be defined. Here is a sample program to sort and create an indexed data set:

```
%let basename=MyProduct;
proc sort data=t.&basename;
by locale key descending lineno;
run;
proc datasets lib=t
memtype=data;
modify &basename;
index create indx=(LOCALE KEY);
run;
quit;
```

The returned message is based on the LOCALE system option. The LOCALE option is represented by $l_RR$ where $l$ represents the two-letter language code and RR represents the two-letter region code. If a match is not found, then the function searches for a match with the language only. If the pair locale and key are still not found, then the function defaults to the English language (en). If the key does not exist for English (en), then the key name is returned.

You can alter formatting. You can use string substitution by using the format code %s. You can change the order of substitution. In some cases, translation of a message to a language other than English might require changing the order of substitutions. You can change the order by placing an argument number specification, #nn, within a format string, where nn is the number of the argument in the substitution list. The following example demonstrates the order:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>msg = sasmsg(&quot;nls.mymsg&quot;,&quot;IN_CD_LOG&quot;,&quot;noquote&quot;,&quot;cat&quot;,&quot;dog&quot;);</code></td>
<td><code>msg= My cat. Your dog.</code></td>
</tr>
<tr>
<td><code>IN_CD_LOGINFO = My %#1s. Your %#2s</code></td>
<td><code>msg= My dog. Your cat.</code></td>
</tr>
<tr>
<td><code>IN_CD_LOGINFO = My %#2s. Your %#1s</code></td>
<td></td>
</tr>
</tbody>
</table>

The SASMSG function can be used in the open code macro with the %SYSFUNC macro function.
Arguments that are passed to a function called by the %SYSFUNC macro must not be in quotation marks. Arguments passed to the SASMSG function outside of %SYSFUNC must be quoted.

When the SASMSG function is used with the %SYSFUNC macro function, the returned string is wrapped with the %NRBQUOTE function.

Examples:

Example 1
The following example demonstrates the formatting feature of SASMSG:

```sas
%macro demo_sasmsg;
data _null_;  
  msg = sasmsg("nls.mymsg","IN_APW_SAVE_OK","noquote");  
  put msg=;  
run;  
%mend demo_sasmsg;
```

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale = en_US;</td>
<td>msg=The Access Control key was successfully saved.</td>
</tr>
<tr>
<td>%demo_sasmsg;</td>
<td></td>
</tr>
<tr>
<td>options locale = es_ES;</td>
<td>msg=La clave de control de acceso se ha guardado.</td>
</tr>
<tr>
<td>%demo_sasmsg;</td>
<td></td>
</tr>
<tr>
<td>options locale = french_France;</td>
<td>msg=La clé de contrôle d'accès a bien été enregistrée.</td>
</tr>
<tr>
<td>%demo_sasmsg;</td>
<td></td>
</tr>
</tbody>
</table>

Example 2
The following example demonstrates the open macro feature:

```sas
%MACRO PRT(loc,tb,key);
  option locale=&loc;
  %PUT %SYSFUNC(SASMSG(&tb,&key) );
%mEND PRT;
```

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>%PRT(en_US,&amp;TABLEID,IN_EDIT)</td>
<td>&quot;Edit&quot;</td>
</tr>
<tr>
<td>%PRT(es_ES,&amp;TABLEID,IN_EDIT)</td>
<td>&quot;Editar&quot;</td>
</tr>
<tr>
<td>%PRT(fr_FR,&amp;TABLEID,IN_EDIT)</td>
<td>&quot;Modifier&quot;</td>
</tr>
</tbody>
</table>
SASMSGL Function

Specifies a message from a data set. The message is based on a specified locale value and a specified key value.

Category: Locale

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

```
SASMSGL("BASENAME", "KEY", "LOCALE", (, , <<"Q"|"D"|"N">
<, "substitution 1", ..., "substitution 6">))
```

Required Arguments

**BASENAME**

the name of the data set where the message is located.

**KEY**

the message key.

**Note:** If you specify an invalid key name, then the key name is returned.

**LOCALE**

the posix locale value (ll_RR).

**QUOTE|DQUOTE|NOQUOTE**

specifies the type of quotation marks that are added to the message text and substitution strings.

**Default** DQUOTE

**substitution**

string substitutions. The maximum string substitutions is 6.

Details

The SAS message data set must be a 7-bit ASCII data set. Any character that cannot be represented in the 7-bit ASCII encoding is represented in the Unicode escape format of \\uxxxx, where the xxxx is the base 10 numeric representation of the Unicode value of the character.

The data set used by SASMSGL function must have been created specifically for use with this function. The data set must contain the following variables:
<table>
<thead>
<tr>
<th>#</th>
<th>Variable Name</th>
<th>Type</th>
<th>Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>locale</td>
<td>char</td>
<td>5</td>
<td>language of the message</td>
</tr>
<tr>
<td>2</td>
<td>key</td>
<td>char</td>
<td>60</td>
<td>key to identify the message</td>
</tr>
<tr>
<td>3</td>
<td>lineno</td>
<td>num</td>
<td>5</td>
<td>line number of the message in reverse order</td>
</tr>
<tr>
<td>4</td>
<td>text</td>
<td>text</td>
<td>1200</td>
<td>text of the message</td>
</tr>
</tbody>
</table>

The data set must be sorted on the following variables: `locale`, `key`, and `lineno`. The variable `lineno` must be in descending order. A composite index on locale and key must be defined. Here is a sample program to sort and create an indexed data set:

```sas
%let basename=MyProduct;
proc sort data=t.&basename;
    by locale key descending lineno;
run;
proc datasets lib=t
    memtype=data;
    modify &basename;
    index create indx=(LOCALE KEY);
run;
quit;
```

The returned message is based on the LOCALE system option. The LOCALE option is represented by `ll_RR` where `ll` represents the two-letter language code and RR represents the two-letter region code. If a match is not found, then the function searches for a match with the language only. If the pair locale and key are still not found, then the function defaults to the English language (en). If the key does not exist for English (en), then the key name is returned.

You can alter formatting. You can use string substitution by using the format code `%s`. You can change the order of substitution. In some cases, translation of a message to a language other than English might require changing the order of substitutions. You can change the order by placing an argument number specification, `#nn`, within a format string, where `nn` is the number of the argument in the substitution list. The following example demonstrates changing the order:

```
Statement                                Result

msg = sasmsgl                             msg= My cat. Your dog.
("nls.mymsg","IN_CD_LOG","en_US","N",
"cat","dog");                         
IN_CD_LOGINFO = My %#1s. Your %#2s       

IN_CD_LOGINFO = My %#2s. Your %#1s       msg= My dog. Your cat.
```

SASMSGL Function 481
The SASMSGL function can be used in the open code macro with the %SYSFUNC macro function.

Arguments that are passed to a function called by the %SYSFUNC macro must not be in quotation marks. Arguments passed to the SASMSGL function outside of %SYSFUNC must be quoted.

When the SASMSGL function is used with the %SYSFUNC macro function, the returned string is wrapped with the %NRBQUOTE function.

Examples:

Example 1
The following example demonstrates the formatting feature of SASMSGL:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>sasmsgl(&quot;nls.mymag&quot;, &quot;IN_APW_SAVE_OK&quot;, &quot;en_US&quot;, &quot;n&quot;)</td>
<td>The Access Control key was successfully saved.</td>
</tr>
<tr>
<td>sasmsgl(&quot;nls.mymag&quot;, &quot;IN_APW_SAVE_OK&quot;, &quot;es_ES&quot;, &quot;n&quot;)</td>
<td>La clave de control de acceso se ha guardado.</td>
</tr>
<tr>
<td>sasmsgl(&quot;nls.mymag&quot;, &quot;IN_APW_SAVE_OK&quot;, &quot;fr&quot;, &quot;n&quot;)</td>
<td>La clé de contrôle d'accès a bien été enregistrée.</td>
</tr>
</tbody>
</table>

Example 2
The following example demonstrates the open macro feature:

<table>
<thead>
<tr>
<th>SAS Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>%PUT %SYSFUNC(SASMSGL(NLS.MYDS, IN_ASD_LABEL, en_US));</td>
<td>&quot;Edit&quot;</td>
</tr>
<tr>
<td>%PUT %SYSFUNC(SASMSGL(NLS.MYDS, IN_ASD_LABEL, es_ES));</td>
<td>&quot;Editar&quot;</td>
</tr>
<tr>
<td>%PUT %SYSFUNC(SASMSGL(NLS.MYDS, IN_ASD_LABEL, fr));</td>
<td>&quot;Modifier&quot;</td>
</tr>
</tbody>
</table>

SETLOCALE Function
Specifies the locale keys for the current SAS locale.

Category: Locale
Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

Setting SAS Locale

**SETLOCALE** *(sas_locale)*

Customize single locale elements

**SETLOCALE** *(key,value)*

Customize single locale elements

**SETLOCALE** *(category_name, sas_locale)*

Required Arguments

**sas_locale**

specifies a SAS locale name by using the SAS name or the posix name. You can also specify the locale alias.

**key**

specifies a SAS locale element key. See the list of element keys in the Details section.

**value**

specifies a value for the locale element.

**category_name**

specifies the category name:

- **LC_TIME**
- **LC_MONETARY**
- **LC_NUMERIC**
- **LC_ALL**

Details

You can modify the following locale elements. The value of *key* must be less than the value of *max length*. You can specify the following values for *type*:

- 0 String.
- 1 Unsigned integer. You must use double quotation marks.

<table>
<thead>
<tr>

Examples:

Example 1
In the following locale example, the SETLOCALE function specifies the locale Japanese (ja_JP). The SETLOCALE function returns the previous locale. In this example, the previous locale was English_United States.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>x=setlocale('ja_JP');</td>
<td>x=English_UnitedStates</td>
</tr>
<tr>
<td>put x=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

Example 2
In the following example, the SETLOCALE function returns the locale name where the element values are being changed:
Example 3

In the following example, the SETLOCALE function changes the value of the specified key, DATE_YEAR_FORMAT:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>x=Japanese_Japan</td>
</tr>
<tr>
<td>x = setlocale(&quot;LC_MONETARY&quot;, 'zh_CN');</td>
<td></td>
</tr>
<tr>
<td>put x=; run;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>x=%Y¥</td>
</tr>
<tr>
<td>x=setlocale('DATE_YEAR_FORMAT', '¥¥');</td>
<td></td>
</tr>
<tr>
<td>put x=; run;</td>
<td></td>
</tr>
</tbody>
</table>

**SORTKEY Function**

Creates a linguistic sort key.

**Category:** Locale

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see *Internationalization Compatibility* on page 341.

**Syntax**

```
sortKey(string, <locale, strength, case_order, numeric_order,> )
```

**Required Arguments**

- `string` character expression
- `locale` specifies the locale name in the form of a POSIX name (ja_JP). See Table 21.1 on page 809 for a list of locale names and POSIX values.
- `strength` The value of strength is related to the collation level. There are five collation-level values. The following table provides information about the five levels. The default value for strength is related to the locale.

<table>
<thead>
<tr>
<th>Value</th>
<th>Type of Collation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- `case_order` Specifies the case sensitivity of collation. There are two case sensitivity levels. The following table provides information about the two levels.

<table>
<thead>
<tr>
<th>Value</th>
<th>Type of Case Sensitivity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- `numeric_order` Specifies the numeric sensitivity of collation. There are two numeric sensitivity levels. The following table provides information about the two levels.

<table>
<thead>
<tr>
<th>Value</th>
<th>Type of Numeric Sensitivity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIMARY or P</td>
<td>PRIMARY specifies differences between base characters (for example, &quot;a&quot; &lt; &quot;b&quot;).</td>
<td>It is the strongest difference. For example, dictionaries are divided into different sections by base character.</td>
</tr>
<tr>
<td>SECONDARY or S</td>
<td>Accents in the characters are considered secondary differences (for example, &quot;as&quot; &lt; &quot;às&quot; &lt; &quot;at&quot;).</td>
<td>Other differences between letters can also be considered secondary differences, depending on the language. A secondary difference is ignored when there is a primary difference anywhere in the strings.</td>
</tr>
<tr>
<td>TERTIARY or T</td>
<td>Upper and lowercase differences in characters are distinguished at the tertiary level (for example, &quot;ao&quot; &lt; &quot;Ao&quot; &lt; &quot;aö&quot;).</td>
<td>An example is the difference between large and small Kana. A tertiary difference is ignored when there is a primary or secondary difference anywhere in the strings.</td>
</tr>
<tr>
<td>QUATERNARY or Q</td>
<td>When punctuation is ignored at level 1-3, an additional level can be used to distinguish words with and without punctuation (for example, &quot;ab&quot; &lt; &quot;a-b&quot; &lt; &quot;aB&quot;).</td>
<td>This difference is ignored when there is a primary, secondary, or tertiary difference. The quaternary level should be used if ignoring punctuation is required or when processing Japanese text.</td>
</tr>
<tr>
<td>IDENTICAL or I</td>
<td>When all other levels are equal, the identical level is used as a tiebreaker. The Unicode code point values of the NFD form of each string are compared at this level, just in case there is no difference at levels 1-4.</td>
<td>For example, only Hebrew cantillation marks are distinguished at this level. This level should be used sparingly, as only code point values differences between two strings is an extremely rare occurrence.</td>
</tr>
</tbody>
</table>

**case order**

Sorts uppercase and lowercase letters. This argument is valid for only TERTIARY, QUATERNARY, or IDENTICAL. The following table provides the values and information for the case order argument.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPPER or U</td>
<td>Sorts uppercase letters first, then the lowercase letters.</td>
</tr>
<tr>
<td>LOWER or L</td>
<td>Sorts lowercase letters first, then the uppercase letters.</td>
</tr>
</tbody>
</table>
**numeric order**

orders numbers by the numeric value instead of the number's characters.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMERIC or N</td>
<td>Order numbers (integers) by the numeric value. For example, &quot;8 Main St.&quot; would sort before &quot;45 Main St.&quot;.</td>
</tr>
</tbody>
</table>

**collation order**

There are two types of collation values: Phonebook and Traditional. If you do not select a collation value, then the user's locale-default collation is selected. The following table provides more information.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PHONEBOOK or P</td>
<td>specifies a phonebook style ordering of characters. Select <code>PHONEBOOK</code> only with the German language.</td>
</tr>
<tr>
<td>TRADITIONAL or T</td>
<td>specifies a traditional style ordering of characters. Select <code>TRADITIONAL</code> only with the Spanish language.</td>
</tr>
</tbody>
</table>

**Details**

The `SORTKEY` function creates a linguistic sort key for data. You must enter at least one argument. If the length of the variable that receives the key is not large enough, the data truncates, and a warning is displayed.

**locale**

Locale values use the POSIX name (ll_RR). LL represents the two-letter language code, and RR represents the two-letter region code. For example, en.US is the POSIX name for English, United States. en represents the English language, and US represents the United States. If a locale value is not specified, then the session locale is used.

**strength**

The strength argument determines whether accents or case affect collating or matching text. If no value is specified for strength, then the locale determines the value. The following values can be specified for strength.

- **PRIMARY**
  This value includes base letters. An example is the letters, A, a, and Å are all processed the same.

- **SECONDARY**
  This value processes data the same as PRIMARY, and accents are processed. The letters A and a are processed equally, and Å is processed as an accented character.

- **TERTIARY**
  This value processes data the same as SECONDARY, and the character's case is processed. For example, A, a, and Å are all processed differently.

- **QUATERNARY**
  This value processes data the same as TERTIARY, and punctuation is processed.
IDENTICAL
This value process data the same as QUATERNARY, and code point is processed.

case order
specifies to sort data using uppercase or lowercase letter. The following table shows examples of specifying the UPPER value or the LOWER value.

<table>
<thead>
<tr>
<th>UPPER</th>
<th>LOWER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aztec</td>
<td>aztec</td>
</tr>
<tr>
<td>aztec</td>
<td>Aztec</td>
</tr>
<tr>
<td>Mars</td>
<td>mars</td>
</tr>
<tr>
<td>mars</td>
<td>Mars</td>
</tr>
</tbody>
</table>

collation order
The collation order value PHONEBOOK is ignored unless the locale is a German language.

The collation order value TRADITIONAL is ignored unless the locale is a Spanish language.
A warning message is displayed for other locales.

TZONEID Function

Returns the current time zone ID.

Category: Date and Time
Alias: TZID
Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax
TZONEID<time-zone-id>

Optional Argument
time-zone-id
specifies a region/area value that is defined by SAS. When you specify a zone ID, the time zone that SAS uses is determined by the time zone name and daylight savings time rules.
Details

The `TZONEID` function returns a blank value if the `TIMEZONE=` option is blank or a user-defined time zone is specified.

The `TZONEID` function validates the timezone ID. If you specify the timezone ID, the function returns the timezone ID if it is valid or returns a blank value if the ID is invalid.

Example

In the first example, the `TIMEZONE` option is set to JST. In the second example, `TIMEZONE` is set to a blank value. In the third example `TIMEZONE` is set to user-specified time zone. In the fourth example a valid timezoneid and an invalid timezoneid is displayed.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options timezone='jst';</td>
<td>tzid=ASIA/TOKYO</td>
</tr>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>put tzid=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>options timezone='xxx-12';</td>
<td>tzid=ETC/GMT-12</td>
</tr>
<tr>
<td>/* user defined time zone */</td>
<td></td>
</tr>
<tr>
<td>data <em>null</em>;</td>
<td></td>
</tr>
<tr>
<td>tzid=tzoneid();</td>
<td></td>
</tr>
<tr>
<td>put tzid=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>data null;</td>
<td>name_valid=ASIA/TOKYO</td>
</tr>
<tr>
<td>name_valid=tzoneid('asia/tokyo');</td>
<td></td>
</tr>
<tr>
<td>name_invalid=tzoneid('Milky Way');</td>
<td></td>
</tr>
<tr>
<td>put name_valid =;</td>
<td></td>
</tr>
<tr>
<td>put name_invalid =;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

TZONENAME Function

Returns the current standard or daylight savings time, time zone name.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

TZONENAME()

TZONENAME<time-zone-id,datetime>

Optional Arguments

time-zone-id

specifies a region/area value that is defined by SAS. When you specify a zone ID, the time zone that SAS uses is determined by time zone name and daylight savings time rules.

See For a list of the time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

datetime

specifies a SAS datetime value.

Details

The TZONENAME function returns a blank value if the TIMEZONE= option and the time-zone-id argument are blank.

The TZONENAME function returns the timezone name based on the specified timezone and datetime. If the SAS datetime is not specified, then the current date is used. If time-zone-id is not specified, then the timezone ID that is specified with the TIMEZONE= option is used.

Example

In the first example, the TIMEZONE option is set to a blank value. In the second example, TIMEZONE is set to timezone name, JST. In the third example, TIMEZONE is set to a user-specified time zone. In the fourth example, TIMEZONE is set to a time zone ID.

<table>

<td></td>
</tr>
</tbody>
</table>
Statements | Results
--- | ---
options tz='America/Chicago'; | tzone=CDT
data _null_; | 
  tzname=tzonename('01SEP2014:01:01:01'dt);
  put tzname =;
run;

TZONEOFF Function

Returns the user time zone offset.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

TZONEOFF()

TZONEOFF(<time-zone-id, datetime>)

Optional Arguments

time-zone-id

specifies a region/area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by time zone name and daylight savings time rules.

See For a list of time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

datetime

specifies a SAS datetime value.

Details

If no arguments are specified, the TZONEOFF function returns the time zone offset for the specified TIMEZONE option. The TZONEOFF (time-zone-id) function with the time zone ID argument returns the time zone offset for the specified time zone ID. The TZONEOFF function with the time zone ID name returns the time zone offset for the specified time zone name. We recommend that you use the time zone ID, since it is not locale dependent.

If SASDSTM is not provided, TZONEOFF returns the current timezone offset. If SASDSTM is provided, it returns the offset to get the local time for specified time value.
Example

The first example has no argument, so the TZONEOFF function returns an offset for the current SAS session. The second example returns an offset based on a specific time zone ID. The third example returns an offset based on a specific time zone ID and a specific date and time. The fourth example returns an offset based on the Time Zone option and a specific date.

If the SAS datetime is not specified, then the TZONEOFF function returns the current timezone offset. If the SAS datetime is specified, then the function returns the offset to provide the local time for the specified time value.

<table>

TZONES2U Function

Converts a SAS date time value to a UTC date time value.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

TZONES2U <datetime, time-zone-id>
Required Argument

**datetime**
specifies a SAS datetime value.

Optional Argument

**time-zone-id**
specifies a region/area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by time zone name and daylight savings time rules.

See For a list of time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951

Details

The TZONE2U() function returns UTC-based time for the specified TIMEZONE. The TZONE2U(time-zone-id) function with the time zone ID argument returns UTC-based time for the specified time zone ID. If the time zone name is not valid for the current locale, you receive an error. If time-zone-id is not specified, then the timezone ID that is specified with the TIMEZONE= option is used.

Example

The following example converts a SAS date time into UTC time.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>option locale=ja_JP TZ='JST' ;</td>
<td>dt=1667722672</td>
</tr>
<tr>
<td>data <em>null</em> ;</td>
<td></td>
</tr>
<tr>
<td>dt='05Nov2012:08:17:52' dt ;</td>
<td>utc1=2012-11-04T23:17:52+00:00</td>
</tr>
<tr>
<td>utc1 = tzones2u(dt) ;</td>
<td></td>
</tr>
<tr>
<td>utc2 = tzones2u(dt,'ASIA/TOKYO') ;</td>
<td>dt=1667722672</td>
</tr>
<tr>
<td>utc3 = tzones2u(dt, 'JST') ;</td>
<td>utc2=2012-11-04T23:17:52+00:00</td>
</tr>
<tr>
<td>put dt= /utc1= is8601dz. // ;</td>
<td></td>
</tr>
<tr>
<td>put dt= /utc2= is8601dz. // ;</td>
<td></td>
</tr>
<tr>
<td>put dt= /utc3= is8601dz. // ;</td>
<td>dt=1667722672</td>
</tr>
<tr>
<td>run ;</td>
<td>utc3=2012-11-04T23:17:52+00:00</td>
</tr>
</tbody>
</table>

TZONEDSTNAME Function

Returns a daylight savings time name.

Category: Date and Time

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.
Syntax

TZONEDSTNAME()
TZONEDSTNAME<time-zone-id>

Optional Argument

time-zone-id
specifies a region/area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by the time zone name and daylight savings time rules.

Details

If the time-zone-id is not specified, then the TIMEZONE ID that is specified by the TIMEZONE= option is used. If the daylight savings time does not exist for the specified time zone, then the function returns a blank name.

Example

The following example specifies the America/Chicago time zone.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>

</table>

TZONEDSTOFF Function

Returns the time zone offset value for the specified daylight savings time.

Category: Date and Time
Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

TZONEDSTOFF()
TZONEDSTOFF<time-zone-id>
Optional Argument

**time-zone-id**

specifies a region/area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by the time zone name and daylight savings time rules.

Details

If the time-zone-id is not specified, then the TIMEZONE ID that is specified by the TIMEZONE option is used. If the daylight savings time does not exist for the specified time zone, then the function returns a blank name.

Example

The following example specifies the America/Chicago time zone.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options timezone='America/Chicago';</td>
<td>dstoff=18000</td>
</tr>
<tr>
<td>data null;</td>
<td></td>
</tr>
<tr>
<td>dstoff=tzonedstoff();</td>
<td></td>
</tr>
<tr>
<td>put dstoff;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

TZONESTTNAME Function

Returns a standard time zone name.

<table>
<thead>
<tr>
<th>Category:</th>
<th>Date and Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restriction:</td>
<td>This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.</td>
</tr>
</tbody>
</table>

Syntax

TZONESTTNAME()
TZONESTTNAME<time-zone-id>

Optional Argument

**time-zone-id**

specifies a region or area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by the time zone name and daylight savings time rules.
Details
If the TZID is not specified, then the TIMEZONE ID that is specified by the
TIMEZONE= option is used.

Example
The following example specifies the Asia/Osaka time zone.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options timezone='Asia/Osaka';</td>
<td>JST</td>
</tr>
<tr>
<td>data null;</td>
<td></td>
</tr>
<tr>
<td>name=tzonesttname();</td>
<td></td>
</tr>
<tr>
<td>put name;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

TZONESTTOFF Function

Returns the time zone offset value for the specified standard time.

Category:        Date and Time
Restriction:     This function is assigned an I18N Level 2 status and designed for use with SBCS,
                 DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility
                 on page 341.

Syntax
TZONESTTOFF()
TZONESTTOFF<time-zone id>

Optional Argument
time-zone-id
specifies a region or area value that is defined by SAS. When you specify a time
zone ID, the time zone that SAS uses is determined by the time zone name and
daylight savings time rules.

Details
If the time-zone-id is not specified, then the TIMEZONE ID that is specified by the
TIMEZONE= option is used. If standard time is not specified, then the function
returns a blank name.

Example
The following example specifies the Asia/Osaka time zone.
Statements | Results
--- | ---
```options timezone='Asia/Osaka';
data null;
   name=tzonesttoff();
   put name;
run;```

### TZONEU2S Function
Converts a UTC date time value to a SAS date time value.

**Category:** Date and Time  
**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see [Internationalization Compatibility](#) on page 341.

**Syntax**

```
TZONEU2S <UTC date time value, time-zone id>
```

**Required Argument**

*UTC date time value*

specifies a Coordinated Universal Time (UTC) datetime value

**Optional Argument**

*time-zone-id*

specifies a region/area value that is defined by SAS. When you specify a zone ID, the time zone that SAS uses is determined by the time zone name and daylight savings time rules.

**Details**

The TZONEU2S(datetime) function returns the SAS datetime for a UTC time for the specified TIMEZONE option. The TZONEU2S(datetime, time-zone-id) function with the time zone ID argument, returns the SAS datetime for the UTC time for the specified time zone ID.

**Example**

The following example converts a UTC date time to three specific SAS date time values.
### TRANTAB Function

Transcodes data by using the specified translation table.

**Category:** Character

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see *Internationalization Compatibility on page 341*.

#### Syntax

TRANTAB(*string*, *trantab_name*)

#### Required Arguments

- **string**
  - input data that is transcoded.

- **trantab_name**
  - translation table.

#### Details

The TRANTAB function transcodes a data string by using a translation table to remap the characters from one internal representation to another. The encoding of the data in the input string must match the encoding of table 1 in the translation table. The TRANTAB function remaps the data from the encoding using table 1.

Translation tables were introduced in SAS 6 to support the requirements of national languages. SAS 8.2 introduced the LOCALE= and ENCODING= system options as an improvement on direct use of translation tables. In SAS 9 translation tables are used only for transcoding external files. There is direct transcoding in SAS files, between the session encodings. SAS 9.2 supports the TRANTAB function for backward compatibility.

The LOCALE= system option is preferred in later SAS releases.

---

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>option locale=fr_FR TZ='AMERICA/DENVER'; data <em>null</em>;         utc_date = '2012-09-02T02:34:56+00:00'; udt = input(utc_date,is8601dz.); sdt1 = tzoneu2s(udt); sdt2 = tzoneu2s(udt,'EUROPE/AMSTERDAM'); sdt3 = tzoneu2s(udt,'CET'); put sdt1= datetime. / sdt2= datetime. / sdt3= datetime.; run;</td>
<td>sdt1=01SEP12:20:34:56 sdt2=02SEP12:04:34:56 sdt3=02SEP12:03:34:56</td>
</tr>
</tbody>
</table>
Only experienced SAS users should use the TRANTAB function.

Example

The following example uses a translation table that transcodes data that is encoded in Latin2 to an uppercase Latin2 encoding:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>teststrg=trantab('testing','lat2_ucs');</td>
<td>TESTING</td>
</tr>
<tr>
<td>put teststrg;</td>
<td></td>
</tr>
</tbody>
</table>

**Procedures:**
- Chapter 20, "TRANTAB Procedure," on page 781

---

**UNICODE Function**

Converts Unicode characters to the current SAS session encoding.

**Category:** Character

**Restriction:** This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

**Syntax**

\[
\text{STR} = \text{UNICODE}(\text{<instr>}, (\text{<Unicode type> } ))
\]

**Required Argument**

\[
\text{str}
\]

Data string that has been converted to the current SAS session encoding.

**Optional Arguments**

\[
\text{instr}
\]

Input data string.

\[
\text{Unicode type}
\]

Unicode character formats

- **ESC** \(\text{Unicode Escape (for example, \u0042 )}\). ESC is the default format.
- **NCR** \(\text{Numeric Character Representation (for example, \&\#22823 or \&\#177 ; )}\)
Details

This function reads Unicode characters and converts them to the current SAS session encoding.

The Unicode function supports the Unicode supplementary characters.

Example

The following example demonstrates the functionality of the UNICODE function:

```sas
/* Run this program using any CJK LOCALE */
data _null_;  
str1=unicode("\u0041\u0042\u0043");put str1=;          /* default */  
str2=unicode("\u0041\u0042\u0043", "esc");put str2=;   /* ESC - Unicode Escape */  
str3=unicode("\&#177;", "ncr");put str3=;               /* NCR - Numeric Character Representation */  
str4=unicode("\&#22823;", "ncr");put str4=;             /* NCR - Numeric Character Representation */  
str5=unicode('＜\u0061\u0062>', 'paren');put str5=;     /* PAREN - Unicode Parenthesis Escape */  
str6=unicode('2759'x, 'ucs2');put str6=;               /* UCS2 - UCS2 encoding */  
str7=unicode('5927'x, 'ucs2b');put str7=;              /* UCS2B - UCS2 encoding with big endian */  
str8=unicode('2759'x, 'ucs2l');put str8=;              /* UCS2L - UCS2 encoding with little endian */  
str9=unicode('27590000'x,'ucs4');put str9=;            /* UCS4 - UCS4 encoding */  
str10=unicode('00005927'x,'ucs4b');put str10=;         /* UCS4B - UCS4 encoding with big endian */  
str11=unicode('27590000'x,'ucs4l');put str11=;         /* UCS4L - UCS4 encoding with little endian */  
str12=unicode('E5A4A7'x, 'utf8');put str12=;            /* UTF8 - UTF8 encoding */  
str13=unicode('2759'x, 'utf16');put str13=;             /* UTF16 - UTF16 encoding */  
str14=unicode('5927'x,'utf16b');put str14=;            /* UTF16B - UTF16 encoding with big endian */  
str15=unicode('2759'x,'utf16l');put str15=;            /* UTF16L - UTF16 encoding with little endian */  
str16=unicode("\u00020bb7", "esc");put str16=;         /* ESC - Unicode Escape for Supplementary Character */  
str17=unicode("\&#134071;", "ncr");put str17=;         /* NCR - Numeric Character Representation for Supplementary Character */  
str18=unicode('＜\u00020BB7>', 'paren');put str18=;     /* PAREN - Unicode Parenthesis Escape for Supplementary Character */  
run;
```

Here are the results from the UNICODE function example:
UNICODEC Function

Converts characters in the current SAS session encoding to Unicode characters.

Category: Character

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax

\[ \text{STR} = \text{UNICODEC}((\text{instr}),(\text{Unicode type})) \]

Required Argument

\[ \text{str} \]

data string that has been converted to Unicode encoding.

Optional Arguments

\[ \text{instr} \]

input data string.

\[ \text{Unicode type} \]

Unicode character formats

- **ESC**  Unicode Escape (for example, \u0042) ESC is the default format.
- **NCR**  Numeric Character Representation (for example, &\#22823 or &\#177 ;)
- **PAREN**  Unicode Parenthesis Escape (for example, <u0061>)
- **UTF8**  UTF8 encoding.
- **UTF16**  UTF16 encoding with big endian. UCS2 is an alias.
- **UTF16B**  UTF16 encoding with big endian. UCS2B is an alias.
- **UTF16L**  UTF16 encoding with little endian. UCS2L is an alias.
UTF32  UTF32 encoding with big endian. UCS4 is an alias.
UTF32B UTF32 encoding with big endian. UCS4B is an alias.
UTF32L UTF32L encoding with big endian. UCS4L is an alias.

Details
This function reads characters that are in the current SAS session encoding and converts them to Unicode encoding.

Example
The following example demonstrates the functionality of the UNICODEC function:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>data <em>null</em>;</td>
<td>str1=414243202020</td>
</tr>
<tr>
<td>str1=unicodec(&quot;ABC&quot;, 'utf8');</td>
<td>str2=414243C3A920</td>
</tr>
<tr>
<td>put str1= $hex12.;</td>
<td>run;</td>
</tr>
<tr>
<td>str2=unicodec(&quot;ABCé&quot;, 'utf8');</td>
<td></td>
</tr>
<tr>
<td>put str2= $hex12.;</td>
<td></td>
</tr>
</tbody>
</table>

UNICODELEN Function
Specifies the length of the character unit for the Unicode data.

Category: Character

Restriction: This function is assigned an I18N Level 2 status and designed for use with SBCS, DBCS, and MBCS (UTF8). For more information, see Internationalization Compatibility on page 341.

Syntax
UNICODELEN()

Details
The UNICODELEN function specifies the length of the character unit for the UNICODE data.

Example
This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.
UNICODEWIDTH Function

Specifies the length of a display unit for the Unicode data.

Details
The UNICODEWIDTH function specifies the length of a display unit for the Unicode data. The display unit displays the width of a character when the character is displayed with fixed width font.

The characters in CJK Symbols, CJK Unified Ideographs, Full width Alphabets and Punctuation, Full width currency symbols, CJK Unified Ideograph Extension B-D and CJK Compatibility Ideographs Supplement have the value of a display unit 2. Other characters are display unit 1.

Example
This example uses the Japanese Shift_JIS session encoding, which is supported under the UNIX operating system.
len1=unicodewidth("abcœ"); len1=5
len2=unicodewidth("\u0041\u0042\u0043\u5927","esc"); len2=5
len3=unicodewidth("&\#22823; ","ncr"); len3=2
len4=unicodewidth("<u0061><u0062>","paren"); len4=2

- “UNICODELEN Function” on page 507

VARTRANSCODE Function

Returns the transcode attribute of a SAS data set variable.

Syntax

VARTRANSCODE(data-set-id, var-num)

Required Arguments

data-set-id
specifies the data set identifier that the OPEN function returns.

var-num
specifies the position of the variable in the SAS data set.

Tip  The VARNUM function returns this value.

Details

Transcoding is the process of converting data from one encoding to another. The VARTRANSCODE function returns 0 if the var-num variable does not transcode its value, or 1 if the var-num variable transcodes its value.

Example

The following example shows how to determine whether a character variable is transcoded:

```sas
data a;
    attrib x length=$3. transcode=no;
    attrib y length=$3. transcode=yes;
    x='abc';
    y='xyz';
run;

data _null_;  
    dsid=open('work.a','i');
    nobs=attrn(dsid,"nobs");
    nvars=attrn(dsid,"nvars");
    do i=1 to nobs;
        xrc=fetch(dsid,1);
        do j=1 to nvars;
            transcode = vartranscode(dsid,j);
            put transcode=;
        end;
    end;
run;
```

SAS writes the following output to the log:

```
transcode=0
transcode=1
```

- “VARNUM Function” in SAS Functions and CALL Routines: Reference
- “VTRANSCODE Function” on page 510
- “VTRANSCODEX Function” on page 512

VTRANSCODE Function

Returns a value that indicates whether transcoding is enabled for the specified character variable.

Categories: CAS Variable Information

Syntax

```
VTRANSCODE (var)
```
Required Argument

**var**

specifies a character variable that is expressed as a scalar or as an array reference.

**Restriction**

You cannot use an expression as an argument.

Details

The **VTRANSCODE** function returns 0 if transcoding is off, and 1 if transcoding is on.

By default, all character variables in the DATA step are transcoded. You can use the **TRANSCODE=** attribute of the **ATTRIB** statement to turn transcoding off.

Comparisons

- The **VTRANSCODE** function returns a value that indicates whether transcoding is enabled for the specified variable. The **VTRANSCODEX** function, however, evaluates the argument to determine the variable name. The function then returns the transcoding status (on or off) that is associated with that variable name.

- The **VTRANSCODE** function does not accept an expression as an argument. The **VTRANSCODEX** function accepts expressions, but the value of the specified expression cannot denote an array reference.

- Related functions return the value of other variable attributes, such as the variable name, type, format, and length. For a list of the variable attributes, see the "Variable Information" functions in **SAS Functions and CALL Routines: Reference**.

Example

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrib x transcode = yes;</td>
<td></td>
</tr>
<tr>
<td>attrib y transcode = no;</td>
<td></td>
</tr>
<tr>
<td>rcl = vtranscode(y);</td>
<td>rcl=0</td>
</tr>
<tr>
<td>put rcl=;</td>
<td></td>
</tr>
</tbody>
</table>

See Also

**Functions:**

- "**VTRANSCODEX** Function" on page 512

**Statements:**

- **ATTRIB** in
VTRANSCODEX Function

Returns a value that indicates whether transcoding is enabled for the specified argument.

Categories: CAS
Variable Information

Syntax

VTRANSCODEX (var)

Required Argument

var specifies any SAS character expression that evaluates to a character variable name.

Restriction The value of the specified expression cannot denote an array reference.

Details

The VTRANSCODEX function returns 0 if transcoding is off, and 1 if transcoding is on.

By default, all character variables in the DATA step are transcoded. You can use the TRANSCODE= attribute of the ATTRIB statement to turn transcoding off.

Comparisons

- The VTRANSCODE function returns a value that indicates whether transcoding is enabled for the specified variable. The VTRANSCODEX function, however, evaluates the argument to determine the variable name. The function then returns the transcoding status (on or off) that is associated with that variable name.

- The VTRANSCODE function does not accept an expression as an argument. The VTRANSCODEX function accepts expressions, but the value of the specified expression cannot denote an array reference.

- Related functions return the value of other variable attributes, such as the variable name, type, format, and length. For a list of the variable attributes, see the “Variable Information” functions in SAS Functions and CALL Routines: Reference.

Example

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>Statements</td>
<td>Result</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>--------</td>
</tr>
<tr>
<td>attrib x transcode = yes;</td>
<td>rcl=0</td>
</tr>
<tr>
<td>attrib y transcode = no;</td>
<td></td>
</tr>
<tr>
<td>rcl = vtranscodex('y');</td>
<td></td>
</tr>
<tr>
<td>put rcl=;</td>
<td></td>
</tr>
</tbody>
</table>

Informats by Category

Some informats run in SAS only, and some informats run in SAS and on the CAS engine. If CAS is specified for the informat category, then the informat runs in SAS and on the CAS server. If CAS is not specified for the informat category, then the informat runs in SAS only. For example, the NLDATE informat runs in SAS and on the CAS server, so CAS is specified as a category. The $UNCR informat runs on SAS only, so CAS is not specified as a category.

These categories for SAS informats support NLS:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIDI Text Handling</td>
<td>Instructs SAS to read bidirectional data values from data variables.</td>
</tr>
<tr>
<td>CAS</td>
<td>Instructs SAS that these informats run on the CAS server.</td>
</tr>
<tr>
<td>Character</td>
<td>Instructs SAS to read character data values into character variables.</td>
</tr>
</tbody>
</table>
### Category | Description
--- | ---
DBCS | Instructs SAS to manage various Asian languages.
Date and Time | Instructs SAS to read data values into variables that represent dates, times, and datetimes.
Hebrew Text Handling | Instructs SAS to read Hebrew data from data variables.
Numeric | Instructs SAS to read numeric data values into numeric variables.

The following table provides brief descriptions of the SAS informats. For more detailed descriptions, see the NLS entry for each informat.

<table>

$CPTDw. Informat

Reads a character string that is in Hebrew DOS (cp862) encoding, and then converts the character string to Windows (cp1255) encoding.

Category: Hebrew Text Handling
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$CPTDw.

Syntax Description

\( w \)

specifies the width of the input field.

Default: 200
Range: 1–32767

Comparisons

The $CPTDw. informat performs processing that is opposite of the $CPTWD\ w. informat.

Example

The following example uses the input value of 808182.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input('808182',$cptd6.);</td>
<td>ג'דע</td>
</tr>
<tr>
<td>put x;</td>
<td>ג'דע</td>
</tr>
</tbody>
</table>

See Also

Formats:
- "$CPTD\ bw. Format" on page 123
$CPTWDw. Informat

Reads a character string that is in Windows (cp1255) encoding, and then converts the character string to Hebrew DOS (cp862) encoding.

Category: Hebrew Text Handling

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$CPTWDw.

Syntax Description

w

specifies the width of the input field.

Default 200

Range 1–32767

Comparisons

The $CPTWDw. informat performs processing that is opposite of the $CPTDWw. informat.

Example

The following example uses the input value of קבר.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input ('קבר',$cptwd6.);</td>
<td>€brero</td>
</tr>
<tr>
<td>put x;</td>
<td></td>
</tr>
</tbody>
</table>

Formats:
EUROw.d Informat

Reads numeric values, removes embedded characters in European currency, and reverses the comma and decimal point.

Category: Numeric
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

**EUROw.d**

Syntax Description

**w**

specifies the width of the input field.

Default: 6
Range: 1–32

**d**

specifies the power of 10 by which to divide the value. If the data contains decimal points, the d value is ignored.

Default: 0
Range: 0–31

Details

The EUROw.d informat reads numeric values and removes embedded euro symbols (E), commas, blanks, percent signs, hyphens, and close parentheses from the input data. A decimal point is assumed to be a separator between the whole number and the decimal portion. The EUROw.d informat converts an open parenthesis at the beginning of a field to a minus sign.

Comparisons

- The EUROw.d informat is similar to the EUROXw.d informat, but EUROXw.d reverses the roles of the decimal point and the comma. This convention is common in European countries.
If no commas or periods appear in the input, then the EUROw.d and the EUROXw.d informats are interchangeable.

Example

The following table shows input values for currency in euros, the SAS statements that are applied, and the results.

```sas
data _null_;
  input x euro10.;
  put x=;
  datalines;
E1
E1.23
1.23
1,234.56
;
run;
SAS Log:
x=1
x=1.23
x=1.23
x=1234.56
```

<table>
<thead>
<tr>
<th>Values</th>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1</td>
<td>input x euro10.; put x;</td>
<td>1</td>
</tr>
<tr>
<td>E1.23</td>
<td>input x euro10.; put x;</td>
<td>1.23</td>
</tr>
<tr>
<td>1.23</td>
<td>input x euro10.; put x;</td>
<td>1.23</td>
</tr>
<tr>
<td>1,234.56</td>
<td>input x euro10.; put x;</td>
<td>1234.56</td>
</tr>
</tbody>
</table>

EUROXw.d Informat

Reads numeric values and removes embedded characters in European currency.

Category: Numeric

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

EUROXw.d

Syntax Description

w
specifies the width of the input field.

Default 6
Range 1–32

d
specifies the power of 10 by which to divide the value. If the data contains a comma, which represents a decimal point, the d value is ignored.

Default 0
Range 0–31

Details

The EUROXw.d informat reads numeric values and removes embedded euro symbols (E), periods, blanks, percent signs, hyphens, and close parentheses from the input data. A comma is assumed to be a separator between the whole number and the decimal portion. The EUROXw.d informat converts an open parenthesis at the beginning of a field to a minus sign.

Comparisons

- The EUROXw.d informat is similar to the EUROw.d informat, but EUROw.d reverses the roles of the comma and the decimal point. This convention is common in English-speaking countries.
- If no commas or periods appear in the input, the EUROXw.d and the EUROw.d informats are interchangeable.

Example

The following table shows input values for currency in euros, the SAS statements that are applied, and the results.

```sas
data _null_;
```

input x eurox10.;
put x=

datalines;
E1
E1.23
1.23
1,234.56
; run;
SAS Log:
7       input x eurox10.;
8       put x=
9       datalines;
x=1
x=123
x=123
x=1.23456

<table>
<thead>
<tr>
<th>Values</th>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1</td>
<td>input x eurox10.; put x;</td>
<td>1</td>
</tr>
<tr>

JNENGOw. Informat
Reads Japanese kanji date values in the form yyyymmdd.
Category: Date and Time
Syntax

JNENGO\(w\).

Syntax Description

\(w\)

specifies the width of the input field.

Default: 16

Range: 16–32

Details

The JNENGO\(w\). informat reads Japanese kanji values in the form \(yymmdd\). You can separate the year, month, and day values by blanks or special characters. The width of the input field should include space for blanks and special characters.

Note: SAS interprets a two-digit year as belonging to the 100-year span that is defined by the \texttt{YEARCUTOFF=} system option.

Example

The following example shows how to use the JNENGO informat to convert kanji values to SAS date values. The date values in the data lines are separated by special characters.

```sas
data null;
  input x jnengo.;
datalines;
明治1年4月6日
明治45年7月29日
大正1年7月30日
大正15年12月24日
昭和1年12月25日
昭和64年1月7日
平成1年1月8日
平成10年12月8日;
```

$KANJl. Informat

Removes shift code data from DBCS data.
Syntax

$KANJIw.

Syntax Description

w specifies the width of the input field.

Range
The minimum width for the informat is 2.

Restriction
The width must be an even number. If it is an odd number, it is truncated. The width must be equal to or greater than the length of the shift-code data.

Details

The $KANJI informat removes shift-code data from DBCS data. The $KANJI informat processes host-mainframe data. $KANJI can be used on other platforms. If you use the $KANJI informat on non-EBCDIC (non-modal encoding) hosts, the data does not change.

The data must start with SO and end with SI, unless single-byte blank data are returned. The input data length must be $2 + (SO/SI length) * 2$.

See Also

Formats:

- “$KANJIlw. Format” on page 144
- “$KANJIXw. Format” on page 145

Informat:

- “$KANJIXw. Informat” on page 540

$KANJIXw. Informat

Adds shift-code data to DBCS data.

Category: DBCS

Restriction: This informat is not supported in a DATA step that runs in CAS.
Syntax Description

\texttt{w}

specifies the width of the input field.

Range

The minimum width for the informat is \(2 + (\text{length of shift code used on the current DBCSTYPE= setting}) \times 2\).

Restriction

The width must be an even number. If it is an odd number, it is truncated. The width must be equal to or greater than the length of the shift-code data.

Details

The \$KANJIX informat adds shift-code data to DBCS data that does not have shift-code data. If the input data is blank, shift-code data is not added. The \$KANJIX informat processes host-mainframe data, but \$KANJIX can be used on other platforms. If you use the \$KANJIX informat on non-EBCDIC (non-modal encoding) hosts, the data does not change.

\$LOGVS\texttt{w}. Informat

Reads a character string that is in left-to-right logical order, and then converts the character string to visual order.

Category: BIDI Text Handling

Restriction: This informat is not supported in a DATA step that runs in CAS.
Comparisons
The $LOGVSw. informat performs processing that is opposite to the LOGVSRw. informat.

Example
The following example uses the Hebrew input value of "fly Flight."

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input ('ף ל א ט ל_flight',$logvs12.);</td>

<tr>
<td>\texttt{x=input ('יולקניז אל חNear',$logvsr12.;)}; \texttt{put x;}</td>
<td>computer חNear</td>
</tr>
</tbody>
</table>

See Also

Formats:
MINGUOw. Informat

Reads dates in Taiwanese format.

Category: Date and Time
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

MINGUOw.

Syntax Description

w
specifies the width of the input field.

**Default**: 6

**Range**: 6–10

Details

The general form of a Taiwanese date is yyyyymmdd:

- **yyyy** is an integer that represents the year.
- **mm** is an integer from 01 through 12 that represents the month.
- **dd** is an integer from 01 through 31 that represents the day of the month.

The Taiwanese calendar uses 1912 as the base year (01/01/01 is January 1, 1912). Dates before 1912 are not valid. Year values do not roll over after 100 years. Instead, they continue to increase.

You can separate the year, month, and day values with any delimiters, such as blanks, slashes, or hyphens, that are permitted by the YYMMDDw. informat. If delimiters are used, place them between all the values. If you omit delimiters, be sure to use a leading zero for days or months that have a value less than 10.

Example

The following examples use different dates for input values.
input date minguo10.;
put date date9.;
data _null_;
   input date minguo10.;
   put date date9.;
datalines;
49/01/01
891215
03-01-01
;
Values       Results
--++++-----++
49/01/01     01JAN1960
891215       15DEC2000
103-01-01    01JAN2014

Informat:
  ■ “YYMMDDw. Informat” in SAS Formats and Informats: Reference

NENGOw. Informat
Reads Japanese date values in the form eyymmdd.
Category:          Date and Time
Restriction:       This informat is not supported in a DATA step that runs in CAS.

Syntax
NENGOw.

Syntax Description

  w
  specifies the width of the input field.
  Default 10
Details

The general form of a Japanese date is \textit{eyymddd}:

- \textit{e} is the first letter of the name of the imperial era (Meiji, Taisho, Showa, Heisei, or Reiwa).

- \textit{yy} is an integer that represents the year.

- \textit{mm} is an integer from 01 through 12 that represents the month.

- \textit{dd} is an integer from 01 through 31 that represents the day of the month.

The \textit{e} value can be separated from the integers by a period. If you omit \textit{e}, SAS uses the current imperial era. You can separate the year, month, and day values by blanks or any nonnumeric character. However, if delimiters are used, place them between all the values. If you omit delimiters, be sure to use a leading zero for days or months that are values less than 10.

Example

The following example uses different input values.

```r
data _null_
  input x nengo.;
  put x= date9.;
datalines;
  h11108
  h.11108
  11/10/08
;run;
```

\textbf{NLDATExw. Informat}

Reads the date value in the specified locale, and then converts the date value to the local SAS date value.

Categories: CAS
Date and Time

Alias: NLDATEW

Syntax

NLDATEw.

Syntax Description

w

specifies the width of the input field.

Default 10

Range 10–200

Example

The following examples use the input February 24, 2003.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>15760</td>

- "NLDATEw. Format" on page 154
Syntax

**NLDATETW**\(w\).

Syntax Description

\(w\) specifies the width of the output field. If necessary, SAS abbreviates the date to fit the format width.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>16–200</td>
</tr>
</tbody>
</table>

Example

The following examples use the input February 24, 2014.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>---+----1----+</td>
<td></td>
</tr>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>19778</td>
</tr>
<tr>
<td>data;</td>
<td></td>
</tr>
<tr>
<td>dy='Monday, February 24, 2014';</td>
<td></td>
</tr>
<tr>
<td>y=input(dy,nldatetw200.);</td>
<td></td>
</tr>
<tr>
<td>put y=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
<tr>
<td>options locale=German_Germany;</td>
<td>19778</td>
</tr>
<tr>
<td>dy='Mo. 24.Februar 2014';</td>
<td></td>
</tr>
<tr>
<td>y=input(dy,nldatetw16.);</td>
<td></td>
</tr>
<tr>
<td>put y=;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**NLDATMw. Informat**

Reads the datetime value of the specified locale, and then converts the datetime value to the local SAS datetime value.

Categories:

- CAS
- Date and Time

Alias:

- NLDATMW, NLDATMAP
Syntax

NLDATMw.

Syntax Description

w

specifies the width of the input field.

Default 19

Range 19–200

Example

The following examples use the input value of February 24, 2003 12:39:43.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>1361709583</td>
</tr>
<tr>
<td>y=input('24.Feb03:12:39:43', nldatm.);</td>
<td></td>
</tr>
<tr>
<td>put y=;</td>
<td></td>
</tr>
<tr>
<td>options locale=German_Germany;</td>
<td>1330171200</td>
</tr>
<tr>
<td>y=input('24.Februar 2003 12.39 Uhr', nldatm.);</td>
<td></td>
</tr>
<tr>
<td>put y=;</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

NLMNLCNF\(w.d\)

Syntax Description

\(w\)

specifies the width of the output field.

Default: 12

Range: 8–32

\(d\)

specifies to divide the number by \(10^d\). If the data contains decimal points, the \(d\) value is ignored.

Default: 2

Range: 0–28

Example

In the following example, the LOCALE= system option is set to English_UnitedStates.

\(x=\text{input}('($12,345.67)'\,\text{nlmnlchf32.2});\)
\(y=\text{input}('($12,345.67)'\,\text{dollar32.2});\)

\textbf{NLMNLPLNw.d Informat}

Reads the monetary format of the local expression for Poland.

Categories:  
- CAS
- Numeric
Syntax

\textbf{NLMNLPLN} w.d

Syntax Description

\textbf{w}

specifies the width of the output field.

\textbf{Default} 12

\textbf{Range} 8–32

\textbf{d}

specifies to divide the number by \(10^d\). If the data contains decimal points, the \(d\) value is ignored.

\textbf{Default} 2

\textbf{Range} 0–28

Example

In the following example, the \texttt{LOCALE=} system option is set to \texttt{English\_UnitedStates}.

\begin{verbatim}
x=input('($12,345.67)',nlmnlpln32.2);
y=input('($12,345.67)',dollar32.2);
\end{verbatim}

<table>
<thead>
<tr>

NLMNYw.d Informat

Reads monetary data in the specified locale for the local expression, and then converts the data to a numeric value.

Categories:
-CAS
-Numeric

Syntax

NLMNYw.d

Syntax Description

w
  specifies the width of the input field.
  
  Default 9
  
  Range 1–32

d
  specifies whether to divide the number by $10^d$. If the data contains decimal separators, the d value is ignored.
  
  Default 0
  
  Range 0–31

Details

The NLMNYw.d informat reads monetary data in the specified locale for the local expression, and then converts the data to a numeric value. It removes any thousands separators, decimal separators, blanks, the currency symbol, and the close parenthesis from the input data.

Comparisons

The NLMNYw.d informat performs processing that is the opposite of the NLMNYIw.d informat.

The NLMNYw.d informat is similar to the DOLLARw.d informat except that the NLMNYw.d informat is locale-specific.

NLMNY returns an error message if you enclose numerical data with apostrophes. The apostrophes specify that the data is character. The following example produces an error message because the numerical value 1 is enclosed in apostrophes.

``` SAS
data;
  x=input('''1''',NLMNY32.);
  put x=;
run;
```
Example
The following examples use the input value of $12,345.67.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options LOCALE=English_UnitedStates;</td>
<td>-12345.67</td>
</tr>
<tr>
<td>x=input('($12,345.67)',nlmny32.2);</td>
<td>-12345.67</td>
</tr>
<tr>
<td>y=input('($12,345.67)',dollar32.2);</td>
<td></td>
</tr>
<tr>
<td>put x=;</td>
<td></td>
</tr>
<tr>
<td>put y=;</td>
<td></td>
</tr>
</tbody>
</table>

NLMNYl.w.d Informat

Reads monetary data in the specified locale for the international expression, and then converts the data to a numeric value.

Categories: CAS Numeric

Syntax

\texttt{NLMNYl.w.d}

Syntax Description

\textit{w}

specifies the width of the input field.

Default \hspace{1cm} 9

Range \hspace{1cm} 1–32

\textit{d}

specifies whether to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.
Details
The NLMNYIw.d informat reads monetary data in the specified locale for the international expression, and then converts the data to a numeric value. It removes any thousands separators, decimal separators, blanks, the currency symbol, and the close parenthesis from the input data.

Comparisons
The NLMNYIw.d informat performs processing that is the opposite of the NLMNYd informat.

Example
The following examples use the input value of 12,345.67.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options LOCALE=English_UnitedStates; x=input('USD12,345.67',nlmnyi32.2); y=input('$-12,345.67',dollar32.2); put x=; put y=;</td>
<td>-12345.67 -12345.67</td>
</tr>
</tbody>

**NLNUMw.d Informat**
Reads numeric data in the specified locale for local expressions, and then converts the data to a numeric value.

Categories: CAS
Syntax

\texttt{NLNUMw.d}

Syntax Description

\textit{w}

specifies the width of the input field.

Default 6

Range 1–32

\textit{d}

specifies whether to divide the number by 10\(^d\). If the data contains decimal separators, the \textit{d} value is ignored. If a decimal symbol is not found, the data is regarded as an integer.

Default 0

Range 0–31

Details

The \texttt{NLNUMw.d}) informat reads numeric data in the specified locale for local expressions, and then converts the data to a numeric value. It removes any thousands separators, decimal separators, blanks, the currency symbol, and the close parenthesis from the input data.

\texttt{NLNUM} returns an error message if you enclose numerical data with apostrophes. The apostrophes specify that the data is character. The following example produces an error message because the numeric value 1 is enclosed in apostrophes:

\begin{verbatim}
data;
x=\texttt{input("'1'",NLNUM32.);}
put x=;
run;
\end{verbatim}

Comparisons

The \texttt{NLNUMw.d} informat performs processing that is opposite to the \texttt{NLNUMIw.d} informat.

Example

The following example uses \(-1234356.78\) as the input value.

\begin{center}
\begin{tabular}{|l|l|}
\hline
\textbf{Statements} & \textbf{Results} \\
\hline
\end{tabular}
\end{center}

\texttt{----+----1----+}

\begin{verbatim}
\texttt{--------1----+}
\end{verbatim}
NLNUMIw.d Informat

Reads numeric data in the specified locale for international expressions, and then converts the data to a numeric value.

Syntax

NLNUMIw.d

Syntax Description

\( w \)

specifies the width of the input field.

Default 6

Range 1–32

\( d \)

specifies to divide the number by \(10^d\). If the data contains decimal separators, the \(d\) value is ignored.

Default 0

Range 0–31
Details

The NLNUMIw.d informat reads numeric data in the specified locale for international expressions, and then converts the data to a numeric value. It removes any thousands separators, decimal separators, blanks, the currency symbol, and the close parenthesis from the input data.

Comparisons

The NLNUMIw.d informat performs processing that is opposite of the NLNUMw.d informat.

Example

The following example uses –1,234,356.78 as the input value.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>-1234356.78</td>
</tr>
<tr>
<td>x=input('-1,234,356.78', nlnumi32.2);</td>
<td></td>
</tr>
<tr>
<td>put x=;</td>
<td></td>
</tr>

NLPCTw.d Informat

Reads percentage data in the specified locale for local expressions, and then converts the data to a numeric value.

Categories: CAS

Numeric

Syntax

NLPCTw.d
Syntax Description

w
specifies the width of the input field.
Default 6
Range 1–32

d
specifies whether to divide the number by $10^d$. If the data contains decimal separators, the $d$ value is ignored.
Default 0
Range 0–31

Details

The NLPCTw.d informat reads percentage data in the specified locale for local expressions, and then converts the data to a numeric value. It divides the value by 100 and removes any thousands separators, decimal separators, blanks, the percent sign, and the close parenthesis from the input data.

Comparisons

The NLPCTw.d informat performs processing that is opposite of the NLPCTIw.d informat. The NLPCTw.d informat is similar to the PERCENTw.d informat except that the NLPCTw.d informat is locale-specific.

NLPCT returns an error message if you enclose numerical data with apostrophes. The apostrophes specify that the data is character. The following example produces an error message because the numerical value 1 is enclosed in apostrophes.

data;
  x=input("'1'",NLPCT32.);
  put x=;
  run;

Example

The following example uses –12,345.67% as the input value.

<table>

NLSTRMON Informat

Reads the month name in the specified locale and converts it to a numeric value.

Categories:

- CAS
- Numeric

Syntax

NLSTRMON

Details

The NLSTRMON informat reads the name of the month in the specified locale and converts it to a numeric value. These examples use the English_United States locale:

- The first month (January) = 1
- The second month (February) = 2
- The third month (March) = 3
- The fourth month (April) = 4
- The fifth month (May) = 5
- The sixth month (June) = 6
- The seventh month (July) = 7
- The eight month (August) = 8
- The ninth month (September) = 9
- The 10th month (October) = 10
- The 11th month (November) = 11
- The 12th month (December) = 12

Example

This example uses the French_France (fr_fr) locale:

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>options locale = fr_fr;</td>
<td>x=1</td>
</tr>
<tr>
<td>data test;</td>
<td></td>

<tr>
<td>x = input(&quot;apr&quot;,nlstrmon.);</td>
<td></td>
</tr>
<tr>
<td>put x = ;</td>
<td></td>
</tr>
<tr>
<td>run;</td>
<td></td>
</tr>
</tbody>
</table>

**NLTIMAPw. Informat**

Reads the time value and uses a.m. and p.m. in the specified locale, and then converts the time value to the local SAS time value.

Categories: CAS
            Date and Time

**Syntax**

NLTIMAPw.
Syntax Description

\[ w \]

- specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4–200</td>
</tr>
</tbody>
</table>

Example

The following example uses 04:24:43 p.m. as the input value.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>---+----1----+</td>
<td></td>
</tr>
<tr>
<td>options locale=English_UnitedStates;</td>
<td>16:24:43</td>
</tr>
<tr>
<td>y=input('04:24:43 PM',nltimap11.);</td>
<td></td>
</tr>
<tr>
<td>put y time.;</td>
<td></td>
</tr>
<tr>
<td>options locale=German_Germany;</td>
<td>16:24:00</td>
</tr>
<tr>
<td>y=input('16.24 Uhr',nltimap11.);</td>

- "NLTIMEw. Format" on page 294

$REVERJw. Informat

Reads character data from right to left and preserves blanks.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$REVERJw.

Syntax Description

w

specifies the width of the input field.

Default 1 if w is not specified

Range 1–32767
Comparisons

The $REVERJw. informat is similar to the $REVERSw. informat except that $REVERSw. informat left aligns the result by removing all leading blanks.

Example

The following example uses ABCD as the input value.

```plaintext
input @1 name $reverj7.;
```

<table>
<thead>
<tr>
<th>Values</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>------</td>
</tr>
<tr>
<td>ABCD</td>
<td>###DCBA</td>
</tr>
<tr>
<td>ABCD</td>
<td>DCBA###</td>
</tr>
</tbody>
</table>

1 The character # represents a blank space.

See Also

Informat:

- “$REVERSw. Informat” on page 638

$REVERSw. Informat

Reads character data from right to left, and then left aligns the text.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

```plaintext
$REVERSw.
```

Syntax Description

- **w** specifies the width of the input field.

  Default: 1 if **w** is not specified

  Range: 1–32767
Comparisons

The $REVERSw. informat is similar to the $REVERJw. informat except that $REVERJw. informat preserves all leading and trailing blanks.

Example

The following example uses ABCD as the input value.

```sas
input @1 name $revers7.;
```

<table>
<thead>
<tr>
<th>Values</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABCD</td>
<td>DCBA###</td>
</tr>
<tr>
<td>ABCD</td>
<td>DCBA###</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

1 The # character represents a blank space.

**Informat:**

- "$REVERJw. Informat" on page 637

---

$UCS2Bw. Informat

Reads a character string that is encoded in big-endian, 16-bit, UCS2, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

**Category:** Character

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

**Syntax**

$UCS2Bw.

**Syntax Description**

`w`

specifies the width of the input field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2–32767
Comparisons

The $UCS2Bw. informat performs processing that is opposite of the $UCS2BEw. informat. If you are processing data within the same operating environment, then use the $UCS2Xw. informat. If you are processing data from different operating environments, then use the $UCS2Bw. and $UCS2Lw. informats.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input('5927'x,$ucs2b.); put x=$hex4.;</td>
<td>x=91e5</td>
</tr>
</tbody>
</table>

$UCS2BEw. Informat

Reads a character string that is in the encoding of the current SAS session and then converts the character string to big-endian, 16-bit, UCS2, Unicode encoding.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UCS2BEw.
**Syntax Description**

`w`

specifies the width of the input field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default: 8

Range: 1–32767

**Comparisons**

The `$UCS2BEw` informat performs processing that is opposite of the `$UCS2Bw` informat.

**Example**

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ucs2str=input ('اكتسو', $ucs2be2.);</code></td>
<td><code>ucs2str=2020</code></td>
</tr>
<tr>
<td><code>put ucs2str=$hex4.;</code></td>
<td></td>
</tr>
</tbody>
</table>

---

**$UCS2Lw. Informat**

Reads a character string that is encoded in little-endian, 16-bit, UCS2, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

**Category:** Character

**Restriction:** This informat is not supported in a DATA step that runs in CAS.
Syntax

$UCS2Lw.

Syntax Description

w

specifies the width of the input field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2–32767

Comparisons

The $UCS2Lw. informat performs processing that is opposite of the $UCS2LEw. informat. If you are processing data within the same operating environment, then use the $UCS2Xw.informat. If you are processing data from different operating environments, then use the $UCS2Bw. and $UCS2Lw. informats.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input('2759'x,$ucs2l.); put x=$hex4.;</td>
<td>x=91e5</td>
</tr>
</tbody>

$UCS2LEw. Informat

Reads a character string that is in the encoding of the current SAS session and then converts the character string to little-endian, 16-bit, UCS2, Unicode encoding.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UCS2LEw.

Syntax Description

w

specifies the width of the input field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2–32767

Comparisons

The $UCS2LEw. informat performs processing that is opposite of the $UCS2Lw. informat.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ucs2str=input ('$', $ucs2le2.); ucs2str=2759</td>
<td></td>
</tr>
<tr>
<td>put ucs2str=$hex4;</td>
<td></td>
</tr>
</tbody>
</table>

### $UCS2Xw. Informat

Reads a character string that is encoded in 16-bit, UCS2, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

**Category:** Character

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

#### Syntax

```
$UCS2Xw.
```

#### Syntax Description

**w**

specifies the width of the output field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

- **Default:** 8
- **Range:** 2–32767

#### Comparisons

The $UCS2Xw. informat performs processing that is the opposite of the $UCS2XEm. informat. If you are processing data within the same operating environment, then use the $UCS2Xw. informat. If you are processing data from different operating environments, then use the $UCS2Bw. and $UCS2Lw. informats.

#### Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment. This example uses little-endian formatting.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input('5927'x,$ucs2x.); x=91e5</td>
<td></td>
</tr>
<tr>
<td>put x=$hex4.;</td>
<td></td>
</tr>
</tbody>
</table>

#### See Also

Formats:
$UCS2XEw. Informat

Reads a character string that is in the encoding of the current SAS session and then converts the character string to 16-bit, UCS2, Unicode encoding.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UCS2XEw.

Syntax Description

w specifies the width of the input field. Specify enough width to accommodate the 16-bit size of the Unicode characters.

Default 8

Range 2-32767

Comparisons

The $UCS2XEw. informat performs processing that is opposite of the $UCS2Xw. informat.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----------</td>
<td>--------</td>
</tr>
</tbody>
</table>
$\text{UCS4Bw. Informat}$

Reads a character string that is encoded in big-endian, 32-bit, UCS4, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

**Category:** Character

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

**Syntax**

$\text{UCS4Bw}$.

**Syntax Description**

\[ \text{w} \]

specifies the width of the input field. Specify enough width to accommodate the 32-bit size of the Unicode characters.

**Default** 8

**Range** 4–32767

**Comparisons**

If you are processing data within the same operating environment, then use the $\text{UCS4Xw}$ informat. If you are processing data from different operating environments, then use the $\text{UCS4Bw}$ and $\text{UCS4Lw}$ informats.
Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ucs4str=input(' 大', $ucs4be8.); ucs4str=00000020000005927</td>
<td></td>
</tr>

$UCS4Lw. Informat

 Reads a character string that is encoded in little-endian, 32-bit, UCS4, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

Category: Character
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UCS4Lw.

Syntax Description

w specifies the width of the input field. Specify enough width to accommodate the 32-bit size of the Unicode characters.

<table>
<thead>
<tr>
<th>Default</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>4–32767</td>
</tr>
</tbody>
</table>

Comparisons

If you are processing data within the same operating environment, then use the $UCS4Xw. informat. If you are processing data from different operating environments, then use the $UCS4Bw. and $UCS4Lw. informats.
Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>z=put('.com',$UCS4L16.);</td>
<td>2E000000630000006F0000006D000000</td>

$UCS4Xw. Informat

Reads a character string that is encoded in 32-bit, UCS4, Unicode encoding, and then converts the character string to the encoding of the current SAS session.

Category: Character
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UCS4Xw.

Syntax Description

w

specifies the width of the input field. Specify enough width to accommodate the 32-bit size of the Unicode characters.

Default 8
Range 4–32767
Comparisons

The `$UCS4Xw.` informat performs processing that is the opposite of the `$UCS4XEw.` informat. Use the `$UCS4Xw.` informat when you are processing data within the same operating environment. Use the `$UCS4Bw.` and `$UCS4Lw.` informats when you are processing data from different operating environments.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment. This example uses little-endian formatting.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>ucs4=put('91e5'x,$ucs4x.); sjis=input(ucs4,$ucs4x.); put ucs4=$hex8. sjis=$hex8.; run;</td>

$UCS4XEw. Informat

Reads a character string that is in the encoding of the current SAS session, and then converts the character string to 32-bit, UCS4, Unicode encoding.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.
Syntax

$UCS4XEw.$

Syntax Description

w

specifies the width of the input field. Specify enough width to accommodate the 32-bit size of the Unicode characters.

Default 8

Range 4–32767

Comparisons

The $UCS4XEw. informat performs processing that is the opposite of the $UCS4Xw. informat.

Example

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>

$UESCw. Informat

Reads a character string that is encoded in UESC representation, and then converts the character string to the encoding of the current SAS session.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.
Syntax

$UESCw$

Syntax Description

$w$

specifies the width of the output field.

Default 8

Range 1–32767

Details

If the characters are not available on all operating environments (for example, 0–9, a–z, A–Z) they must be represented in UESC representation. The $UESCw$. informat can be nested.

Comparisons

The $UESCw$. informat performs processing that is the opposite of the $UESCEw$. informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
</table>
| x=input('¥u5927', $uesc10.); y=input('¥uu5927', $uesc10.); z=input('¥uuu5927', $uesc10.); put x; put y; put z; | ¥u5927
|                                                                           | ¥uu5927          |

- "$UESCEw. Format" on page 316

Informat:
$UESCEw. Informat

Reads a character string that is in the encoding of the current SAS session, and then converts the character string to UESC representation.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UESCEw.

Syntax Description

w specifies the width of the input field.

Default 8

Range 1–32767

Details

The $UESCEw. informat can be nested.

Comparisons

The $UESCEw. informat performs processing that is opposite of the $UESCw. informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>x=input('ête', $uesc10.); y=input('¥u5927', $uesc10.); z=input('¥uu5927', $uesc10.); put x y z;</td>
<td>¥u5927 ¥uu5927 ¥uuu5927</td>
</tr>
</tbody>
</table>
$UNCRw. Informat

Reads an NCR character string, and then converts the character string to the encoding of the current SAS session.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UNCRw.

Syntax Description

w

specifies the width of the input field.

Default 8

Range 1–32767

Details

The input string must contain only characters and NCR. Any national characters must be represented in NCR.

Comparisons

The $UNCRw. informat performs processing that is opposite of the $UNCREw. informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.
Statements | Result
---|---
x=input ('大', $uncr10.); | 大
y=input('abc', $uncr10.); | abc
put X;
put Y;

### $UNCREw. Informat

Reads a character string in the encoding of the current SAS session, and then converts the character string to NCR.

**Category:** Character  

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

**Syntax**

$UNCREw.

**Syntax Description**

**w**

specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>1–32767</td>
</tr>
</tbody>
</table>

**Details**

The output string converts to plain characters and NCR. Any national characters convert to NCR.
Comparisons

The `$UNCREw` informat performs processing that is the opposite of the `$UNCRw` informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>x=input ('abc', $uncre12.);</code></td>
<td><code>6#22823;abc</code></td>

$UPARENw. Informat

Reads a character string that is encoded in UPAREN representation, and then converts the character string to the encoding of the current SAS session.

**Category:** Character

**Restriction:** This informat is not supported in a DATA step that runs in CAS.

**Syntax**

$UPARENw.

**Syntax Description**

`w` specifies the width of the input field.

<table>
<thead>
<tr>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>1–32767</td>
</tr>
</tbody>
</table>
Details

If the SAS session encoding does not have a corresponding Unicode expression, the expression remains in encoding of the current SAS session.

Comparisons

The $UPARENw. informat performs processing that is opposite of the $UPARENEw. informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>v=input('&lt;u0061&gt;',$uparen10.);</td>

$UPARENEw. Informat

Reads a character string that is in the encoding of the current SAS session, and then converts the character string to UPAREN representation.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.
Syntax

$UPARENEw$

Syntax Description

w

specifies the width of the input field.

Default 8

Range 1–32767

Comparisons

The $UPARENEw$. informat performs processing that is opposite of the $UPARENw$. informat.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>v=input('a',$uparen10.);</td>
<td>&lt;u0061&gt;</td>
</tr>
<tr>
<td>w=input('b',$uparene10.);</td>
<td>&lt;u0062&gt;</td>
</tr>
<tr>
<td>x=input('c',$uparene10.);</td>
<td>&lt;u0063&gt;</td>

$UPAREN\!Pw$. Informat

Reads a character string that is encoded in UPAREN representation, and then converts the character string to the encoding of the current SAS session, with national characters that remain in the encoding of the UPAREN representation.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UPAREN\!Pw$

Syntax Description

\textit{w} specifies the width of the input field.

Default: 8

Range: 1–32767

Details

If the UPAREN expression contains a national character, whose value is greater than Unicode 0x00ff, the expression remains as a UPAREN expression.

Example

These examples use the Japanese Shift_JIS encoding, which is supported under the UNIX operating system.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>v=INPUT('u0061',UPAREN10.);</td>

<tr>
<td>PUT w;</td>
<td></td>
</tr>
<tr>
<td>PUT x;</td>
<td></td>
</tr>
<tr>
<td>PUT y;</td>
<td></td>
</tr>
<tr>
<td>PUT z;</td>
<td></td>
</tr>
</tbody>
</table>
$UTF8Xw. Informat

Reads a character string that is encoded in UTF-8, and then converts the character string to the encoding of the current SAS session.

Category: Character

Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

$UTF8Xw.

Syntax Description

w

specifies the width of the input field.

Default 8

Range 1–32767

Comparisons

This example uses the Japanese Shift_JIS encoding, which is supported under the UNIX operating environment.

<table>
<thead>
<tr>
<th>Statements</th>
<th>Result</th>

YENw.d Informat

Removes embedded yen signs, commas, and decimal points.

Category: Numeric
Restriction: This informat is not supported in a DATA step that runs in CAS.

Syntax

YENw.d

Syntax Description

\( w \)

specifies the width of the input field.

Default: 1
Range: 1–32

\( d \)

specifies the power of 10 by which to divide the value.

Requirement: \( d \) must be 0 or 2

Tip: If the \( d \) is 2, then YENw.d reads a decimal point and two decimal digits. If \( d \) is 0, YENw.d reads the value without a decimal part.

Details

The hexadecimal representation of the code for the yen sign character is 5B on EBCDIC systems and 5C on ASCII systems. The monetary character that these codes represent might be different in other countries.

Example

The following example uses yen as the input.

```plaintext
input value yen10.2;
```

</tr>
</tbody>
</table>
%KSUBSTR Macro Function
%QKSUBSTR Macro Function (p. 673)

Produce a substring of a character string.

%KUPCASE Macro Function
%QKUPCASE Macro Function (p. 675)

Convert values to uppercase.

---

Dictionary

%KCMPRES Macro Function

%QKCMPRES Macro Function

Compresses multiple blanks and removes leading and trailing blanks.

Category: DBCS
Type: NLS macro function

Syntax

%KCMPRES (text | text expression)  
%QKCMPRES (text | text expression)

Details

The %KCMPRES and %QKCMPRES macro functions compress multiple blanks and removes leading and trailing blanks. %KCMPRES returns an unquoted result, even if the argument is quoted. %QKCMPRES returns a quoted result.

%QKCMPRES produces a result with the following special characters and mnemonic operators masked, so the macro processor interprets them as text instead of as elements of the macro language:

& % ' " { | + - * / < > = ^ ~ ; , # blank AND OR NOT EQ NE LE LT GE GT IN
%KINDEX Macro Function

Returns the position of the first character of a string.

Category: DBCS
Type: NLS macro function

Syntax

%KINDEX (source, string)

Required Arguments

source
is a character string or text expression.

string
is a character string or text expression.

Details

The %KINDEX function searches source for the first occurrence of string and returns the position of its first character. If string is not found, the function returns 0.

Example: Locating a Character

The following statements find the first character V in a string:

%let a=a very long value;
%let b=%index(&a,v);
%put V appears at position &b..;

When these statements execute, the following line is written to the SAS log:

V appears at position 3.

%KLEFT Macro Function

%QKLEFT Macro Function

Left-aligns an argument by removing leading blanks.

Category: DBCS
Requirement: MAUTOSOURCE system option
Syntax

%KLEFT (text | text expression)
%QKLEFT (text | text expression)

Details

The %KLEFT and %QKLEFT macro functions left-align arguments by removing leading blanks. If the argument contains a special character or mnemonic operator, listed here, use QKLEFT.

%KLEFT returns an unquoted result, even if the argument is quoted. %QKLEFT produces a result with the following special characters and mnemonic operators masked so that the macro processor interprets them as text instead of as elements of the macro language:

& % ' " ( ) + - * / < > = ¬ ^ ~ ; , # blank
AND OR NOT EQ NE LE LT GE GT IN

%KLENGTH Macro Function

Returns the length of a string.

Category: DBCS
Type: NLS macro function

Syntax

%KLENGTH (character string | text expression)

Details

If the argument is a character string, %KLENGTH returns the length of the string. If the argument is a text expression, %KLENGTH returns the length of the resolved value. If the argument has a null value, %KLENGTH returns 0.

Example: Returning String Lengths

The following statements find the lengths of character strings and text expressions:

%let a=Happy;
%let b=Birthday;
%let c=René;
%put The length of &a is %klength(&a).;
%put The length of &b is %klength(&b).;
%put The length of &c is %klength(&c).;
%put The length of &a &b To &c is %klength(&a &b to &c).;

%put with LENGTH macro %length(&c);

When these statements execute, the following is written to the SAS log:

The length of Happy is 5.
The length of Birthday is 8.
The length of René is 4.
The length of Happy Birthday To René is 22.

with LENGTH macro 5

%KSCAN Macro Function

%QKSCAN Macro Function

Search for a word that is specified by its position in a string.
Category: DBCS
Type: NLS macro function

Syntax

%KSCAN (argument, n<,delimiters > )
%QKSCAN (argument, n<,delimiters > )

Required Arguments

argument
is a character string or a text expression. If argument contains a special character or mnemonic operator, listed here, use %QKSCAN.

n
is an integer or a text expression that yields an integer, which specifies the position of the word to return. If n is greater than the number of words in argument, the functions return a null string. If n is negative, %KSCAN examines the character string and selects the word that starts at the end of the string and searches backward.

delimiter
specifies a character variable that produces characters that you want %QKSCAN to use as word separators in the character expression.

Details

The %KSCAN and %QKSCAN functions search argument and return the nth word. A word is one or more characters separated by one or more delimiters.

%KSCAN does not mask special characters or mnemonic operators in its results, even when the argument was previously masked by a macro quoting function. %QKSCAN masks the following special characters and mnemonic operators in its results:

& % ' * ( ) + - * / < > = ^ ~ ; , # blank
AND OR NOT EQ NE LE LT GE GT IN
In the `%KSCAN` function, `word` refers to a substring that has all of the following characteristics:
- is bounded on the left by a delimiter or the beginning of the string
- is bounded on the right by a delimiter or the end of the string
- contains no delimiters

A word can have a length of zero if there are delimiters at the beginning or end of the string or if the string contains two or more consecutive delimiters.

If you use the `%KSCAN` function with only two arguments, then the default delimiters depend on whether your computer uses ASCII or EBCDIC characters:
- If your computer uses ASCII characters, then the default delimiters are as follows:
  
  blank ! $ % & ( ) * + , - . / ; < ^ | 

  In ASCII environments that do not contain the ^ character, the `%KSCAN` function uses the ~ character instead.
- If your computer uses EBCDIC characters, then the default delimiters are as follows:
  
  blank ! $ % & ( ) * + , - . / ; < ¬ | ¢ |

The `%KSCAN` function allows character arguments to be null. Null arguments are treated as character strings with a length of zero. Numeric arguments cannot be null.

Example: Comparing the Actions of `%KSCAN` and `%QKSCAN`

This example illustrates the actions of `%KSCAN` and `%QKSCAN`:

```plaintext
%macro a;
  aaaaaa
%mend a;

%macro b;
  bbbbbbb
%mend b;

%macro c;
  ccccccc
%mend c;

%let x=%nrstr(%a*%b*%c);
%put X: &x;
%put The third word in X, with KSCAN: %kscan(&x,3,*);
%put The third word in X, with QKSCAN: %qkscan(&x,3,*);
```

The `%PUT` statement writes these lines to the log:

X: %a*%b*%c
The third word in X, with KSCAN: ccccccc
The third word in X, with QKSCAN: %c
%KSUBSTR Macro Function

Produce a substring of a character string.

Category: DBCS
Type: NLS macro function

Syntax

%KSUBSTR (argument, position<, length> )
%QKSUBSTR (argument, position<, length> )

Required Arguments

argument
is a character string or a text expression. If argument contains a special character or mnemonic operator, listed here, use %QKSUBSTR.

position
is an integer or an expression (text, logical, or arithmetic) that yields an integer that specifies the position of the first character in the substring. If position is greater than the number of characters in the string, %KSUBSTR and %QKSUBSTR issue a warning message and return a null value.

Optional Argument

length
is an optional integer or an expression (text, logical, or arithmetic) that yields an integer that specifies the number of characters in the substring. If length is greater than the number of characters following position in argument, %KSUBSTR and %QKSUBSTR issue a warning message and return a substring containing the characters from position to the end of the string. By default, %KSUBSTR and %QKSUBSTR produce a string containing the characters from position to the end of the character string.

Details

The %KSUBSTR and %QKSUBSTR functions produce a substring of argument, which begins at position and continues for the number of characters in length.

%KSUBSTR does not mask special characters or mnemonic operators in its result. %QKSUBSTR masks the following special characters and mnemonic operators:

& % ' " ( ) + - * / < > = ^ ~ ; , # blank
AND OR NOT EQ NE LE LT GE GT IN
Examples:

Example 1: Limiting a Fileref to Eight Characters

The macro MAKEFREF uses %KSUBSTR to assign the first eight characters of a parameter as a fileref, in case a user assigns one that is longer:

```
%macro makefref(fileref,file);
  %if %klength(&fileref) gt 8 %then
    %let fileref = %ksubstr(&fileref,1,8);
  filename &fileref "&file";
%mend makefref;
%makefref(humanresource,/dept/humanresource/report96)
```

SAS reads the following statement:

FILENAME HUMANRES "/dept/humanresource/report96";

Example 2: Storing a Long Macro Variable Value in Segments

The macro SEPMSG separates the value of the macro variable MSG into 40-character units and stores each unit in a separate variable:

```
%macro sepmsg(msg);
  %let i=1;
  %let start=1;
  %if %length(&msg)>40 %then
    %do;
      %do %until(%klength(&&msg&i)<40);
        %let msg&i=%qksubstr(&msg,&start,40);
        %put Message &i is: &&msg&i;
        %let i=%eval(&i+1);
        %let start=%eval(&start+40);
      %end;
      %put Message &i is: &&msg&i;
    %end;
    %else %put No subdivision was needed.;
%mend sepmsg;
%sepmsg(%nrstr(A character operand was found in the %EVAL function or %IF condition where a numeric operand is required. A character operand was found in the %EVAL function or %IF condition where a numeric operand is required.));
```

When this program executes, these lines are written to the SAS log:

Message 1 is: A character operand was found in the %EV
Message 2 is: AL function or %IF condition where a nu
Message 3 is: meric operand is required. A character
Message 4 is: operand was found in the %EVAL function or %IF condition where a numeric operand is required.)));
Message 5 is: or %IF condition where a numeric operan
Message 6 is: d is required.

Example 3: Comparing the Actions of %KSUBSTR and %QKSUBSTR

%KSUBSTR produces a resolved result because it does not mask special characters and mnemonic operators in the C language before processing it:
%let a=one;
%let b=two;
%let c=%nrstr(&a &b);
%put C: &c;
%put With KSUBSTR: %ksubstr(&c,1,2);
%put With QKSUBSTR: %qKsubstr(&c,1,2);

When these statements execute, these lines are written to the SAS log:

C: &a &b
With KSUBSTR: one
With QKSUBSTR: &a

%KUPCASE Macro Function

%QKUPCASE Macro Function

Convert values to uppercase.

Category: DBCS
Type: NLS macro function

Syntax

%KUPCASE (character string | text expression)
%QKUPCASE (character string | text expression)

Details

The %KUPCASE and %QKUPCASE functions convert lowercase characters in the argument to uppercase. %KUPCASE does not mask special characters or mnemonic operators in its results.

If the argument contains a special character or mnemonic operator, listed here, use %QKUPCASE. %QKUPCASE masks the following special characters and mnemonic operators in its results:

& % ' " ( ) + - * / < > = ~ ^ ~ ; , # blank
AND OR NOT EQ NE LE LT GE GT IN

%KUPCASE and %QKUPCASE are useful in comparing values because the macro facility does not automatically convert lowercase characters to uppercase before comparing them.
Examples:

Example 1: Capitalizing a Value to Be Compared

In this example, the macro RUNREPT compares a value input for the macro variable MONTH to the string DEC. If the uppercase value of the response is DEC, then PROC FSVIEW runs on the data set REPORTS.ENDYEAR. Otherwise, PROC FSVIEW runs on the data set with the name of the month in the REPORTS data library.

```sas
%macro runrept(month);
  %if %kupcase(&month)=DEC %then
    %str(proc fsview data=reports.endyear; run;);
  %else %str(proc fsview data=reports.&month; run;);
%mend runrept;
```

You can invoke the macro in any of these ways to satisfy the %IF condition:

```sas
%runrept(DEC)
%runrept(Dec)
%runrept(dec)
```

Example 2: Comparing %KUPCASE and %QKUPCASE

These statements show the results produced by %KUPCASE and %QKUPCASE:

```sas
%let a=begin;
%let b=%nrstr(&a);
%put KUPCASE produces: %kupcase(&b);
%put QKUPCASE produces: %qkupcase(&b);
```

When these statements execute, the following is written to the SAS log:

```
KUPCASE produces: BEGIN
QKUPCASE produces: &A
```

%VALIDCHS Macro Function

Validates the character(s) encoding compatibility for data set variables.

**Restriction:** This macro should not be used when the encoding value equals DEFAULT.

**Syntax**

```sas
%VALIDCHS(dsnm=dataset_name, libnm=libref_name<ENCODING=encoding_name,><COMPATIBLE=encoding_name>)
```

**Required Arguments**

- `dsnm=dataset_name`  
  name of the data set to be verified.
- `libnm=libref_name`  
  name of the SAS library to be verified.
Optional Arguments

**ENCODING=encoding_name**
optional encoding name that the %VALIDCHS macro function uses to validate that the characters in the data set are valid for the specified encoding. If the ENCODING= option is not specified, the encoding of the data set is used.

**COMPATIBLE=encoding_name**
optional encoding that the %VALIDCHS macro function uses to verify the compatibility of the data in the data set with the specified encoding. It helps determine whether you can successfully transfer the data set between a server and a client where the encoding is different. Incompatible characters can cause data transfer issues.

Details

Basics

The %VALIDCHS macro function scans the data set and inspects the characters in the data set’s character variables to determine whether they are valid for the specified encoding. If an ENCODING= option is specified, the %VALIDCHS macro function validates based on the ENCODING= value. If the ENCODING= option is not specified, then %VALIDCHS uses the encoding of the data set. If the COMPATIBLE= option is specified, %VALIDCHS validates the contents of the character data in the encoding of the data set (or the encoding of the ENCODING= option). Then it verifies the compatibility based on the encoding that is specified by the COMPATIBLE= option. For example, a data set with a euc-cn encoding, Chinese characters, and COMPATIBLE=wlatin1 is specified. %VALIDCHS verifies that the characters are valid for the euc-cn encoding. Then %VALIDCHS verifies the compatibility of the characters to see whether they are supported by the wlatin1 encoding. If %VALIDCHS detects invalid character(s) in the data set, it displays a message and continues validation.

Automatic Macro Variable

_validchars_rc is an automatic macro variable that is generated by %VALIDCHS. It indicates the test status. Here is an example:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>No invalid characters are found but data will cause the truncation</td>
</tr>
<tr>
<td>1</td>
<td>No invalid characters are found</td>
</tr>
<tr>
<td>0</td>
<td>Invalid characters are found</td>
</tr>
<tr>
<td>-1</td>
<td>Invalid characters are found and also data will cause the truncation</td>
</tr>
<tr>
<td>-2</td>
<td>General error</td>
</tr>
</tbody>
</table>

Examples:

**Example 1: Simple Validation of the Character Data in the Data Set**

%VALIDCHS uses the encoding of the input data set.

```bash
%VALIDCHS(dsnm=sashelp.class);
%put &_validchars_rc;
```

The encoding of the data set is us-ascii. The %VALIDCHS macro function finds that all the character data is valid in us-ascii so that it returns following message in the log:
Example 2: Validate the Character Data in the Data Set in the Specified Encoding

%VALIDCHS uses the specified encoding to validate these characters:

%VALIDCHS(dsnm=sashelp.class, encoding=utf-8);
%put &_validchars_rc;

These messages are written to the SAS log:

Example 3: Validate the Character Data and Check the Compatibility

%VALIDCHS(dsnm=sashelp.class, encoding=euc-cn, compatible=wlatin1);
%put &_validchars_rc;

These messages are written to the SAS log:

Example 4: Validate the Character Data and Check the Compatibility

The following data set has the wlatin1 encoding and a national character:

data mydata;
   length ch $1.;
   ch = '€';
run;

%VALIDCHS(dsnm=mydata, encoding=wlatin1, compatible=utf-8);
%put &_validchars_rc;

These messages are written to the SAS log:
System Options for NLS

Chapter 16

Dictionary of System Options for NLS
Dictionary of System Options for NLS

System Option Entries by Category

The language control category of SAS system options are affected by NLS. The following table provides brief descriptions of the SAS system options. For more detailed descriptions, see the dictionary entry for each SAS system option:

<table>
<thead>
<tr>
<th>Category</th>
<th>Language Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment Control:</td>

<td>SORTSEQ= System Option: UNIX, Windows, and z/OS (p. 706)</td>
<td>Specifies a language-specific collating sequence for the SORT and SQL procedures to use in the current SAS session.</td>
</tr>
</tbody>
</table>

---

**Dictionary**

**BOMFILE System Option**

Specifies whether to write the byte-order mark (BOM) prefix on Unicode-encoded external files.

Valid in: configuration file, SAS invocation, OPTIONS statement, SAS System Options window

Category: Files: External Files

PROC OPTIONS GROUP= EXTFILES

**Syntax**

**BOMFILE | NOBOMFILE**

**Syntax Description**

**BOMFILE**

Specifies to write a byte-order mark (BOM) prefix when a Unicode-encoded file is written to an external file.
NOBOMFILE
Specifies not to write a BOM prefix when a Unicode-encoded file is written to an external file.

Details
The BOMFILE system option does not apply when a Unicode-encoded external file is read.
A BOM is a signature at the beginning of a Unicode data stream. The size of the BOM varies depending on the encoding.

DATESTYLE= System Option
Specifies the sequence of month, day, and year when ANYTDTDE, ANYTDTDM, or ANYDTTME informat data is ambiguous.

Valid in:
SAS 9.4: Configuration file, SAS invocation, OPTIONS statement, SAS System Options window, SASV9_OPTIONS environment variable (UNIX only), SAS Viya: Configuration file, SAS invocation, OPTIONS statement, SASV9_OPTIONS environment variable (Linux only)

Categories:
Environment Control: Language Control
Input Control: Data Processing

PROC OPTIONS GROUP=

Default:
The default value is determined by the value of the LOCALE= system option.

Note:
This option cannot be restricted by a site administrator. For more information, see “Restricted Options” in SAS System Options: Reference.

Syntax
DATESTYLE= MDY | YMD | DMY | LOCALE

Syntax Description
MDY
specifies that SAS set the order as month, day, year.

YMD
specifies that SAS set the order as year, month, day.

DMY
specifies that SAS set the order as day, month, year.

LOCALE
specifies that SAS set the order based on the value that corresponds to the LOCALE= system option value and is one of the following: MDY | YMD | DMY.
Details

System option DATESTYLE= identifies the order of month, day, and year. The default value is LOCALE. The default LOCALE system option value is English. Therefore, the default DATESTYLE order is MDY.

To get the default settings for each locale option value, see Locale Values on page 809.

DBCS System Option: UNIX, Windows, and z/OS

Recognizes double-byte character sets (DBCS).

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Default: NODBCS
UNIX specifics: Also valid in SASV9_OPTIONS environment variable

Syntax

-DBCS | -NODBCS (UNIX and Windows)
DBCS | NODBCS ( z/OS)

Required Arguments

DBCS
recognizes double-byte character sets (DBCS) for encoding values. DBCS encodings are used to support East Asian languages.

NODBCS
does not recognize a DBCS for encoding values. Instead, a single-byte character set (SBCS) is used for encoding values. A single byte is used to represent each character in the character set.
Details

The DBCS system option is used for supporting languages from East Asian countries such as Chinese, Japanese, Korean, and Taiwanese.

- “DBCSTYPE System Option: UNIX, Windows, and z/OS” on page 687

DBCSLANG System Option: UNIX, Windows, and z/OS

Specifies a double-byte character set (DBCS) language.

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Default: none
UNIX specifics: Also valid in SASV9_OPTIONS environment variable

Syntax

-DBCSLANG language (UNIX and Windows)

DBCSLANG = language ( z/OS)

Required Argument

language depends on the operating environment. The following table contains valid language values:

Table 16.1 Supported DBCS Languages According to Operating Environment

<table>
<thead>
<tr>
<th>Language</th>
<th>z/OS</th>
<th>UNIX</th>
<th>Windows</th>

1 For z/OS only, HANGUL is a valid alias for KOREAN and HANZI is a valid alias for CHINESE.

Details

The proper setting for the DBCSLANG system option depends on which setting is used for the DBCSTYPE system option. Some of the settings of DBCSTYPE support all of the DBCSLANG languages. Other settings of DBCSTYPE support only Japanese.

CHINESE specifies the language used in the People's Republic of China, which is known as simplified Chinese. TAIWANESE specifies the Chinese language used in Taiwan, which is known as traditional Chinese.

- “DBCSTYPE System Option: UNIX, Windows, and z/OS” on page 687

DBCSTYPE System Option: UNIX, Windows, and z/OS

Specifies the encoding method to use for a double-byte character set (DBCS).

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
z/OS specifics: IBM
UNIX specifics:
Depends on the specific machine
Also valid in SASV9_OPTIONS environment variable

Windows specifics:
PCMS

Syntax

-DBCSTYPE encoding-method (UNIX and Windows)

DBCSTYPE = encoding-method ( z/OS)

Required Argument

encoding-method
specifies the method that is used to encode a double-byte character set (DBCS).
Valid values for encoding-method depend on the standard that the computer hardware manufacturer applies to the operating environment.

Details

DBCS encoding methods vary according to the computer hardware manufacturer and the standards organization.

The DBCSLANG= system option specifies the language that the encoding method is applied to. You should specify DBCSTYPE= only if you also specify the DBCS and DBCSLANG= system options.

z/OS DBCSTYPE= supports the DBCSTYPE= value of IBM.

DFLANG= System Option: UNIX, Windows, and z/OS

Specifies the language for international date informats and formats.

Valid in: configuration file, SAS invocation, OPTIONS statement, SAS System Options window
Category: Environment Control: Language Control
PROC OPTIONS GROUP=
Default: English
Syntax

DFLANG='language', locale

Syntax Description

'language'

specifies the language that is used for international date informats and formats.

These languages are valid values for language:

- Afrikaans
- Catalan
- Croatian
- Czech
- Danish
- Dutch
- English
- Finnish
- French
- German
- Hungarian
- Italian
- Japanese
- Macedonian
- Norwegian
- Polish
- Portuguese
- Russian
- Slovenian
- Spanish
- Swedish
- Swiss_French
- Swiss_German

locale

the locale that is specified with the locale system option becomes the active locale.

Details

You can change the value of the DFLANG system option during a SAS session, but you can use only one language at a time. The values for language are not case-sensitive.
When you specify `DFLANG=locale`, the locale that is specified in the system option of the `LOCALE` statement becomes the active locale. The locale or language must be supported by the `DFLANG` system option.

In the following example, the international date informats and formats would be German. The posix name for the German locale is `de_DE`. The German locale is supported by the `DFLANG` system option.

```plaintext
option locale=de_DE; /* German locale */
option  DFLANG=locale;
```

In the following example, the international date informats and formats would be English. Maltese is not supported by `DFLANG`, so the default locale is English.

```plaintext
option locale=mt_MT; /* Maltese locale */
option  DFLANG=locale;
```

When you specify `DFLANG=locale`, the output of the date format is displayed in the locale that is specified with the `LOCALE` system option. To control the date format in the output, the `DFLANG` locale uses the value based on the `LOCALE` system option that has been set at start-up. If `DFLANG` is set to a valid language, then the date format in the output is English by default. In the following example, the locale is set to French:

```plaintext
Sas.exe –locale French
  Proc print data=sashelp.class ; run ;
```

```
mercredi 09 mars 2011 14 h 25
```

If you set `DFLANG=JAPANESE`, then `DFLANG` behaves the same way as `DFLANG=LOCALE`.

The value `JAPANESE` is supported to allow customers running the Japanese image to see the datetime stamp in the SAS Log and the Listing formatted for Japanese.

- If `DFLANG` is not set at start up, the option value is set by the `LOCALE` option.
- The default format of the datetime stamp of the SAS log is English. If `DFLANG` is set to `LOCALE` or `JAPANESE`, the datetime stamp in the SAS Log is formatted according to the current SAS `LOCALE`.
- The default format of the datetime stamp of the SAS listing is English. If `DFLANG` is set to `LOCALE` or `JAPANESE`, the datetime stamp in each page of the output sent to the SAS Listing or ODS destinations is formatted according to the SAS `LOCALE` that was in effect immediately after `DFLANG=LOCALE` is set.
- Changes to the `LOCALE` option do not impact how the datetime stamp is formatted unless the `DTRESET` option is enabled. Then the datetime stamp is formatted according to the current SAS `LOCALE`.

You can use the value `JAPANESE` to process the Japanese image to see the datetime stamp in the SAS log and the listing formatted for Japanese. The value `LOCALE` is also supported.

See Also

* **DTRESET System Option**
ENCODING System Option: UNIX, Windows, and z/OS

Specifies the default character-set encoding for the SAS session.

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
UNIX specifics: latin1
Windows specifics: wlatin1
z/OS specifics: OPEN_ED-1047

Syntax
-ENCODING= ASCIIANY | EBCDICANY | encoding-value (UNIX and Windows)
ENCODING= encoding-value (UNIX, Windows, and z/OS)

Required Arguments

ASCIIANY
Transcoding normally occurs when SAS detects that the session encoding and data set encoding are different. ASCIIANY enables you to create a data set that SAS will not transcode if the SAS session that accesses the data set has a session that encoding value of ASCII. If you transfer the data set to a machine that uses EBCDIC encoding, transcoding occurs.

Note: ANY is a synonym for binary. Because the data is binary, the actual encoding is irrelevant.

EBCDICANY
is valid only for z/OS. Transcoding normally occurs when SAS detects that the session encoding and the data set encoding are different. EBCDICANY enables you to create a data set that SAS does not transcode if the SAS session accessing the data set has a session encoding value of EBCDIC. If you transfer the data set to a machine that uses ASCII encoding, transcoding occurs.

encoding-value
For valid values for all operating environments, see Chapter 24, “Encoding Values for a SAS Session,” on page 839.

Details
A character-set encoding is a set of characters that have been mapped to numeric values called code points.

The encoding for a SAS session is determined by the values of the ENCODING=, LOCALE=, DBCSTYPE=, and DBCSLANG= system options as follows:
If the ENCODING option is not specified, the value of Encoding is determined by the value of LOCALE and the operating system where SAS is running. Also, if LOCALE is not set, the default LOCALE is en_US.

If both LOCALE= and ENCODING= are specified, the session encoding is the value that is specified by the ENCODING= option.

If LOCALE= is specified and ENCODING= is not specified, SAS infers the appropriate encoding value from the LOCALE= value.

If the DBCS option is set, the values for the DBCSLANG= and DBCSTYPE= system options determine the ENCODING= and LOCALE= values.

---

**FSDBTYPE System Option: UNIX**

Specifies a full-screen double-byte character set (DBCS) encoding method.

Valid in: configuration file, SAS invocation, SASV9_OPTIONS environment variable

Category: Environment Control: Language Control

PROC OPTIONS GROUP=

Default: DEFAULT

UNIX specifics: all

**Syntax**

-FSDBTYPE encoding-method

**Details**

The FSDBTYPE= system option specifies the encoding method that is appropriate for a full-screen DBCS enabling method. Full-screen DBCS encoding methods vary according to the computer hardware manufacturer and the standards organization.

### FSIMM System Option: UNIX

Specifies input method modules (IMMs) for full-screen double-byte character set (DBCS).

- **Valid in:** configuration file, SAS invocation, SASV9_OPTIONS environment variable
- **Category:** Environment Control: Language Control
- **PROC OPTIONS GROUP=** LANGUAGECONTROL
- **Default:** none
- **UNIX specifics:** all

#### Syntax

```
-FSIMM fsdevice_name=IMM-name1<, fsdevice_name=IMM-name2> ...
```
Details

You can specify the following values for `IMM-name`:

TTY | SASWUJT

provides an interface for `/dev/tty`. This IMM enables you to enter DBCS strings through a terminal emulator that has DBCS input capability.

PIPE | SASWUJP

provides a pipe interface. This interface forks the DBCS input server process. The default server name is `saswujms`, which uses the vendor-supplied MOTIF toolkit.

For example, to use the PIPE input method module for X11 drivers, you would specify this code:

```
-FSIMM X11=PIPE
```

Note: The server is specified by using the FSIMMOPT option.

See Also

Conceptual Information:
- Chapter 5, “Double-Byte Character Sets (DBCS),” on page 45

System Option:
- “FSIMMOPT System Option: UNIX” on page 695

FSIMMOPT System Option: UNIX

Specifies options for input method modules (IMMs) that are used with a full-screen double-byte character set (DBCS).

Valid in: configuration file, SAS invocation, SASV9_OPTIONS environment variable
Category: Environment Control: Language Control
PROC OPTIONS GROUP=
Default: none
UNIX specifics: all

Syntax

```
-FSIMMOPT fullscreen-IMM:IMM-option
```
Details

The FSIMMOPT system option specifies an option for each full-screen IMM (input method module). You can specify only one FSIMMOPT option for each IMM. If you specify multiple FSIMMOPT options for the same IMM, only the last specification is used.

For example, you can use the FSIMMOPT option to specify the name of the server, MOTIF, to be used for the PIPE IMM:

```
-fsimmopt PIPE:MOTIF
```

System Option:
- “FSIMM System Option: UNIX” on page 694

---

**LOCALE System Option**

Specifies a set of attributes in a SAS session that reflect the language, local conventions, and culture for a geographical region.

Valid in: configuration file, SAS invocation, OPTIONS statement, SAS System Options window

Category: Environment Control: Language Control

PROC OPTIONS GROUP=

Default: English_UnitedStates

UNIX specifics: Also valid in SASV9_OPTIONS environment variable

**Syntax**

- **-LOCALE locale-name** (UNIX and Windows)
- **LOCALE=locale-name** (UNIX, Windows, and z/OS)

Required Argument

`locale-name`

For a complete list of locale values (SAS names and POSIX names), see “LOCALE= Values for PAPERSIZE and DFLANG, Options” on page 809.
Details

The LOCALE= system option is used to specify the locale, which reflects the local conventions, language, and culture a geographical region.

If the value of the LOCALE= system option is not compatible with the value of the ENCODING= system option, the character-set encoding is determined by the value of the ENCODING= system option.

If the DBCS= system option is active, the values of the DBCSTYPE= and DBCSLANG= system options determine the locale and character-set encoding.

When you set a value for LOCALE=, the value of the following system options is modified unless explicit values have been specified:

ENCODING=
  The locale that you set has a common encoding value that is used most often in the operating environment where SAS runs. If the ENCODING= option is not set explicitly in a config file or on the command line, SAS uses the ENCODING that is default for the LOCALE and operating system. The LOCALE might be set explicitly or can default. When the ENCODING= system option is set, the TRANTAB= system option is also set.

DATESTYLE=
  When LOCALE= is set, the DATESTYLE= system option uses the value that corresponds to the chosen locale.

DFLANG=
  When LOCALE= is set, the DFLANG= system option is set to a value that corresponds to the chosen locale.

PAPERSIZE=
  When LOCALE= is set, the PAPERSIZE= system option is set to a value that corresponds to the chosen locale and the ODS printer is set to the preferred unit of measurement, inches or centimeters, for that locale.

CAUTION

Under the Windows operating systems only: The LOCALE= option can be used to specify PAPERSIZE= only if the UNIVERSALPRINT and UPRINTMENUSWITCH system options are also specified. For details, see the UNIVERSALPRINT system option in SAS System Options: Reference and the UPRINTMENUSWITCH system option in SAS Companion for Windows.

See Also

- “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689
- “PAPERSIZE= System Option” in SAS System Options: Reference
LOCALEDATA System Option: UNIX, Windows, and z/OS

Specifies the source database for the locale information.

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP=
Default: SASLOCALE

Syntax

LOCALEDATA=SASLOCALE | REGISTRY

Syntax Description

SASLOCALE
specifies the locale definition from an internal SAS database.

REGISTRY
specifies the locale definition from the SAS registry.

Details

The SASLOCALE value system option specifies an internal database as the source of the locale’s definition. This database does not allow customization.

The REGISTRY value specifies an external database where locale definitions are customized by using PROC LOCALEDATA.

LOGLANGCHG System Option

Specifies whether the language of the SAS log can be changed.

Valid in: configuration file, SAS invocation
PROC OPTIONS GROUP=
Default: NOLOGLANGCHG

Syntax

LOGLANGCHG | NOLOGLANGCHG
Syntax Description

**LOGLANGCHG**
specifies that the language of the SAS log messages can be changed after start-up.

**NOLOGLANGCHG**
specifies that the language of the SAS log message cannot be changed after start-up.

Details
The following conditions result in these actions:

<table>
<thead>
<tr>
<th>ODSLANGCHG</th>
<th>LOGLANGCHG</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>ON</td>
<td>Language for ODS output and the SAS log can be changed based on LSWLANG= option setting.</td>
</tr>
<tr>
<td>OFF</td>
<td>OFF</td>
<td>Language for ODS output and the SAS log cannot be changed.</td>
</tr>
<tr>
<td>OFF</td>
<td>ON</td>

</tr>
<tr>
<td>ON</td>
<td>OFF</td>
<td>Language for ODS output can be changed based on LSWLANG= option.</td>
</tr>
</tbody>
</table>

See Also
- “ODSLANGCHG System Option” on page 704
- “LSWLANG System Option” on page 701
- “LOGLANGENG System Option” on page 699

**LOGLANGENG System Option**
Specifies using the English language for SAS log message text when the LOCALE option is set after start-up.

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Syntax

**LOGLANGENG | NOLOGLANGENG**

Syntax Description

**LOGLANGENG**
SAS log messages are displayed in English using the LSW feature.

**NOLOGLANGENG**
The LSW feature is not used to enable English for SAS log messages.

Details

The LOGLANGENG option interacts with the LOGLANGCHG, ODSLANGCHG, and LSWLANG options.

- **LOGLANGENG** has the same functionality as LSWLANG=EN and NOLOGLANGCHG.
- **ODSLANGCHG** is valid with LOGLANGENG.
- **NOLOGLANGENG** has no impact on the SAS session.
- During start-up, the configuration file (\sasroot\nlsls) and the LOCALE option determine the language for SAS messages. After start-up, if the LOCALE option is set and the LOGLANGENG option is on, the language for the SAS log output is English.
- If LOGLANGENG is enabled at start-up and the value of LOCALE is changed during the session, the SAS log output remains in English.
- If LOGLANGCHG is on, the SAS log is controlled by the LSWLANG= option.
- If ODSLANGCHG is on, the ODS text is controlled by the LSWLANG= option.
- If LOGLANGENG is not enabled at start-up and LOCALE is changed during the session, the SAS log output is displayed in the language that was set at start-up, unless both LOGLANGCHG and LSWLANG= are specified and LSWLANG has a value other than LOCALE.

Example

This example is a French SAS session with LOGLANGENG set to ON.

If LOGLANGENG is set to ON, then LSWLANG=EN and LOGLANGCHG is ON automatically. The SAS session always uses English for the SAS log, but the language of the ODS output is determined by the current SAS configuration.

LSWLANG System Option

Specifies the language for the language switching feature when the LOGLANGCHG or ODSLANGCHG system option is set at SAS invocation.

Valid in: configuration file, SAS invocation
Category: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Default: LOCALE

Syntax

```
LSWLANG=LOCALE | language
```

Required Arguments

**LOCALE**
- specifying the LOCALE argument preserves the behavior prior to SAS 9.4, where the SAS message text matches the value of the LOCALE= option.

**language**
- Specifies the language for ODS and the SAS log output. The following values can be specified:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN</td>
<td>English</td>
</tr>
<tr>
<td>FR</td>
<td>French</td>

<td>Korean</td>
</tr>
<tr>
<td>PL</td>
<td>Polish</td>
</tr>
</tbody>
</table>
MAPEBCDIC2ASCII= System Option

Specifies a translation table that SAS uses to transcode from EBCDIC to ASCII and from ASCII to EBCDIC.

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Alias: MAPE2A
Interaction: The MAPEBCDIC2ASCII= system option specifies a translation table to use for the SAS session. The table specified with MAPEBCDIC2ASCII is used by components such as $EBCDIC and $ASCII formats.

Syntax

MAPEBCDIC2ASCII= TRANTAB catalog-entry

Required Argument

catalog-entry
specifies a SAS catalog TRANTAB entry that contains translation tables. If you specify entry-name.type, SAS first searches SASUSER.PROFILE, then SASHELP_LOCALE, and then SASHELP_HOST for the name specified.

Details

MAPEBCDIC2ASCII= supports the requirements of national languages.

CAUTION
Do not change a translation table unless you are familiar with its purpose. Translation tables are used internally by SAS to implement NLS. If you are unfamiliar with translation tables, do not change the specifications without proper technical advice.
NLDECSEPARATOR System Option

Specifies whether SAS produces locale sensitive numeric output for the decimal separator or continues to format numbers with US English preferences.

Valid in:
- configuration file
- SAS invocation
- OPTIONS statement
- SAS System Options window

PROC
OPTIONS
GROUP=

Alias: NLD
Default: NONLSDECSEPARATOR

Syntax

NLDECSEPARATOR | NONLDECSEPARATOR

Required Arguments

NLDECSEPARATOR
- Enables locale-sensitive numeric output for the decimal separator.

NONLDECSEPARATOR
- Disables locale-sensitive numeric output for the decimal separator.

Details

Use the BESTDOTX format with the NLDECSEPARATOR option to produce a numeric value with a dot as a decimal separator. If you do not use the BESTDOTX format, the result could contain a comma (1,2). SAS does not interpret this output as a numeric value. It would result in an error if the value is used in a later assignment statement.

Some SAS functions, such as CALL SYMPUT, convert numeric values to a character string using the BEST format by default. When NLDECSEPARATOR is enabled, the BEST format uses the separator character that matches the preferences for the current locale. If the locale uses a dot as a separator character, the resulting string can be used later in a SAS statement that evaluates the value as a number. However, if the separator character is a comma or other character, the result causes a syntax error if the SAS code attempts to use it as a number.

To avoid this type of error, use BESTDOTX to format the value before assigning it within the CALL SYMPUT statement. BESTDOTX always uses a dot as a decimal separator in the results that it produces. For example, in the SAS code here, BESTDOTX is used to format the value of the variable X before it is assigned to the macro variable &MACX. The value of &MACX can then be assigned to the SAS variable Y without causing a syntax error.

```sas
data a;
  x=1.2;
  CALL SYMPUT('macx', put(x, bestdotx.));
run;
```
data b;
  y=&macx
run;

See Also
“BESTDOTXw. Format” on page 120

ODSLANGCHG System Option
Determination whether the language of the text of the ODS output can be changed

Valid in: configuration file, SAS invocation
Category: Environment Control: Language Control
PROC OPTIONS GROUP= LANGUAGECONTROL
Default: ODSLANGCHG is set to off in all servers except for the UNICODE server
Tip: The language used for the language switching feature is controlled by LSWLANG= option. By default, LSWLANG is set to LOCALE, which specifies that the language of LSW is controlled by the language of LOCALE.

Syntax
ODSLANGCHG | NOODSLANGCHG

Syntax Description

ODSLANGCHG
  Specifies that the language of ODS output can change after start-up.

NOODSLANGCHG
  Specifies that the language of ODS output cannot change after start-up.

Details
The Language Switching feature (LSW) enables you to change the language of SAS messages and ODS templates after start-up. In order to use the LSW for ODS output, you must enable ODSLANGCHG.

During start-up, the configuration file determines the language for SAS messages and ODS templates. If the ODSLANGCHG option is set, the language of ODS output can change to reflect the LSWLANG= setting when the localizations are available.

You can enable ODSLANGCHG but not translate into the language of the locale. For example, if you enable ODSLANGCHG, then start a SAS session in French and set the locale to Greek, NLDATE is displayed in Greek. The output is displayed in French. The output is displayed in French because SAS does not translate into Greek.
Comparisons

If ODSLANGCHG is enabled and LSWLANG=LOCALE is set, the ODS PATH is updated based on the LOCALE setting to include the localized templates and corresponding localized messages are used to generate ODS output.

If ODSLANGCHG is not enabled at start-up, ODS output appears in the language that was specified in the configuration file.

Example

Example 1 is a French server with ODSLANGCHG not enabled (NOODSLANGCHG).

If a French-client application connects to the server, the output appears in French and dates, formatted by using the NL format, appear in French. If an English-client application connects to the French server, and the locale is changed to English on the server, then output messages appears in French, and dates formatted with NL formats appear in English.

Example 2 is a French server with ODSLANGCHG enabled (ODSLANGCHG) and LSWLANG=LOCALE.

If a French-client application connects to the server, the output appears in French and dates formatted by using the NL format, appear in French. If an English-client application connects to the French server, and the locale is changed to English on the server, then output messages appears in English, and dates formatted with NL format appears in English.

Example 3 is a French server with ODSLANGCHG enabled (ODSLANGCHG) and LSWLANG=English.

If a French-client application connects to the server, the output appears in English and dates formatted by using the NL format, appear in French. If an English-client application connects to the French server, and the locale is changed to English on the server, then output messages appear in English, and dates formatted with NL format appears in English.

RSASIOTRANSERROR System Option

Displays a transcoding error when invalid data is read from a remote application.

Valid in: configuration file, SAS invocation, OPTIONS statement, SAS System Options window

Category: Files: SAS Files

PROC OPTIONS GROUP=SASFILES

Default: RSASIOTRANSERROR
Syntax

**RSASIOTRANSERROR | NORSASIOTRANSERROR**

Syntax Description

**RSASIOTRANSERROR**
specifies to display a transcoding error when invalid values are read from a remote application.

**NORSASIOTRANSERROR**
specifies not to display a transcoding error when invalid values are read from a remote application.

Details

The RSASIOTRANSERROR system option enables remote users of SASIO, for example, SAS Enterprise Guide and SAS Enterprise Miner, to ignore invalid data values. An invalid data value typically causes a transcoding error when the data is read by a remote application.

---

**SORTSEQ= System Option: UNIX, Windows, and z/OS**

Specifies a language-specific collating sequence for the SORT and SQL procedures to use in the current SAS session.

**Valid in:** configuration file, SAS invocation, OPTIONS statement, SAS System Options window

**Category:** Sort: Procedure Options

`PROC OPTIONS GROUP=`

Syntax

**SORTSEQ=** `<sort-table>` | `<LINGUISTIC>`

Syntax Description

**sort-table**
specifies a translation table that you created with PROC TRANTAB.

**LINGUISTIC**
Sorts characters according to the rules of a specified language. The rules and default collating sequence are based on the language specified in the current locale setting. The implementation is provided by the International Components for Unicode (ICU) library. Refer to "Linguistic Sorting of Data Sets and ICU" in *Base SAS Procedures Guide* for more information.
Example

This example demonstrates the functionality of the SORTSEQ= option with PROC SORT and PROC SQL:

```
options sortseq=linguistic;
proc sort data=sashelp.class out=foo1;
by name;
run;
proc sql;
create table foo2 as select * from sashelp.class order by name;
quit;
run;
```

SAS provides ICU collation when the linguistic option (`SORTSEQ=LINGUISTIC`) is specified in the Base SAS procedure, PROC SORT. Linguistic collation can also be specified using the SORTSEQ= option in the SQL procedure and by specifying system option `SORTSEQ=LINGUISTIC`.

---

Note: Only PROC SORT and PROC SQL are affected when the `SORTSEQ=LINGUISTIC` system option is specified.

---

When the linguistic option is specified, SAS relies on the ICU libraries as the reference implementation of the Unicode Collation Algorithm (UCA) and as a de facto standard. For more information about the UCA algorithm or the ICU library implementation, see Download the ICU 4.8 Release and CLDR 2.0 Release Note.

In SAS Viya, the ICU library version incorporated by SAS and used by PROC SORT is ICU 56. This ICU version uses locale data from version 28 of the Unicode Common Locale Data Repository (CLDR). For in-depth information, see Download ICU 56 and CLDR 28 Release Note.

---

TIMEZONE= System Option

Specifies the user local time zone.

<table>
<thead>
<tr>
<th>Valid in:</th>
<th>SAS 9.4: Configuration file, SAS invocation, OPTIONS statement, SAS System Options window, SASV9_OPTIONS environment variable (UNIX only), SAS Viya: Configuration file, SAS invocation, OPTIONS statement, SASV9_OPTIONS environment variable (Linux only)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category:</td>
<td>Environment Control: Language Control</td>
</tr>
<tr>
<td>PROC OPTIONS GROUP=</td>
<td>LANGUAGECONTROL</td>
</tr>
<tr>
<td>Alias:</td>
<td>TZ=, except in the restricted options configuration file where TIMEZONE= must be used</td>
</tr>
</tbody>
</table>
Note: This option can be restricted by a site administrator. For more information, see “Restricted Options” in SAS System Options: Reference.

Syntax

TIMEZONE=’time-zone-name’ | ’time-zone-ID’

Syntax Description

time-zone-name
specifies a three- or four-character time zone name. For example, EST is a time zone name for Eastern Time.

Default BLANK, indicating that the SAS server time zone and the client time zone are the same

See For a list of time zone names, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

<-> specifies the time offset from Greenwich, England in the form <->hh:mm:ss>: 

- specifies the time zone offset west of Greenwich, England. Time zone offsets east of Greenwich do not require signed notation.

hh specifies an hour by using one or two digits. If you specify an offset, the hour is required.

mm specifies minutes by using one or two digits. Minutes are optional.

ss specifies seconds by using one or two digits. Seconds are optional.

time-zone-ID
specifies a region/area value that is defined by SAS. When you specify a time zone ID, the time zone that SAS uses is determined by time zone name and daylight saving time rules.

Note Time zone IDs are compatible with Java time zone names.

See For a list of time zone IDs, see Appendix 3, “Time Zone IDs and Time Zone Names,” on page 951.

Details

You set the TIMEZONE= option to a time zone ID or a time zone name in order for SAS to use a particular time zone. The time zone setting affects the following SAS components:

- times that are recorded by events and logs
- time of data set creation or modification
- DATE( ) function
- DATETIME( ) function
- TIME( ) function
- TODAY( ) function
time zone functions TZONEOFF( ), TZONEID( ), TZONENAME( ), TZONES2U( ), and TZONEU2S( ),

- time zone formats B8601DXw., E8601DXw., B8601LXw., E8601LXw., B8601TXw., E8601TXw., NLDATMZw., NLDATMTZw., and NLDATMWZw.

You set a time zone by specifying a time zone ID or a time zone name. A time zone ID is a region and an area separated by a forward slash (/). For example, America/New_York and Asia/Osaka are time zone IDs.

A time zone name is a three- or four-character name for a time zone. For example, EST is Eastern Time and JST is Japan Time. SAS determines the time by using time zone rules, including daylight saving time rules, before using a time value.

Some time zones names are valid for different locales. For example, CST is Central Standard Time, Cuba Daylight Time, and China Standard Time. SAS uses the value of the LOCALE= system option to determine the region and area to use. If TIMEZONE="CST" and LOCALE="zh_CN", SAS uses the Asia/Beijing time zone. If the time zone name does not exist for the locale, SAS searches all time zones and sets the time zone to the first match that it finds.

When this option is restricted and the value of TIMEZONE= is the default value of BLANK, time zone behavior does not use time zone information.

See Also
“Specifying Time Zones in SAS” on page 51

TRANTAB= System Option

Specifies the translation tables that are used by various parts of SAS.

Valid in: configuration file, SAS invocation, OPTIONS statement, SAS System Options window

Category: Environment Control: Language Control

PROC OPTIONS GROUP=

Defaults: SAS 9.4: The shipped default is (lat1wlt1,wlt1lat1,lat1_ucs,lat1_lcs,lat1_ccl,,)
SAS Viya: The shipped default is (lat1wlt1,wlt1lat1,lat1_ucs,lat1_lcs,lat1_ccl,,)

Interaction: The TRANTAB= system option specifies a translation table to use for the SAS session, including file transfers. The TRANTAB statement specifies a customized translation table (for example, to map an EBCDIC character to an ASCII character) to apply to the character set in the SAS file that is being exported or transferred.

Syntax

TRANTAB=(catalog-entries)

Syntax Description

- catalog-entries specifies SAS catalog entries that contain translation tables. If you specify entry-name.type, SAS searches SASUSER.PROFILE first and then SASUSER.HOST.
Details

TRANTAB= was introduced in SAS 6 to support the requirements of national languages. SAS 8.2 introduced the LOCALE= system option as an improvement on the features of TRANTAB=. In SAS 9, translations tables are set by the LOCALE= system option. They are used for transcoding external files. For SAS files, there is a direct transcoding between the session encodings.

SAS 9.2 supports the TRANTAB procedure for backward compatibility. However, using the LOCALE= system option is preferred in later SAS releases.

You can list the translation tables with PROC OPTIONS. The following example is on the z/OS environment with a LOCALE option set to en_US.

```plaintext
TRANTAB=(eol1wlt1,wlt1eol1,elat_ucs,elat_lcs,elat_ccl,,elat_scc)
```

Translation tables are specified in a list that is enclosed in parentheses and has ten positions. The position in which a table appears in the list determines the type of translation table that is specified. Individual entries in the list are separated by commas. See the list of positions and types that follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Type of Translation Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st</td>
<td>local-to-transport-format</td>
</tr>
<tr>
<td>2nd</td>
<td>transport-to-local-format</td>
</tr>
<tr>
<td>3rd</td>
<td>lowercase-to-uppercase</td>
</tr>
<tr>
<td>4th</td>
<td>uppercase-to-lowercase</td>

</tr>
<tr>
<td>8th</td>
<td>scanner character classification</td>
</tr>
<tr>
<td>9th</td>
<td>not used</td>
</tr>
<tr>
<td>10th</td>
<td>DBCS user table</td>
</tr>
</tbody>
</table>

**CAUTION**

_Do not change a translation table unless you are familiar with its purpose._

Translation tables are used internally by the SAS supervisor to implement NLS. If you are unfamiliar with the purpose of translation tables, do not change the specifications without proper technical advice.

To change one table, specify null entries for the other tables. For example, to change the lowercase-to-uppercase table, which is third in the list, specify uppercase as follows:
options trantab = ( , new-uppercase-table);

The other tables remain unchanged. The output from the OPTIONS procedure reflects the last specification for the TRANTAB= option and not the composite specification. Here is an example:

options trantab = ( , , new-uppercase-table);
options trantab = ( , , new-lowercase-table);

PROC OPTIONS shows that the value for TRANTAB= is ( , , new-lowercase-table), but both the new-uppercase and new-lowercase tables are in effect.

See Also

Chapter 20, “TRANTAB Procedure,” on page 781

VALIDMEMNAME= System Option

Specifies the rules for naming SAS data sets, SAS data views, and item stores.

Valid in: SAS 9.4: Configuration file, SAS invocation, OPTIONS statement, SAS System Options window, SASV9_OPTIONS environment variable (UNIX only), SAS Viya: Configuration file, SAS invocation, OPTIONS statement, SASV9_OPTIONS environment variable (Linux only)

Category: Files: SAS Files

PROC OPTIONS GROUP=SASFILES

Default: The shipped default is COMPATIBLE.

Applies to: Base SAS engine and SPD Engine

Restrictions: The VALIDMEMNAME= option is not supported by the tape engines V9TAPE, V8TAPE, V7TAPE, and V6TAPE.

Regardless of the value of VALIDMEMNAME, a member name cannot end in the special character # followed by three digits. This is because it would conflict with the naming conventions for generation data sets. Using such a member name results in an error.

Note: This option can be restricted by a site administrator. For more information, see “Restricted Options” in SAS System Options: Reference.

Syntax

VALIDMEMNAME=COMPATIBLE | EXTEND

Syntax Description

COMPATIBLE

specifies that a SAS data set name, a SAS data view name, or an item store name must follow these rules:

- The length of the names can be up to 32 characters.
- Names must begin with a letter of the Latin alphabet (A–Z, a–z) or an underscore. Subsequent characters can be letters of the Latin alphabet, numerals, or underscores.

- Names cannot contain blanks or special characters except for the underscore.

- Names can contain mixed-case letters. SAS internally converts the member name to uppercase. Therefore, you cannot use the same member name with a different combination of uppercase and lowercase letters to represent different variables. For example, customer, Customer, and CUSTOMER all represent the same member name. How the name is saved on disk is determined by the operating environment.

**Alias** COMPAT

**EXTEND**

specifies that a SAS data set name, a SAS data view name, or an item store name must follow these rules:

- Names can include national characters.

- The name can include special characters, except for the / \ * ? " < > : - characters.

  **Note:** The SPD Engine does not allow '.' (the period) anywhere in the member name.

- The name must contain at least one character (letters, numbers, valid special characters, and national characters).

- The length of the name can be up to 32 bytes.

- Null bytes are not allowed.

- Names cannot begin with a blank or a '.' (the period).

  **Note:** The SPD Engine does not allow '$' as the first character of the member name.

- Leading and trailing blanks are deleted when the member is created.

- Names can contain mixed-case letters. SAS internally converts the member name to uppercase. Therefore, you cannot use the same member name with a different combination of uppercase and lowercase letters to represent different variables. For example, customer, Customer, and CUSTOMER all represent the same member name. How the name appears is determined by the operating environment.

**Requirement**

When VALIDMEMNAME=EXTEND, SAS data set names, SAS data view names, and item store names must be written as a SAS name literal if the name includes blank spaces, special characters, or national characters. If you use either the percent sign (%) or the ampersand (&), then you must use single quotation marks in the name literal in order to avoid interaction with the SAS Macro Facility. For more information, see “SAS Name Literals” in SAS Language Reference: Concepts.
For Windows and UNIX operating environments, all Base SAS windows support the extended rules when `VALIDMEMNAME=EXTEND` is set.

For Windows and UNIX operating environments, when you reference a SAS file directly by its physical name, the final embedded period is an extension delimiter. If a physical file reference includes a SAS member name that contains a period, you must add the file extension. For example, if you reference the data set name `my.member` as a physical file, you would add the file extension `sas7bdat` to the reference, as shown in this SET statement: `set './saslib/my.member.sas7bdat'.`

The windowing environment for Base SAS supports the extended rules in the Editor, Log, and Output windows when `VALIDMEMNAME=EXTEND` is set. Other SAS windows, such as the `VIEWTABLE` window, do not support the extended rules.

When you reference a SAS file directly by its physical name, the final embedded period is considered to be an extension delimiter only if what follows the period is a valid SAS extension. Otherwise, the period is considered to be part of the member name. For example, in the name `my.member`, member is considered part of the member name and not a file extension. In the name `my.member.sas7bdat`, the member name is `my.member` and the file extension is `sas7bdat`.

The name is displayed in uppercase letters.

"How Many Characters Can I Use When I Measure SAS Name Lengths in Bytes?" in SAS Language Reference: Concepts

Examples

```
data "August Purchases"
;
```

```
data 'Años de empleo'
;
```

CAUTION

Throughout SAS, using the name literal syntax with SAS member names that exceed the 32-byte limit or that have excessive embedded quotation marks might cause unexpected results. The intent of the `VALIDMEMNAME=EXTEND` system option is to enable compatibility with other DBMS member naming conventions, such as allowing embedded blanks and national characters.

Details

When `VALIDMEMNAME= EXTEND`, valid characters that are allowed in a SAS data set name, SAS data view name, and an item store name are extended to these characters:

- international characters
- characters supported by third-party databases
- characters that are commonly used in a filename

Only the DATA, VIEW, and ITEMSTOR SAS member types support the extension of characters. The other member types, such as CATALOG and PROGRAM, do not.
support the extended characters. INDEX and AUDIT types that exist only with the associated DATA member support extended characters.

- “Rules for Words and Names in the SAS Language” in SAS Language Reference: Concepts

System Options:

- “VALIDVARNAME= System Option” on page 714

---

### VALIDVARNAME= System Option

Specifies the rules for valid SAS variable names that can be created and processed during a SAS session.

**Valid in:**
- SAS 9.4: Configuration file, SAS invocation, OPTIONS statement, SAS System Options window, SASV9_OPTIONS environment variable (UNIX only), SAS Viya: Configuration file, SAS invocation, OPTIONS statement, SASV9_OPTIONS environment variable (Linux only)

**Category:** Files: SAS Files

PROC OPTIONS GROUP=SASFILES

**Defaults:**
- The SAS shipped default is V7.
- The SAS Viya shipped default is ANY.

**Interaction:**
- SAS Studio sets VALIDVARNAME= to the Preferences setting before each code submission. For more information, see “System Options in SAS Studio” in SAS System Options: Reference.

**Note:**
- This option can be restricted by a site administrator. For more information, see “Restricted Options” in SAS System Options: Reference.

---

**Syntax**

```
VALIDVARNAME=V7 | UPCASE | ANY
```

**Syntax Description**

**V7**
- specifies that variable names must follow these rules:
  - The name can be up to 32 characters.
  - The first character must begin with a letter of the Latin alphabet (A - Z, a - z) or the underscore. Subsequent characters can be letters of the Latin alphabet, numerals, or underscores.
  - Trailing blanks are ignored. The variable name alignment is left-justified.
  - A variable name cannot contain blanks or special characters except for the underscore.
A variable name can contain mixed-case letters. SAS stores and writes the variable name in the same case that is used in the first reference to the variable. However, when SAS processes a variable name, SAS internally converts it to uppercase. Therefore, you cannot use the same variable name with a different combination of uppercase and lowercase letters to represent different variables. For example, `cat`, `Cat`, and `CAT` all represent the same variable.

Do not assign variables the names of special SAS automatic variables (such as `_N_` and `_ERROR_`) or variable list names (such as `_NUMERIC_`, `_CHARACTER_`, and `_ALL_`) to variables.

**Examples**

```sas
season='summer';
percent_of_profit=percent;
```

**UPCASE**

specifies that the variable name follows the same rules as V7, except that the variable name is uppercase, as in earlier versions of SAS.

**ANY**

specifies that SAS variable names must follow these rules:

- The name can begin with or contain any characters, including blanks, national characters, special characters, and multi-byte characters.
- The name can be up to 32 bytes in length.
- The name cannot contain any null bytes.
- Leading blanks are preserved, but trailing blanks are ignored.
- The name must contain at least one character. A name with all blanks is not permitted.
- The name can contain mixed-case letters. SAS stores and writes the variable name in the same case that is used in the first reference to the variable. However, when SAS processes a variable name, SAS internally converts it to uppercase. Therefore, you cannot use the same variable name with a different combination of uppercase and lowercase letters to represent different variables. For example, `cat`, `Cat`, and `CAT` all represent the same variable.

**Requirement**

If you use any characters other than the ones that are valid when the `VALIDVARNAME` system option is set to V7 (letters of the Latin alphabet, numerals, or underscores), then you must express the variable name as a name literal and you must set `VALIDVARNAME=ANY`. If the name includes either the percent sign (%) or the ampersand (&), then you must use single quotation marks in the name literal in order to avoid interaction with the SAS Macro Facility. See “SAS Name Literals” in SAS Language Reference: Concepts and “Avoiding Errors When Using Name Literals” in SAS Language Reference: Concepts.

**See**

**Examples**

```sas
'\% of profit'n=percent;
'items@warehouse'n=itemnum;
```
Throughout SAS, using the name literal syntax with SAS variable names that exceed the 32-byte limit or have excessive embedded quotation marks might cause unexpected results. The intent of the VALIDVARNAME=ANY system option is to enable compatibility with other DBMS variable (column) naming conventions, such as allowing embedded blanks and national characters.

## Dictionary

### CHARSET= Statement

Specifies the character set to be generated in the META declaration for the output.

<table>
<thead>
<tr>
<th>Valid in:</th>
<th>LIBNAME statement for the ODS MARKUP and ODS HTML statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category:</td>
<td>ODS: Third-Party Formatted</td>
</tr>
</tbody>
</table>

**Syntax**

```plaintext
CHARSET=character-set;
```
Required Argument

**character-set**

Specifies the character set to use in the META tag for HTML output.

An example of an encoding is UTF-8. Official character sets for use on the internet are registered by IANA (Internet Assigned Numbers Authority). IANA is the central registry for various internet protocol parameters, such as port, protocol and enterprise numbers, and options, codes and types. For a complete list of character-set values, see [www.unicode.org/reports/tr22/index.html](http://www.unicode.org/reports/tr22/index.html) and [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets).

A *character set* is like an *encoding-value* in this context. However, *character set* is the term that is used to identify an encoding that is suitable for use on the internet.

Example: Generated Output in a META Declaration for an ODS MARKUP Statement

```html
<META http-equiv="Content-Type" content="text/html; charset=utf-8">
```

**Conceptual Information:**
- Chapter 3, “Encoding for NLS,” on page 9

**Statements:**

---

**Collating Sequence Option Statement**

Specifies the collating sequence for PROC SORT.

Valid in: PROC SORT statement

Note: The PROC SORT statement sorts observations in a SAS data set by one or more characters or numeric variables.

**Syntax**

```plaintext
PROC SORT collating-sequence-option <other options> ;
```

**Options**

Options can include one *collating-sequence-option* and multiple *other options*. The order of the two types of options does not matter and both types are not necessary in the same PROC SORT step. Only the explanations for the PROC SORT collating-sequence-options follow.
Operating Environment Information: For information about behavior specific to your operating environment for the DANISH, FINNISH, NORWEGIAN, or SWEDISH collating-sequence-option, see the SAS documentation for your operating environment.

**ASCII**
sorts character variables using the ASCII collating sequence. You need this option only when you want to achieve an ASCII ordering on a system where EBCDIC is the native collating sequence.

**DANISH NORWEGIAN**
sorts characters according to the Danish and Norwegian

The Danish and Norwegian collating sequence is shown in Figure 17.6 on page 723.

**EBCDIC**
sorts character variables using the EBCDIC collating sequence. You need this option only when you want to achieve an EBCDIC ordering on a system where ASCII is the native collating sequence.

**POLISH**
sorts characters according to the Polish convention.

**FINNISH SWEDISH**
sorts characters according to the Finnish and Swedish convention. The Finnish and Swedish collating sequence is shown in Figure 17.6 on page 723.

**NORWEGIAN**
See DANISH

**SWEDISH**
See FINNISH

**SORTSEQ=collating-sequence**
specifies the collating sequence. The *collating-sequence* can be a collating-sequence-option, a translation table, an encoding, or the keyword LINGUISTIC. Only one collating sequence can be specified. For more information, see "Collating Sequence" on page 15.

Here are descriptions of the collating sequences:

**collating—sequence—option | translation_table**
specifies either a translation table, which can be one that SAS provides or any user-defined translation table, or one of the PROC SORT statement Collating-Sequence-Options. For an example of using PROC TRANTAB and PROC SORT with SORTSEQ=, see "Example 6: Using Different Translation Tables for Sorting" on page 801.

The available translation tables are

- ASCII
- DANISH
- EBCDIC
- FINNISH
- ITALIAN
- NORWEGIAN
- POLISH
- REVERSE
SPANISH

SWEDISH

The following figure shows how the alphanumeric characters in each language sorts:

**Figure 17.1 Alphanumeric Characters Sorted for Each Language**

<table>
<thead>
<tr>
<th>Language</th>
<th>Sorted Characters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Danish</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz</td>
</tr>
<tr>
<td>Finnish</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZäööëüû</td>
</tr>
<tr>
<td>Italian</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZàèìòùç</td>
</tr>
<tr>
<td>Norwegian</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZåæø</td>
</tr>
<tr>
<td>Spanish</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZáéíóúñ</td>
</tr>
<tr>
<td>Swedish</td>
<td>0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZåäö</td>
</tr>
</tbody>
</table>

**Restriction**
You can specify only one collating-sequence-option in a PROC SORT step.

**Tip**
The SORTSEQ= collating sequence options are specified without parenthesis and have no arguments that are associated with them. An example of how to specify a collating sequence follows:

```sas
proc sort data=mydata SORTSEQ=ASCII;
```

**encoding-value**

specifies an encoding value. The result is the same as a binary collation of the character data represented in the specified encoding. See the supported encoding values in "SBCS, DBCS, and Unicode Encoding Values for Transcoding Data" on page 827.

**Restriction**
PROC SORT is the only procedure or part of the SAS system that recognizes an encoding specified for the SORTSEQ= option.

**Tip**
When the encoding value contains a character other than an alphanumeric character or underscore, the value needs to be enclosed in quotation marks.

**See**
The list of the encodings that can be specified in "SBCS, DBCS, and Unicode Encoding Values for Transcoding Data" on page 827.

**LINGUISTIC**(collating—rules)

specifies linguistic collation, which sorts characters according to rules of the specified language. The rules and default collating sequence options are based on the language specified in the current locale setting. The implementation is provided by the International Components for Unicode (ICU) library and produces results that are largely compatible with the Unicode Collation Algorithms (UCA).

**Alias**
UCA

**Restriction**
The SORTSEQ=LINGUISTIC option is available only on PROC SORT and PROC SQL. Collating rules are supported for PROC SORT, not for the system option or SORTSEQ= on PROC SQL.

**Note**
Linguistic collation can be specified using the SORTSEQ= option in the SQL Procedure and by specifying system option
SORTSEQ=LINGUISTIC. For more information, see "SORTSEQ= System Option: UNIX, Windows, and z/OS" on page 706 and "SORT Procedure" in Base SAS Procedures Guide.

Tips

LINGUISTIC sorting requires more memory with the z/OS mainframe. You might need to set your REGION to 50M or higher. This action must be done in JCL, if you are running in batch mode, or in the VERIFY screen if you are running interactively. This action allows the ICU libraries to load properly and does not affect the memory that is used for sorting.

The collating-rules must be enclosed in parentheses. More than one collating rule can be specified.

When BY processing is performed on data sets that are sorted with linguistic collation, the NOBYSORTED system option might need to be specified in order for the data set to be treated properly. BY processing is performed differently than collating sequence processing.

See

The "ICU License" in SAS Companion for z/OS

The "Collating Sequence" on page 15 for detailed information about linguistic collation.

"SORTSEQ=sort-table | LINGUISTIC" in SAS SQL Procedure User’s Guide for information about linguistic sorting in PROC SORT.

Here are the collation-rules that can be specified for the LINGUISTIC option. These rules modify the linguistic collating sequence:

**ALTERNATE_HANDLING=SHIFTED**

controls the handling of variable characters like spaces, punctuation, and symbols. When this option is not specified (using the default value Non-Ignorable), differences among these variable characters are of the same importance as differences among letters. If the ALTERNATE_HANDLING option is specified, these variable characters are of minor importance.

Default NON_IGNORABLE

Tip The SHIFTED value is often used in combination with STRENGTH= set to Quaternary. In such a case, whitespace characters, punctuation, and symbols are considered when comparing strings, but only if all other aspects of the strings (base letters, accents, and case) are identical.

**CASE_FIRST=**

specify order of uppercase and lowercase letters. This argument is valid for only TERTIARY, QUATERNARY, or IDENTICAL levels. The following table provides the values and information for the CASE_FIRST argument:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPPER</td>
<td>Sorts uppercase letters first, then the lowercase letters.</td>
</tr>
<tr>
<td>LOWER</td>
<td>Sorts lowercase letters first, then the uppercase letters.</td>
</tr>
</tbody>
</table>

**COLLATION=**
The following table lists the available COLLATION= values: If you do not select a collation value, then the user's locale-default collation is selected.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIG5HAN</td>
<td>specifies pinyin ordering for Latin and specifies big5 charset ordering for Chinese, Japanese, and Korean characters.</td>
</tr>
<tr>
<td>DIRECT</td>
<td>specifies a Hindi variant.</td>
</tr>
<tr>
<td>GB2312HAN</td>
<td>specifies pinyin ordering for Latin and specifies gb2312han charset ordering for Chinese, Japanese, and Korean characters.</td>
</tr>
<tr>
<td>PHONEBOOK</td>
<td>specifies a telephone-book style for ordering of characters. Select PHONEBOOK only with the German language.</td>
</tr>
<tr>
<td>PINYIN</td>
<td>specifies an ordering for Chinese, Japanese, and Korean characters based on character-by-character transliteration into pinyin. This ordering is typically used with simplified Chinese.</td>
</tr>
<tr>
<td>POSIX</td>
<td>is the Portable Operating System Interface. This option specifies a &quot;C&quot; locale ordering of characters.</td>
</tr>
<tr>
<td>STROKE</td>
<td>specifies a nonalphabetic writing style ordering of characters. Select STROKE with Chinese, Japanese, Korean, or Vietnamese languages. This ordering is typically used with Traditional Chinese.</td>
</tr>
<tr>
<td>TRADITIONAL</td>
<td>specifies a traditional style for ordering of characters. For example, select TRADITIONAL with the Spanish language.</td>
</tr>
</tbody>
</table>
**LOCALE=**locale_name

specifies the locale name in the form of a POSIX name. For example, ja_JP. See the "LOCALE= Values for PAPERSIZE and DFLANG, Options" on page 809 for a list of locale and POSIX values supported by PROC SORT.

**Restriction** The following locales are not supported by PROC SORT:
- Afrikaans_SouthAfrica, af_ZA
- Cornish_UnitedKingdom, kw_GB

**NUMERIC_COLLATION=**

orders integer values within the text by the numeric value instead of characters used to represent the numbers.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>Order numbers by the numeric value. For example, &quot;8 Main St.&quot; would sort before &quot;45 Main St.&quot;.</td>
</tr>
<tr>
<td>OFF</td>
<td>Order numbers by the character value. For example, &quot;45 Main St.&quot; would sort before &quot;8 Main St.&quot;.</td>
</tr>
</tbody>
</table>

**Default** OFF

**STRENGTH=**

The value of strength is related to the collation level. There are five collation-level values. The following table provides information about the five levels. The default value for strength is related to the locale.

<table>
<thead>
<tr>
<th>Value</th>
<th>Type of Collation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIMARY or 1</td>
<td>PRIMARY specifies differences between base characters (for example, &quot;a&quot; &lt; &quot;b&quot;).</td>
<td>It is the strongest difference. For example, dictionaries are divided into different sections by base character.</td>
</tr>
<tr>
<td>SECONDARY or 2</td>
<td>Accents in the characters are considered secondary differences (for example, &quot;as&quot; &lt; &quot;âs&quot; &lt; &quot;at&quot;).</td>
<td>A secondary difference is ignored when there is a primary difference anywhere in the strings. Other differences between letters can also be considered secondary differences, depending on the language.</td>
</tr>
</tbody>
</table>
The collating sequence option in the PROC SORT statement sorts observations in a SAS data set by one or more characters or numeric variables.

**Table 17.1 Options**

<table>
<thead>
<tr>
<th>Task</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>

- “TRANTAB= System Option” on page 709

CORRECTENCODING= Option Statement
Explicitly changes the encoding attribute of a SAS file to match the encoding of the data in the SAS file.

Valid in: MODIFY statement of the DATASETS procedure

Syntax

```
MODIFY SAS file /*<CORRECTENCODING=encoding-value> */;
```
Optional Argument

\(<CORRECTENCODING=encoding-value>\> \n
enables you to change the encoding indicator, which is recorded in the file's descriptor information, in order to match the actual encoding of the file's data. You cannot use this option in parenthesis after the name of each SAS file; you must specify CORRECTENCODING= after the forward slash. For example:

```
modify mydata / correctencoding=latin2;
```

For a list of valid encoding values for transcoding, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

Restriction CORRECTENCODING= can be used only when the SAS file uses the default base engine, which is V9 in SAS 9.

Example: Using the CORRECTENCODING= Option to Resolve a SAS Session Encoding and a SAS File Encoding

A file's encoding indicator can be different from the data's encoding. For example, a SAS file that was created before SAS 9 has no encoding indicator stored on the file. If such a SAS file that has no recorded encoding is opened in a SAS 9 session, SAS assigns the encoding of the current session. For example, if the encoding of the data is Danish EBCDIC, but the encoding for the current session is Western Wlatin1, then the actual encoding of the file's data and the encoding indicator that is stored in the file's descriptor information do not match. When this action occurs, the data does not transcode correctly and could result in unreadable output. The following MODIFY statement would resolve the problem by explicitly assigning an EDCDIC encoding:

```
proc datasets library=myfiles;
   modify olddata / correctencoding=ebcdic1142;
quit;
```

Note: CEDA creates a read-only copy. You need to copy the data with PROC COPY or a DATA step to transcode the data permanently.

CVPBYTES=, CVPENGINE=, CVPFORMATWIDTH=, CVPMULTIPLIER=, CVPVARCHAR=, CVPEXCLUDE=, CVPINCLUDE= Statement

Specifies attributes for character variables that are needed to transcode a SAS file.

Restriction: The CVPEXCLUDE= and CVPINCLUDE= options are available only in SAS Viya 3.5.

Valid in: LIBNAME statement

Category: Data Access

PROC OPTIONS GROUP=

PROC LIBNAME statement under Windows, UNIX, and Z/OS in the documentation for your operating environment.

See: LIBNAME, SAS/ACCESS
Syntax

LIBNAME libref 'SAS data-library' <CVPBYTES=bytes> <CVPENGINE=engine>
<CVPEXCLUDE=variable expression><CVPFORMATWIDTH=YES|NO><CVPINCLUDE=variable expression><CVPMULTIPLIER=multiplier>
<CVPVARCHAR=YES | NO>;

Optional Arguments

CVPBYTES=bytes
specifies the number of bytes by which to expand character variable lengths when processing a SAS data file that requires transcoding. The CVP engine expands the lengths so that character data truncation does not occur. The lengths for character variables are increased by adding the specified value to the current length. You can specify a value from 0 to 32,766.

For example, the following LIBNAME statement implicitly assigns the CVP engine by specifying the CVPBYTES= option:

libname expand 'SAS data-library' cvpbytes=5;

Character variable lengths are increased by adding 5 bytes. A character variable with a length of 10 is increased to 15, and a character variable with a length of 100 is increased to 105.

Default
If you specify CVPBYTES=, SAS automatically uses the CVP engine to expand the character variable lengths according to your specification. If you explicitly assign the CVP engine but do not specify either CVPBYTES= or CVPMULTIPLIER=, then SAS uses CVPMULTIPLIER=1.5 to increase the lengths of the character variables.

Restrictions
The CVP engine supports SAS data files, no SAS views, catalogs, item stores, and so on.

The CVP engine is available for input (read) processing only.

For library concatenation with mixed engines that include the CVP engine, only SAS data files are processed. For example, if you execute the COPY procedure, only SAS data files are copied.

Requirement
The number of bytes that you specify must be large enough to accommodate any expansion. Otherwise, truncation occurs, which results in an error message in the SAS log.

Interaction
You cannot specify both the CVPBYTES= option and the CVPMULTIPLIER= option. Specify only one of these options.

See
“Avoiding Character Data Truncation By Using the CVP Engine” on page 41

CVPENGINE=engine
specifies the engine to use to process a SAS data file that requires transcoding. The CVP engine expands the character variable lengths to transcoding so that character data truncation does not occur. Then the specified engine processes the actual file.
**CVPINCLUDE=variable expression**
specifies the variables that are included during data processing. Only the specified variables can be processed.

CVPINCLUDE= and CVPEXCLUDE= cannot be used together. If both options are omitted, then all variables are processed.

Note: The CVPEXCLUDE= and CVPINCLUDE= options are available only in Viya 3.5.

**CVPMULTIPLIER=multiplier**
specifies a multiplier value that expands character variable lengths when you are processing a SAS data file that requires transcoding. The CVP engine expands the lengths so that character data truncation does not occur. The lengths for character variables are increased by multiplying the current length by the specified value. You can specify a multiplier value from 1 to 5 or you can specify 0 and then the CVP engine determines the multiplier automatically.

For example, the following LIBNAME statement implicitly assigns the CVP engine by specifying the CVPMULTIPLIER= option:

```
libname expand 'SAS data-library' cvpmultiplier=2.5;
```
Character variable lengths are increased by multiplying the lengths by 2.5. A character variable with a length of 10 is increased to 25, and a character variable with a length of 100 is increased to 250.

**Alias**

CVPMULT

**Default**

If you specify the CVPMULTIPLIER= option, SAS automatically uses the CVP engine to expand the character variable lengths according to your specification. If you explicitly specify the CVP engine but do not specify either the CVPMULTIPLIER= option or the CVPBYTES= option, then SAS uses CVPMULTIPLIER=AUTO(0) to increase the lengths. AUTO(0) sets the value of the CVP engine based on the encoding of the SAS session and input data set.

**Restrictions**

The CVP engine supports SAS data files, no SAS views, catalogs, item stores, and so on.

The CVP engine is available for input (read) processing only.

For library concatenation with mixed engines that include the CVP engine, only SAS data files are processed. For example, if you execute the COPY procedure, only SAS data files are copied.

**Requirement**

The number of bytes that you specify must be large enough to accommodate any expansion. Otherwise, truncation occurs, which results in an error in the SAS log.

**Interaction**

You cannot specify both the CVPMULTIPLIER= option and the CVPBYTES= option. Specify only one of these options.

**See**

"Avoiding Character Data Truncation By Using the CVP Engine" on page 41

**CVPVARCHAR=**

Y**ES | NO**

specifies whether to convert fixed-width character variables to variable-width characters during input file processing. The byte length of the new-width character variable is the maximum number of bytes per character from the SAS session encoding multiplied by the specified fixed-width character length.

**Default**

No

**Interaction**

If you specify CVPVARCHAR=**YES**, the CVPMULTIPLIER= and CVPBYTES= options are ignored.

**Notes**

Trailing blanks are removed from string data that is under CHAR columns.

Fixed-width character variables with a format of TRANSCODE=**NO** are excluded during conversion.

**Details**

The character variable padding (CVP) engine converts variables defined with the CHAR to a VARCHAR data type when **CVPVARCHAR=****YES**. Because CVP is available only for input processing, the VARCHAR data type is not automatically saved.
Without saving the data, the conversion to VARCHAR is lost when a SAS session ends. To save the changes, use the SET statement or PROC COPY and an engine that supports VARCHAR. If the data is saved using an engine that does not support VARCHAR, such as the BASE engine, the character columns in the new data set revert to the CHAR data type. The length of the CHAR variables in the new data set is the number of bytes that is needed to store the VARCHAR.

For more information about VARCHAR, see “VARCHAR Data Type in String Functions” on page 369.

If the data is read by a procedure that does not support VARCHAR, CVPVARCHAR=YES is ignored. The CVP engine uses CVPBYTES, CVPMULTIPLIER, or the default multiplier to expand the length of the character columns in the data.

Example: Using the CVP Engine

The following example illustrates how to avoid character data truncation by using the CVP engine. The example uses a SAS data set named MYFILES.WLATIN2, which contains some national characters in the Wlatin2 encoding. The data set is created in SAS 9 in an SBCS session. This code sample is run in SAS9.

libname myfiles 'SAS Data-Library';
data myfiles.wlatin2 (encoding=wlatin2);
  var1='A';
  var2='Š';
  var3='ś';
  var4='ł';
;
proc print data=myfiles.wlatin2;
run;

Here is the PROC CONTENTS output for MYFILES.WLATIN2 that was run in SAS 9, which shows that the encoding is WLatin2 and the length for each character variable is 1 byte:
Output 17.1  PROC CONTENTS Output for MYFILES.WLATIN2

<table>
<thead>
<tr>
<th>Data Set Name</th>

<tr>
<td>-----</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
</tbody>
</table>
The following code is executed with the session encoding WLatin2.

```sas
options msglevel=i;
libname myfiles 'SAS Data-Library';
data myfiles.utf8 (encoding="utf-8");
  set myfiles.wlatin2;
run;
```

The DATA step requests a new data set named MYFILES.UTF8. It also requests that the data be read into the new data set in the UTF-8 encoding, which means that the data must be transcoded from WLatin2 to UTF-8. The request results in errors when the transcoding truncates the character data. The new data set MYFILES.UTF8 is created but does not contain any data.

**Example Code 17.1  SAS Log with Transcoding Error**

```
INFO: Data file MYFILES.UTF8.DATA is in a format native to another host, or the file encoding does not match the session encoding. Cross Environment Data Access will be used, which might require additional CPU resources and might reduce performance.
ERROR: Some character data was lost during transcoding in the dataset MYFILES.UTF8. Either the data contains characters that are not representable in the new encoding or truncation occurred during transcoding.
NOTE: The data step has been abnormally terminated.
NOTE: The SAS System stopped processing this step because of errors.
NOTE: There were 1 observations read from the data set MYFILES.WLATIN2.
WARNING: The data set MYFILES.UTF8 may be incomplete. When this step was stopped there were 0 observations and 4 variables.
```

The following code is executed and expands the variable lengths:

```sas
options msglevel=i;
libname myfiles 'SAS Data-Library';
libname expand cvp 'SAS Data-Library' cvpbytes=2;
data myfiles.utf8 (encoding="utf-8");
  set expand.wlatin2;
run;
```

In this example, the CVP engine expands character variable lengths by adding 2 bytes to each length. The data is read into the new file in UTF-8 encoding by transcoding from WLatin2 to UTF-8. There is no data truncation due to the expanded character variable lengths, and the new data set is successfully created:
Example Code 17.2  SAS Log Output for MYFILES.UTF8

```
57     options msglevel=i;
58     libname myfiles 'C:\SAS Data-Library';

NOTE: Libref MYFILES was successfully assigned as follows:
       Engine:        V9
       Physical Name:  C:\SAS Data-Library

59     libname expand cvp 'C:\SAS Data-Library' cvpbytes=2;
WARNING: Libref EXPAND refers to the same physical library as MYFILES.
NOTE: Libref EXPAND was successfully assigned as follows:
       Engine:        CVP
       Physical Name: 'C:\SAS Data-Library'

60     data myfiles.utf8 (encoding="utf-8");
61        set expand.wlatin2;

INFO: Data file EXPAND.WLATIN2.DATA is in a format that is native to another host,
or the file encoding does not match the session encoding. Cross Environment Data Access will be used, which might require additional CPU resources and might reduce performance.
62     run;

NOTE: There were 1 observations read from the data set EXPAND.WLATIN2.
NOTE: The data set MYFILES.UTF8 has 1 observations and 4 variables.
```

Finally, here is PROC CONTENTS output for MYFILES.UTF8 showing that it is in the UTF-8 encoding and that the length of each character variable is 3:
## Output 17.2  PROC CONTENTS Output for MYFILES.UTF8

ENCODING= Option Statement

Overrides and transcodes the encoding for input or output processing of external files.

Valid in:  
- %INCLUDE statement; FILE statement; FILENAME statement; FILENAME statement, EMAIL (SMTP) Access Method; INFILE statement; ODS statements; FILE command; INCLUDE command

Category:  
Data Access

Syntax

ENCODING= 'encoding-value'

Optional Argument

ENCODING= 'encoding-value'

specifies the encoding to use for reading, writing, copying, or saving an external file. The value for ENCODING= indicates that the external file has a different encoding from the current session encoding.

When you read, write, copy, or save data using an external file, SAS transcodes the data from the session encoding to the specified encoding.

For details, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

Default  
SAS uses the current session encoding.

Details

The following table provides information about how the ENCODING option is used with the corresponding statement:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%INCLUDE statement</td>
<td>reads SAS statements and data lines from the specified source file (not supported under z/OS).</td>
</tr>
<tr>
<td>FILE statement</td>
<td>writes to an external file.</td>
</tr>
<tr>
<td>FILENAME statement</td>
<td>reads from or writes to an external file.</td>
</tr>
<tr>
<td>FILENAME statement, EMAIL (SMTP) Access Method</td>
<td>sends electronic mail programmatically.</td>
</tr>
<tr>
<td>INFILE statement</td>
<td>reads from an external file.</td>
</tr>
<tr>
<td>ODS statements</td>
<td>controls features of the Output Delivery System that are used to generate, store, or reproduce SAS procedure and DATA step output.</td>
</tr>
</tbody>
</table>
FILE command: saves the contents of a window to an external file.

INCLUDE command: Copies an external file into the current window.

Some encodings use a Byte-Order Mark (BOM). The BOM is generated when the encoding is specified. For the UTF-8 encoding, you must specify encoding=utf-8 on the filename and file DATA step statements in order for the BOM to be generated.

Examples:

Example 1: Using the FILE Statement to Specify an Encoding for Writing to an External File
This example creates an external file from a SAS data set. The current session encoding is WLatin1, but the external file's encoding needs to be UTF-8. By default, SAS writes the external file using the current session encoding.

To specify what encoding to use for writing data to the external file, specify the ENCODING= option:

```sas
libname myfiles 'SAS data-library';
filename outfile 'external-file';
data _null_;  
  set myfiles.cars;
  file outfile encoding="utf-8";
  put Make Model Year;
run;
```

When you tell SAS that the external file is to be in UTF-8 encoding, SAS then transcodes the data from WLatin1 to the specified UTF-8 encoding.

Example 2: Using the FILENAME Statement to Specify an Encoding for Reading an External File
This example creates a SAS data set from an external file. The external file is in UTF-8 character-set encoding, and the current SAS session is in the WLatin1 encoding. By default, SAS assumes that an external file is in the same encoding as the session encoding, which causes the character data to be written to the new SAS data set incorrectly.

To specify which encoding to use when reading the external file, specify the ENCODING= option:

```sas
libname myfiles 'SAS data-library';
filename extfile 'external-file' encoding="utf-8";
data myfiles.unicode;
  infile extfile;
  input Make $ Model $ Year;
run;
```

When you specify that the external file is in UTF-8, SAS then transcodes the external file from UTF-8 to the current session encoding when writing to the new SAS data set. Therefore, the data is written to the new data set correctly in WLatin1.
Example 3: Using the FILENAME Statement to Specify an Encoding for Writing to an External File

This example creates an external file from a SAS data set. By default, SAS writes the external file using the current session encoding. The current session encoding is Wlatin1, but the external file's encoding needs to be UTF-8.

To specify which encoding to use when writing data to the external file, specify the ENCODING= option:

```sas
libname myfiles 'SAS data-library';
filename outfile 'external-file' encoding="utf-8";
data _null_;  
  set myfiles.cars;
  file outfile;
  put Make Model Year;
run;
```

When you specify that the external file is to be in UTF-8 encoding, SAS then transcodes the data from Wlatin1 to the specified UTF-8 encoding when writing to the external file.

Example 4: Changing Encoding for Message Body and Attachment

This example illustrates how to change text encoding for the message body as well as for the attachment.

```sas
filename mymail email 'Joe.Developer@sas.com';
data _null_;  
  file mymail
    subject='Text Encoding'
    encoding=greek
    attach=('C:\My Files\Test.out'
      content_type='text/plain'
      encoding='ebcdic1047'
      outencoding='latin1');
run;
```

In the program, the following occurs:

- The ENCODING= email option specifies that the message body is encoded to Greek (ISO) before being sent.
- For the ATTACH= email option, the attachment option ENCODING= specifies the encoding of the attachment that is read into SAS, which is Western (EBCDIC).
- Because SMTP and other email interfaces do not support EBCDIC, the attachment option OUTENCODING= converts the attachment to Western (ISO) before sending it.

Example 5: Using the INFILE= Statement to Specify an Encoding for Reading from an External File

This example creates a SAS data set from an external file. The external file's encoding is in UTF-8, and the current SAS session encoding is Wlatin1. By default, SAS assumes that the external file is in the same encoding as the session encoding, which causes the character data to be written to the new SAS data set incorrectly.
To specify which encoding to use when reading the external file, specify the ENCODING= option:

```sas
libname myfiles 'SAS data-library';
filename extfile 'external-file';
data myfiles.unicode;
  infile extfile encoding="utf-8";
  input Make $ Model $ Year;
run;
```

When you specify that the external file is in UTF-8, SAS then transcodes the external file from UTF-8 to the current session encoding when writing to the new SAS data set. Therefore, the data is written to the new data set correctly in WLatin1.

INENCODING= Statement

OUTENCODING= Options Statement

Overrides and changes the encoding when reading or writing SAS data sets in the SAS library.

Valid in: LIBNAME statement
Category: Data Access

Syntax

```
INENCODING= ANY | ASCIIANY | EBCDICANY | encoding-value
OUTENCODING= ANY | ASCIIANY | EBCDICANY | encoding-value
```
Syntax Description

**ANY**
specifies no transcoding between ASCII and EBCDIC encodings.

*NOTE:* ANY is a synonym for binary. Because the data is binary, the actual encoding is irrelevant.

**ASCIIANY**
specifies that no transcoding occurs, assuming that the mixed encodings are ASCII encodings.

**EBCDICANY**
specifies that no transcoding occurs, assuming that the mixed encodings are EBCDIC encodings.

**encoding-value**
specifies an encoding value. For a list of encoding values, see Chapter 23, "Encoding Values in SAS Language Elements," on page 827.

Details

The INENCODING= option is used to read SAS data sets in the SAS library. The OUTENCODING= option is used to write SAS data sets in the SAS library.

The INENCODING= value or the OUTENCODING= value is written to the SAS log when you use the LIST argument.

INENCODING= and OUTENCODING= are most appropriate when using an existing library that contains mixed encodings. To read a library that contains mixed encodings, you can set INENCODING= to ASCIIANY or EBCDICANY. To write a separate data set, you can use OUTENCODING= to specify a specific encoding, which is applied to the data set when it is created.

Comparisons

- Session encoding is specified using the ENCODING= system option.
- You can specify the encoding for reading data sets in a SAS library by using the LIBNAME statement INENCODING= option for input files. If both the LIBNAME statement option and the ENCODING= data set option are specified, SAS uses the data set option.
- You can specify the encoding for writing data sets to a SAS library by using the LIBNAME statement OUTENCODING= option for output files. If both the LIBNAME statement option and the ENCODING= data set option are specified, SAS uses the data set option.
- For the COPY procedure, the default CLONE option uses the encoding attribute of the input data set instead of the encoding value specified on the OUTENCODING= option. For more information about CLONE and NOCLONE, see COPY Statement.

*Note:* This interaction does not apply when using SAS/CONNECT or SAS/SHARE.
ODSCHARSET= Option Statement

Specifies the character set to be generated in the META declaration for the output.

Valid in: LIBNAME statement for the XML V2 engine
Category: Data Access

Syntax

ODSCHARSET=character-set;

Required Argument

character-set

For the LIBNAME statement for the XML engine, specifies the character set to use in the ENCODING= attribute.

An example of an encoding is ISO-8859-1. Official character sets for use on the Internet are registered by IANA (Internet Assigned Numbers Authority). IANA is the central registry for various Internet protocol parameters, such as port, protocol and enterprise numbers, options, codes, and types. For a complete list of character-set values, see www.unicode.org/reports/tr22/index.html and www.iana.org/assignments/character-sets.

A character set is like an encoding-value in this context. However, character set is the term that is used to identify an encoding that is suitable for use on the Internet.

Details

An XML declaration is not required in all XML documents. Such a declaration is required only when the character encoding of the document is other than the default UTF-8 or UTF-16 and no encoding was determined by a higher-level protocol.

The ODSCHARSET option, in the LIBNAME statement for the XML engine, specifies the character set to use for generating an output XML document.
ODSTRANTAB= Option Statement

Specifies the translation table to use when transcoding an XML document for an output file.

Valid in: the LIBNAME statement for the XML V2engine
Category: Data Access

Syntax

TRANTAB = 'translation-table'

Optional Argument

translation-table

specifies the translation table to use for the output file. The translation table is an encoding method that maps characters (letters, logograms, digits, punctuation, symbols, control characters, and so on) in the character set to numeric values. An example of a translation table is one that converts characters from EBCDIC to ASCII-ISO. The table-name can be any translation table that SAS provides, or any user-defined translation table. The value must be the name of a SAS catalog entry in either the SASUSER.PROFILE catalog or the SASHELP.HOST catalog.

Details

For SAS 9.2, using the ODSTRANTAB= option in the LIBNAME statement for the XML Engine is supported for backward compatibility. The preferred method for specifying an encoding is to use the LOCALE= system option.

- “LOCALE System Option” on page 696
TRANSCODE= Column Modifier on PROC SQL

Specifies whether values can be transcoded for character columns.

Valid in: Column modifier component in the SQL Procedure

Syntax

TRANSCODE=YES|NO

Required Argument

TRANSCODE=YES | NO

for character columns, specifies whether values can be transcoded. Use TRANSCODE=NO to suppress transcoding. Note that when you create a table using the CREATE TABLE AS statement, the transcoding attribute for a particular character column in the created table is the same as it is in the source table unless you change it with the TRANSCODE= column modifier.

Default YES

Restriction Suppression of transcoding is not supported for the V6TAPE engine.

Conceptual Information:

- Chapter 4, “Transcoding for NLS,” on page 31

RENCODING= Option Statement

Specifies the ASCII-based or EBCDIC-based encoding to use for transcoding data for a SAS/SHARE server session that is using an EBCDICANY or ASCIIANY session encoding.

Valid in: LIBNAME statement for SAS/SHARE only

Category: Data Access

Note: The RENCODING= option in the LIBNAME statement is relevant only if using a SAS/SHARE server that has a session encoding set to EBCDICANY or ASCIIANY to preserve a mixed-encoding computing environment.

See: LIBNAME statement in SAS/SHARE User's Guide
Syntax

RENCODING=ASCII-encoding-value | EBCDIC-encoding-value

Syntax Description

**ASCII-encoding-value**

For a list of valid values for ASCII encodings for UNIX and Windows, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

**EBCDIC-encoding-value**

For a list of valid values for EBCDIC encodings for z/OS, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

Details

If you use SAS/SHARE in a mixed-encoding environment (for example, SAS/SHARE client sessions using incompatible encodings such as Latin1 and Latin2), you can set the following options:

- in the SAS/SHARE server session, set the SAS system option ENCODING=EBCDICANY or ENCODING=ASCIIANY
- in the SAS/SHARE client session, set the RENCODING= option in the LIBNAME statement(s) under these conditions:
  - a client session that uses an ASCII-based encoding accesses an EBCDICANY server
  - a client session that uses an EBCDIC-based encoding accesses an ASCIIANY server.

The RENCODING= option enables SAS/SHARE clients to specify which encoding to assume the server's data is in when transcoding to or from the client session encoding.

For SAS 9, if you are processing data in a SAS/SHARE client/server session from more than one SBCS or DBCS encoding, you are advised to use the UTF8 encoding. For more information about Unicode servers that run the UTF8 session encoding, go to [http://rnd.sas.com/sites/i18n/i18ndocs/i18nsupport/Pages/SAS%20Technical%20Papers.aspx](http://rnd.sas.com/sites/i18n/i18ndocs/i18nsupport/Pages/SAS%20Technical%20Papers.aspx) and search for *Processing Multilingual Data with the SAS® 9.2 Unicode Server and Multilingual Computing with SAS® 9.4*.

Comparisons

In SAS 9, you can maintain multilingual data that contains characters from more than one traditional SBCS or DBCS encoding in a SAS data set by using a UTF8 encoding. To share Update access to that data using SAS/SHARE, you must also run the SAS/SHARE server using a session encoding of UTF8. SAS transcodes the data to the client encoding if necessary.

Prior to SAS 9, if a SAS/SHARE client and a SAS/SHARE server ran on common architectures (for example, the client and server ran on UNIX machines), there was no automatic transcoding of character data. It was possible to build applications that accessed data sets in different EBCDIC or ASCII encodings within a single SAS/SHARE server, or that accessed data sets in mixed different encodings within a single data set. This method was very uncommon and required careful
programming to set up transcoding tables from clients that ran in different operating environments.

The following steps describe how you can maintain mixed encoding in SAS 9, if necessary.

- The SAS/SHARE server must run by using a session encoding of EBCDICANY for mixed-EBCDIC encodings or ASCIIANY for mixed-ASCII encodings.

  This restores the behavior of Version 8 and earlier releases and prevent the automatic character transcoding between different client and server encodings in the same EBCDIC or ASCII family. That is, no transcoding occurs under these circumstances:
  - if the client session encoding is an EBCDIC encoding and the server session encoding is EBCDICANY
  - if the client session encoding is an ASCII encoding and the server session encoding is ASCIIANY.

- A SAS/SHARE client that does not share the same encoding family as an ASCIIANY or EBCDICANY server can control the necessary transcoding by using an RENCODING= option on the first LIBNAME statement that accesses the server.

  For example, an ASCII client that runs in a Polish locale could access a z/OS EBCDICANY server and specify RENCODING=EBCDIC870 to access data that the client knows contains Polish-encoded data. Another ASCII client that runs in a German locale could access the same z/OS EBCDICANY server and specify RENCODING=EBCDIC1141 to access data that the client knows contains German data. Similarly, EBCDIC clients that access an ASCIIANY server can specify the precise ASCII encoding of the data that they are accessing by using the RENCODING= option in the LIBNAME statement.

See Also

**Conceptual Information:**
- “Overview of Transcoding” on page 31

---

**TRANSCODE= Option Statement**

Specifies an attribute in the ATTRIB statement (which associates a format, informat, label, and length with one or more variables) that indicates whether character variables are to be transcoded.

**Valid in:**
- the ATTRIB statement in a DATA step

**Category:** Information

**Type:** Declarative

**See:**
- ATTRIB Statement under *Windows UNIX z/OS* in the documentation for your operating environment.

**Syntax**

```
ATTRIB variable-list(s) attribute-list(s) ;
```
Required Arguments

**variable-list**
names the variables that you want to associate with the attributes.

**Tip** List the variables in any form that SAS allows.

**attribute-list**
specifies one or more attributes to assign to **variable-list**. Multiple attributes can be specified in the ATTRIB statement. For a complete list of attributes, see the “ATTRIB Statement” in *SAS DATA Step Statements: Reference*.

**TRANSCODE= YES | NO**
Specifies whether to transcode character variables. Use TRANSCODE=NO to suppress transcoding. For more information, see “Overview of Transcoding” on page 31.

**Default** YES

**Restriction** The TRANSCODE=NO attribute is not supported by some SAS Workspace Server clients. Variables with TRANSCODE=NO are not returned in SAS 9.4. Prior to SAS 9.4, variables with TRANSCODE=NO are transcoded. Prior releases of SAS cannot access a SAS 9.4 data set that contains a variable with a TRANSCODE=NO attribute.

**Interactions** You can use the VTRANSCODE and VTRANSCODEX functions to return whether transcoding is on or off for a character variable.

If the TRANSCODE= attribute is set to NO for any character variable in a data set, PROC CONTENTS prints a transcode column that contains the TRANSCODE= value for each variable in the data set. If all variables in the data set are set to the default TRANSCODE= value (YES), no transcode column is printed.

Examples:

**Example 1: Using the TRANSCODE= Option with the SET Statement**
When you use the SET statement to create a data set from several data sets, SAS makes the TRANSCODE= attribute of the variable in the output data set equal to the TRANSCODE= value of the variable in the first data set. In this example, the variable Z's TRANSCODE= attribute in data set A is NO because B is the first data set and Z's TRANSCODE= attribute in data set B is NO.

```sas
data b;
  length z $4;
  z = 'ice';
  attrib z transcode = NO;
data c;
  length z $4;
  z = 'snow';
  attrib z transcode = YES;
data a;
  set b;
```
Example 2: Using the TRANSCODE= Option with the MERGE Statement

When you use the MERGE statement to create a data set from several data sets, SAS makes the TRANSCODE= attribute of the variable in the output data set equal to the TRANSCODE= value of the variable in the first data set. In this example, the variable Z's TRANSCODE= attribute in data set A is YES because C is the first data set and Z's TRANSCODE= attribute in data set C is YES.

data b;
  length z $4;
  z = 'ice';
  attrib z transcode = NO;
data c;
  length z $4;
  z = 'snow';
  attrib z transcode = YES;
data a;
  merge c b;
  /* Check transcode setting for variable Z */
  rc1 = vtranscode(z);
  put rc1=;
run;

Note: The TRANSCODE= attribute is set when the variable is first seen on an input data set or in an ATTRIB TRANSCODE= statement. If a SET or MERGE statement comes before an ATTRIB TRANSCODE= statement and the TRANSCODE= attribute contradicts the SET statement, an error message occurs.

TRANTAB= Option Statement

Specifies the translation table to use when you are transcoding character data.

Valid in: ODS MARKUP statement and ODS RTF statement
Category: ODS: Third-Party Formatted
Syntax

TRANTAB = (translation-table)

Optional Argument

translation-table

specifies the translation table to use for the output file. The translation table is an encoding method that maps characters (letters, logograms, digits, punctuation, symbols, control characters, and so on) in the character set to numeric values. An example of a translation table is one that converts characters from EBCDIC to ASCII-ISO. The table-name can be any translation table that SAS provides, or any user-defined translation table. The value must be the name of a SAS catalog entry in either the SASUSER.PROFILE catalog or the SASHELP.HOST catalog.

Details

In SAS 9.4, the TRANTAB= option in the ODS MARKUP statement is supported for backward compatibility. The ENCODING= option is preferred when specifying the encoding.

See Also

Conceptual Information:
- “Transcoding and Translation Tables” on page 32

Procedures:
- Chapter 20, “TRANTAB Procedure,” on page 781

Statements:

XMLENCODING= Option Statement

Overrides the encoding of an XML document to import or export an external document.

Valid in: LIBNAME statement for the XML engine

Category: Data Access

Syntax

XMLENCODING = 'encoding-value'
Details

The LIBNAME statement for the XML engine, associates a SAS libref with an XML document to import or export an external document.

Comparisons

Options

encoding-value

specifies the encoding to use when you read, write, copy, or save an external file. The value for XMLENCODING= indicates that the external file has a different encoding from the current session encoding.

For details, see “SBCS, DBCS, and Unicode Encoding Values for Transcoding Data” on page 827.

The default for encoding-value is the current session encoding.

See Also

Statements:

- SAS XMLV2 and XML LIBNAME Engines: User’s Guide

TRANTAB Statement

Specifies the translation table to use when you transcode character data in order to export or transfer a SAS file.

Valid in: CPORT Procedure, UPLOAD procedure, DOWNLOAD procedure

Restriction: You can specify only one translation table per TRANTAB statement. To specify additional translation tables, use additional TRANTAB statements.

Interaction: The TRANTAB statement specifies a customized translation table (for example, to map an EBCDIC character to an ASCII character) to apply to the character set in the SAS file that is being exported or transferred. The TRANTAB= system option specifies a translation table to use for the SAS session, including file transfers.

Syntax

TRANTAB NAME=translation-table-name <TYPE=(etype-list) <OPT=DISP | SRC | (DISP SRC)> > ;

Required Argument

NAME=translation-table-name

specifies the name of the translation table to apply to the SAS catalog that you want to export (PROC CPORT) or transfer (PROC UPLOAD or PROC DOWNLOAD). The translation-table-name that you specify as the name of a catalog entry in either your SASUSER.PROFILE catalog or the SASHELP.HOST catalog. The SASUSER.PROFILE catalog is searched first, and then the SASHELP.HOST catalog is searched.
In most cases, the default translation table is the correct one to use, but you might need to apply additional translation tables if, for example, your application requires different national language characters.

You can specify a translation table other than the default in two ways:
- To specify a translation table for an invocation of the procedure, use the TRANTAB statement in the procedure, as appropriate.
- To specify a translation table for your entire SAS session or job (including all file exports or transfers), use the TRANTAB= system option.

Optional Arguments

**TYPE=(etype-list)**
applies the translation table only to the entries with the type or types that you specify. The etype-list can be one or more entry types. Examples of catalog entry types include DATA and FORMAT. If etype-list is a simple entry type, omit the parentheses.

By default, the UPLOAD, DOWNLOAD, and CPORT procedures apply the translation table to all specified catalog entries.

**OPT=DISP | SRC( | )**

- **OPT=DISP** applies the translation table only to the specified catalog entries, which produce window displays.
- **OPT=SRC** applies the translation table only to the specified catalog entries that are of the type SOURCE.
- **OPT=(DISP SRC)** applies the translation table only to the specified catalog entries that either produce window displays or are of type SOURCE.

If you do not specify the OPT= option, the UPLOAD or DOWNLOAD procedure applies the translation table to all of the entries in the catalog that you specify.

**Default** PROC CPORT, PROC UPLOAD, and PROC DOWNLOAD apply the translation table to all entries and data sets in the specified catalog.

**Details**
Translation tables were introduced in SAS 6 to support the requirements of national languages. SAS 8.2 introduced the LOCALE= system option as an improvement on direct use of translation tables. SAS 9.3 supports the TRANTAB statement for backward compatibility. However, using the LOCALE= system option is preferred in later SAS releases. For more information, see TS-639, Data Conversion Issues in V6–V8. This technical support note provides information for customers using non-English languages [http://support.sas.com/techsup/technote/ts639.pdf](http://support.sas.com/techsup/technote/ts639.pdf)

PROC CPORT is used when you transfer a SAS file across a network. PROC UPLOAD and PROC DOWNLOAD are used when you transfer a SAS file across a network.

You must specify the INCAT= and OUTCAT= options in the PROC UPLOAD or PROC DOWNLOAD statement when using the TRANTAB statement.
Examples:

Example 1

The information that follows applies to procedure features:

- **PROC CPORT statement option: FILE=**
- **TRANTAB statement option: TYPE=**

This example shows how to apply a customized translation table to the transport file before PROC CPORT exports it. For this example, assume that you have already created a customized translation table called TTABLE1.

Example 2: Program

Assign library references. The **LIBNAME** and **FILENAME** statements assign a libref for the source library and a fileref for the transport file, respectively.

```
libname source 'C:\sashq\root\pub\pubdoc\doc\901\authoring\proc\miscsrc\sasfiles\cport';
filename tranfile 'trans3';
proc trantab table=ascii;
save table=ttable1;
```

```
libname source 'SAS data-library';
filename tranfile 'transport-file'
    host-options-for-file-characteristics;
```

Apply the translation specifics. The **TRANTAB** statement applies the translation that you specify with the customized translation table TTABLE1. **TYPE=** limits the translation to **FORMAT** entries.

```
proc cport catalog=source.formats file=tranfile;
    trantab name=ttable1 type=(format);
run;
```

Example 3: SAS Log

```
NOTE: Proc CPORT begins to transport catalog SOURCE.FORMATS
NOTE: The catalog has 2 entries and its maximum logical record length is 104.
NOTE: Entry REVENUE.FORMAT has been transported.
NOTE: Entry DEPT.FORMATC has been transported.
```

Procedures for NLS

Chapter 18

DBCSTAB Procedure ........................................ 757

Chapter 19

LOCALEDATA Procedure .................................... 765

Chapter 20

TRANTAB Procedure .......................................... 781
Overview: DBCSTAB Procedure

What Does the DBCSTAB Procedure Do?

The DBCSTAB procedure produces conversion tables for the double-byte character sets (DBCSs) that SAS supports.

Use the DBCSTAB procedure to modify an existing DBCS table when

- the DBCS encoding system that you are using is not supported by SAS
- the DBCS encoding system that you are using has a nonstandard translation table

You might be more likely to use the DBCSTAB procedure when a valid DBCSTYPE= value is not available. These values depend on the operating environment. In such cases, you can use the DBCSTAB procedure to modify a similar translation table, and then you can specify the use of the new table with the TRANTAB option.

Syntax: DBCSTAB Procedure

```
PROC DBCSTAB TABLE=table-name
<BASETYPE=base-type> <CATALOG=<libref.>catalog-name>
<DATA=<libref.>table-name> <DBCSLANG=language>
```
PROC DBCSTAB Statement

Produces conversion tables for double-byte character sets.

Syntax

PROC DBCSTAB TABLE=table-name <options>;

Required Argument

TABLE=table-name specifies the name of the double-byte code table to produce. This table name becomes an entry of type DBCSTAB in the catalog that is specified with the CATALOG= option. By default, the catalog name is Sasuser.DBCS.

Alias NAME=, N=

Optional Arguments

BASETYPE=base-type specifies a base type for the double-byte code table conversion. If you use this option, you reduce the number of tables that are produced.

If you specify BASETYPE=, then all double-byte codes are first converted to the base code, and then they are converted to the required code. If you have \( n \) codes, then there are \( n(n-1) \) conversions that must be made.

Alias BTYPE=

CATALOG=<libref.>catalog-name specifies the name of the catalog in which the table is stored. If the catalog does not exist, it is created.

Default Sasuser.DBCS

DATA=<libref.>table-name specifies the data for producing the double-byte code table. Several double-byte character variables are required to produce the table. Use variable names that are equivalent to the value of the DBCSTYPE= system option and recognized by the KCVT function.

DBCSLANG=language specifies the language that the double-byte code table uses. The value of this option should match the value of the DBCSLANG= system option.

Alias DBLANG=

DESC='description' specifies a text string to put in the DESCRIPTION field for the entry.
FORCE
produces the conversion tables, even if errors are present.

VERIFY
checks the data range of the input table based on the code. This option checks for invalid double-byte code.

VERBOISE
prints the statistics detail when building DBCS tables.

Examples: DBCSTAB Procedure

Example 1: Creating a Conversion Table with the DBCSTAB Procedure

Features:

PROC DBCSTAB statement options:
- CATALOG=
- DBLANG=
- BASETYPE=
- VERIFY

The following example creates a Japanese translation table called CUSTAB and demonstrates how the TRANTAB= option specifies the new translation table. The DBCS=, DBCSLANG=, and DBCSTYPE= options are specified at start-up.

Program

```sas
proc dbcstab
    /* name of the new translate table */
    name=custtab
    /* based on pcibm encoding */
    basetype=pcms
    /* data to create the new table */
    data=trantab
    /* japanese language */
    dbcslang=japanese
    /* catalog descriptor */
    desc='Modified Japanese Trantab'
    /* where the table is stored */
    catalog=sasuser.dbcs
    /* checks for invalid DBCS in the new data */
    verify;
run;
```

Creating a Conversion Table

invoke Japanese SAS with Shift_JIS encoding.
data trantab;
  pcms='8342'x; dec='b9b3'x;
run;
proc dbcstab;
  name=custtab;
  basetype=pcms;
  data=trantab;
  dbcslang=japanese;
  desc='Modified Japanese Trantab';
  catalog=sasuser.dbcs;
  verify;
run;
options trantab=(,,,,,,,,,custtab);

Program Description

Set the SAS environment.

  invoke Japanese SAS with Shift_JIS encoding.

Create the TRANTAB data set.

  data trantab;

Define the pcms and dec parameters and run the code.

  pcms='8342'x; dec='b9b3'x;
  run;

Invoke the DBCSTAB procedure.

  proc dbcstab;

Assign a name to a translate table.

  name=custtab;

Apply pcibm encoding.

  basetype=pcms;

Access data from the TranTab data set.

  data=trantab;

Set the language to Japanese.

  dbcslang=japanese;

Set the catalog descriptor to Modified Japanese Translation table.

  desc='Modified Japanese Trantab';

Set the table’s location.

  catalog=sasuser.dbcs;

Check for invalid DBCS data and then process the program.

  verify;
  run;
Select the translate table using the TRANTAB= option. Translate tables are used for DBCS conversion with SAS/CONNECT, PROC CPORT and PROC CIMPORT, and the DATA step function KCVT. The TRANTAB= option can specify DBCS translate tables. For SAS 8.2 and earlier, the ninth argument specified the DBCS system table. However, for SAS 9 and later, instead of using the ninth argument, SAS uses a system table that is contained in a module. Japanese, Korean, Chinese, and Taiwanese are acceptable for the SYSTAB name. The 10th argument specifies the DBCS user table:

options trantab=(,,,,,,,,,custtab);

---

Example 2: Producing Japanese Conversion Tables with the DBCSTAB Procedure

Features:

- PROC DBCSTAB statement options:
  - TABLE=
  - DATA=
  - DBLANG=
  - BASETYPE=
  - VERIFY

Program

```sas
data ja_jpn;
  length ibm jis euc pcibm $2.;
  ibm='4040'x;
  jis='2121'x;
  euc='a1a1'x;
  pcibm='8140'x;
run;
proc dbcstab;
  table=japanese;
  data=ja_jpn;
  dblang=japanese;
  basetype=jis;
  verify;
run;
```

Program Description

Define the ja_jpn data set.

```sas
data ja_jpn;
```

Set the length of the specified encodings to 2.

```sas
length ibm jis euc pcibm $2.;
```
Assign the value 4040 to the ibm encoding.
ibm='4040'x;

Assign the value 2121 to the jis encoding.
jis='2121'x;

Assign the value a1a1 to the euc encoding.
euc='a1a1'x;

Assign the value 8140 to the pcibm encoding and run the code.
pcibm='8140'x;
run;

Invoke the DBCSTAB procedure.
proc dbcstab;

Define the table with the name, Japanese.
table=japanese;

Access the Ja_Jpn data set.
data=ja_jpn;

Specify Japanese for the language.
dblang=japanese;

Specify the jis encoding.
basetype=jis;

Check for invalid DBCS data and then process the program.
verify;
run;
Example 2: Producing Japanese Conversion Tables with the DBCSTAB Procedure

SAS Log

```sas
1   proc dbcstab
2       table=ja_jpn
3       data=work.ja_jpn
4       dblang=japanese
5       basetype=jis
6       verify;
7       run;
```

Overview: LOCALEDATA Procedure

What Does the LOCALEDATA Procedure Do?

The LOCALEDATA procedure lets you customize data. You can view, open, modify, and store the customized locale data.

Syntax: LOCALEDATA Procedure

PROC LOCALEDATA;
  LOAD SASLOCALE | REGISTRY;
  MODIFY key=key-name value=key-value | category=category-name value=locale;
  CONTENTS _ALL_ | key-name | category-name;
  SAVE REGISTRY < _ALL_ | key-name | category-name syntax=SAS>;

<table>

### PROC LOCALEDATA Statement

Specifies the source of customized locale data.

**Syntax**

```plaintext
PROC LOCALEDATA;
```

### LOAD Statement

Specifies which source of locale data is loaded for customization.

**Default:** Registry

**Syntax**

```plaintext
LOAD SASLOCALE | REGISTRY;
```

**Required Arguments**

- **SASLOCALE**
  - loads the locale data from the factory setting default locale database.

- **REGISTRY**
  - loads the locale data from the SAS registry. This locale data could be customized locale data that has been stored in the SAS registry.

### MODIFY Statement

Customizes the locale data by locale element key or by locale category.
Syntax

MODIFY key=key-name value=key-value | category=category-name value=locale

Required Arguments

key=key-name value=key-value
customizes single locale element values.

category=category-name value=locale
customizes all locale elements in a category. You can select one of the following categories:
- LC_NUMERIC
- LC_MONETARY
- LC_TIME

The following table shows the element keys that you can modify.

The value of the locale element key must be less than the maximum length value.

The following values can be used for the type:

0  string
1  unassigned integer; use double quotation marks

</tbody>
</table>
CONTENTS Statement
Displays the value of the specified locale element key.

Syntax

\[
\text{CONTENTS}_\text{ALL_} | \text{locale-element-key} | \text{category-name}
\]

Required Arguments

- \text{_ALL_}
doors the value of all locale element keys.

- \text{locale-element-key}
doors the value of the specified locale element key.

- \text{category-name}
doors the value of locale elements for the specified category.

SAVE Statement
Stores the customized locale data in the SAS registry.

Syntax

\[
\text{SAVE \text{REGISTRY}} < \text{_ALL_} | \text{key-name} | \text{category-name syntax=SAS}>
\]

Required Argument

- \text{REGISTRY}
stores locale data in the Sasuser library and registers it in the SAS registry. The encoding of the stored locale data is in UNICODE escape. Here is the hierarchy of the saved locale element in the SAS registry: \text{SAS\_REGISTRY} ⇒ \text{LOCALE} ⇒ \text{sas locale} ⇒ \text{locale element key locale category} ⇒ \text{locale element key}.

Optional Arguments

- \text{_ALL_}
saves all locale data elements.
key-name
saves the specified locale element key name and value.

category-name syntax=SAS
saves all elements in the specified category.

Example: Modifying Locale Data Using the LOCALEDATA Procedure

Example 1: Modifying Locale Data Using the LOCALEDATA Procedure

Features:

- PROC LOCALEDATA statement
- LOAD statement
- MODIFY statement
- SAVE statement
- CONTENTS statement
- DATA step
- PUT statement

The following program modifies locale data. SAS is invoked twice.

Modifying Locale Definitions

```
PROC LOCALEDATA;
LOAD SASLOCALE;
MODIFY KEY=QTR1 VALUE='QTR1';
MODIFY KEY=QTR2 VALUE='QTR2';
MODIFY KEY=QTR3 VALUE='QTR3';
MODIFY KEY=QTR4 VALUE='QTR4';
MODIFY KEY=DATE_SHORT_FORMAT VALUE='%Y/%m/%d';
MODIFY KEY=DATE_YEAR_FORMAT VALUE='Year(%Y)';
SAVE REGISTRY / _ALL_ syntax=SAS;
CONTENTS _ALL_;
QUIT;
data _null_
  a = 19208;
put a nldate. / a nldateyq. / a nldateyr.;
run;
```
Program Description

Invoke the LOCALEDATA procedure.

PROC LOCALEDATA;

Load the locale definitions from the local locale database.

LOAD SASLOCALE;

Modify the definition values.

MODIFY KEY=QTR1 VALUE='QTR1';
MODIFY KEY=QTR2 VALUE='QTR2';
MODIFY KEY=QTR3 VALUE='QTR3';
MODIFY KEY=QTR4 VALUE='QTR4';
MODIFY KEY=DATE_SHORT_FORMAT VALUE='YMD';
MODIFY KEY=DATE_YEAR_FORMAT VALUE='Year(Y)';

Save the modified definitions in the registry. This action overwrites the
definitions that are in the registry so that there are no duplicate key values.

SAVE REGISTRY / _ALL_ syntax=SAS;

View the modified locale definitions from the registry.

CONTENTS _ALL_;

Invoke the QUIT command to end processing.

QUIT;

Create a DATA step for testing the modified locale definitions.

data _null_; 

Assign a value of 19208 to variable a.

a = 19208;

Generate the value of variable a using the formats NLDATE., NLDATEYQ., and NLDATEYR.

put a nldate. / a nldateyq. / a nldateyr.;
run;
PROC LOCALEDATA;

/* Load locale definition from locale DB */
LOAD SASLOCALE;

/* Change the value of the elements */
MODIFY KEY=QTR1 VALUE='QTR1';
MODIFY KEY=QTR2 VALUE='QTR2';
MODIFY KEY=QTR3 VALUE='QTR3';
MODIFY KEY=QTR4 VALUE='QTR4';
MODIFY KEY=DATE_SHORT_FORMAT VALUE='%Y/%m/%d';
MODIFY KEY=DATE_YEAR_FORMAT VALUE='Year(%Y)';

/* Store the locale definition into registry, this will override the existing definition, so there is no duplicate key issue */
SAVE REGISTRY / _ALL_ syntax=SAS;

/* View the locale definition from registry */

  real time 2.96 seconds
  cpu time 0.28 seconds
Overview: TRANTAB Procedure

What Does the TRANTAB Procedure Do?

The TRANTAB procedure creates, edits, and displays customized translation tables. In addition, you can use PROC TRANTAB to view and modify translation tables that are supplied by SAS. These SAS supplied tables are stored in the Sashelp.Host catalog. Any translation table that you create or customize is stored in your Sasuser.Profile catalog. Translation tables have an entry type of TRANTAB.
Translation tables are operating environment-specific SAS catalog entries that translate the values of one (coded) character set to another. A translation table has two halves: table 1 provides a translation, such as ASCII to EBCDIC; table 2 provides the inverse (or reverse) translation, such as EBCDIC to ASCII. Each half of a translation table is an array of 256 two-digit positions, each of which contains a one-byte unsigned number that corresponds to a coded character.

SAS uses translation tables to

- determine the collating sequence in the SORT procedure
- facilitate data communications between the operating environment and a graphics device when you run SAS/GRAPH software in an IBM environment
- accommodate national language character sets other than U.S. English.

PROC TRANTAB produces no output. It can display translation tables and notes in the SAS log.

Note: Translation tables were introduced in SAS 6 to support the requirements of national languages. SAS 8.2 introduced the LOCALE= system option to improve the direct use of translation tables. SAS 9.2 supports the TRANTAB procedure for backward compatibility. However, using the LOCALE= system option is preferred in later SAS releases. PROC TRANTAB is an interactive procedure. Once you submit a PROC TRANTAB statement, you can continue to enter and execute statements without repeating the PROC TRANTAB statement. To terminate the procedure, submit a QUIT statement or another DATA or PROC statement.

Concepts: TRANTAB Procedure

Understanding Translation Tables and Character Sets for 
PROC TRANTAB

The $K$th element in a translation table corresponds to the $K$th element of an ordered character set. For example, position 00 (which is byte 1) in a translation table contains a coded value that corresponds to the first element of the ordered character set. To determine the position of a character in your operating environment's character set, use the RANK function. The following example shows how to use RANK:

```sas
data _null_;
x=rank('a');
put "The position of a is " x ";";
run;
```

The SAS log prints the following message: The position of a is 97.

Each position in a translation table contains a hexadecimal number that is within the range of 0 ('00'x) to 255 ('FF'x). Hexadecimal values always end with an x. You can represent one or more consecutive hexadecimal values within quotation marks followed by a single x. For example, a string of three consecutive hexadecimal
values can be written as '0809A'x. The SAS log displays each row of a translation table as 16 hexadecimal values enclosed in quotation marks followed by an x. The SAS log also lists reference numbers in the vertical and horizontal margins that correspond to the positions in the table. “Example 1: Viewing a Translation Table” on page 791 shows how the SAS log displays a translation table.

Storing Translation Tables with PROC TRANTAB

When you use PROC TRANTAB to create a customized translation table, the procedure automatically stores the table in your Sasuser.Profile catalog. This lets you use customized translation tables without affecting other users. When you specify the translation table in the SORT procedure or in a GOPTIONS statement, the software first looks in your Sasuser.Profile catalog to find the table. If the specified translation table is not in your Sasuser.Profile catalog, the software looks in the Sashelp.Host catalog.

To access your translation table globally, your SAS Installation Representative must copy the table from your Sasuser.Profile catalog (using the CATALOG procedure) to the Sashelp.Host catalog. If the table is not found there, the software continues to search in Sashelp.Locale for it.

Modifying SAS Translation Tables with PROC TRANTAB

If a translation table that is provided by SAS does not meet your needs, you can use PROC TRANTAB to edit it and create a new table. That is, you can issue the PROC TRANTAB statement that specifies the SAS table, edit the table, and then save the table using the SAVE statement. The modified translation table is saved in your Sasuser.Profile catalog. If you are a SAS Installation Representative, you can modify a translation table with PROC TRANTAB and then use the CATALOG procedure to copy the modified table from your Sasuser.Profile catalog to the Sashelp.Host catalog, as shown in the following example:

```sas
proc catalog c=sasuser.profile;
   copy out=sashelp.host entrytype=trantab;
run;
```

You can use PROC TRANTAB to modify translation tables stored in the Sashelp.Host catalog only if you have update (or write) access to that data library and catalog.

Using Translation Tables Outside PROC TRANTAB

Using Translation Tables in the SORT Procedure

PROC SORT uses translation tables to determine the sort’s collating sequence. You can specify an alternative translation table with the SORTSEQ= option of PROC SORT. For example, if your operating environment sorts with the EBCDIC sequence by default, and you want to sort with the ASCII sequence, you can issue the following statement to specify the ASCII translation table:
proc sort sortseq=ascii;
run;

You can also create a customized translation table with PROC TRANTAB and specify the new table with PROC SORT. This table is useful when you want to specify sorting sequences for languages other than U.S. English.

See “Example 6: Using Different Translation Tables for Sorting” on page 801 for an example that uses translation tables to sort data in different ways. For information about the tables available for sorting and the SORTSEQ= option, see “SORTSEQ= System Option: UNIX, Windows, and z/OS” on page 706.

Transcoding External Files

Translation tables are implicitly set by the LOCALE= system option. They are used only for transcoding external files.

You can list the translation tables with the OPTIONS procedure. The following example uses the z/OS environment with a LOCALE= system option set to en_US:

```
TRANTAB=(eol1wlt1,wlt1eol1,elat_ucs,elat_lcs,elat_ccl,,,elat_scc)
```

Using Translation Tables in SAS/GRAPH Software

In SAS/GRAPH software, translation tables are most commonly used in an IBM operating environment, where tables are necessary because graphics commands must leave IBM operating environments in EBCDIC representation but must reach asynchronous graphics devices in ASCII representation. Specifically, SAS/GRAPH software builds the command stream for these devices internally in ASCII representation. However, it must convert the commands to EBCDIC representation before they can be given to the communications software for transmission to the device. SAS/GRAPH software uses a translation table internally to make the initial conversion from ASCII to EBCDIC. The communications software then translates the command stream back to ASCII representation before it reaches the graphics device.

Translation tables are operating environment-specific. In most cases, you can simply use the default translation table, SASGTAB0, or one of the SAS supplied graphics translation tables. However, if these tables cannot perform all of the translation correctly, you can create your own translation table with PROC TRANTAB. The SASGTAB0 table might fail to do the translation correctly when it encounters characters from languages other than U.S. English.

To specify an alternative translation table for SAS/GRAPH software, you can either use the TRANTAB= option in a GOPTIONS statement or modify the TRANTAB device parameter in the device entry. For example, the following GOPTIONS statement specifies the GTABTCAM graphics translation table:

```
goptions trantab=gtabtcam;
```

Translation tables used in SAS/GRAPH software perform both device-to-operating environment translation and operating environment-to-device translation. Therefore, a translation table consists of 512 bytes, with the first 256 bytes used to perform device-to-operating environment translation (ASCII to EBCDIC on IBM mainframes) and the second 256 bytes used to perform operating environment-to-device translation (EBCDIC to ASCII on IBM mainframes). For PROC TRANTAB, the area of a translation table for device-to-operating environment translation is considered to
be table 1, and the area for operating environment-to-device translation is considered to be table 2. See “Example 1: Viewing a Translation Table” on page 791 for a listing of the ASCII translation table (a SAS provided translation table), which shows both areas of the table.

For operating environments other than IBM mainframes, translation tables can be used to translate specific characters in the data stream that are created by the driver. For example, if the driver normally generates a vertical bar in the data stream, but you want another character to be generated in place of the vertical bar, you can create a translation table that translates the vertical bar to an alternate character.

SAS/GRAPH software also uses key maps and device maps to map codes generated by the keyboard to specified characters and to map character codes to codes required by the graphics output device. These maps are specific to SAS/GRAPH software. For more information, contact SAS Technical Support.

Syntax: TRANTAB Procedure

Tip: Supports RUN group processing

PROC TRANTAB TABLE=table-name <NLS>;
CLEAR <ONE | TWO | BOTH>;
INVERSE;
LIST <ONE | TWO | BOTH>;
LOAD TABLE=table-name <NLS>;
REPLACE position value-1 < …value-n>;
SAVE <TABLE=table-name> <CAT=libname.catalog > <ONE | TWO | BOTH>;
SWAP;

PROC TRANTAB Statement

Creates, edits, or displays a translation table.

Tip: If there is an incorrect table name in the PROC TRANTAB statement, use the LOAD statement to load the correct table. You do not need to reinvoke PROC TRANTAB. New tables are not stored in the catalog until you issue the SAVE statement, so you do not have unwanted tables in your catalog.

Syntax

PROC TRANTAB TABLE=table-name <NLS>;

Required Argument

TABLE=table-name
specifies the translation table to create, edit, or display the table. The specified table name must be a valid one-level SAS name with no more than eight characters.

Optional Argument

NLS
specifies that the table listed in the TABLE= argument is one of five special internal translation tables provided with SAS. You must use the NLS option when you specify one of the five special tables in the TABLE= argument. NLS stands for National Language Support. This option and the associated translation tables provide a method to translate characters that exist in languages other than U.S. English. To use the modified NLS table, specify its name in the SAS system option TRANTAB= . When you load one of these special translation tables, the SAS log displays a note stating that table 2 is uninitialized. That is, table 2 is an empty table that contains all 0s. PROC TRANTAB does not use table 2 for translation in these special cases.

SASXPT
specifies the local-to-transport format translation table (used by the CPORT procedure).

SASLCL
specifies the transport-to-local format translation table (used by the CIMPORT procedure).

SASUCS
specifies the lowercase-to-uppercase translation table (used by the UPCASE function).

SASLCS
specifies the uppercase-to-lowercase translation table (used by the LOWCASE macro).

SASCCL
specifies the character classification table (used internally), which contains flag bytes that correspond to each character position. These positions indicate the class or classes to which each character belongs.
CLEAR Statement
Sets all positions in the translation table to 0; used when you create a new table.

Syntax
CLEAR <ONE | TWO | BOTH>;

Optional Argument
ONE | TWO | BOTH
ONE
clears table 1.
TWO
clears table 2.
BOTH
clears both table 1 and table 2.

Default  ONE

INVERSE Statement
Creates an inverse of table 1 in a translation table. The INVERSE statement creates table 2.

Syntax
INVERSE;

Details
The INVERSE statement does not preserve multiple translations. Suppose table 1 has 2 (or more) different characters translated to the same value; for example, "A" and "B" are both translated to "1". For table 2, the INVERSE statement uses the last translated character for the value. "1" is always translated to "B" and not "A", assuming that "A" appears before "B" in the first table. Sort programs in SAS require an inverse table for proper operation.

LIST Statement
Displays a translation table in hexadecimal representation in the SAS log.
Syntax

LIST <ONE | TWO | BOTH>;

Optional Argument

ONE | TWO | BOTH

ONE
displays table 1.

TWO
displays table 2.

BOTH
displays both table 1 and table 2.

Default ONE

LOAD Statement

Loads a translation table into memory for editing.

Tips:

Use the LOAD statement when you specify an incorrect table name in the PROC TRANTAB statement. You can specify the correct name without reinvoking the procedure.

Use the LOAD statement to edit multiple translation tables in a single PROC TRANTAB step. (Be sure to save the first table before you load another one.)

Syntax

LOAD TABLE=table-name <NLS>;

Required Argument

TABLE=table-name

specifies the name of an existing translation table to edit. The specified table name must be a valid one-level SAS name.

Optional Argument

NLS

specifies that the table listed in the TABLE= argument is one of five special internal translation tables that are provided with SAS. You must use the NLS option when you specify one of the five special tables in the TABLE= argument:

SASXPT

specifies the local-to-transport format translation table.

SASLCL

specifies the transport-to-local format translation table.

SASUCS

specifies the lowercase-to-uppercase translation table.
SASLCS
specifies the uppercase-to-lowercase translation table.

SASCCL
specifies the character classification table, which contains flag bytes that correspond to each character position. These positions indicate the class or classes to which each character belongs.

NLS stands for National Language Support. This option and the associated translation tables provide a method to map characters from languages other than English to programs, displays, and files. When you load one of these special translation tables, the SAS log displays a note that states that table 2 is uninitialized. That is, table 2 is an empty table that contains all 0s. PROC TRANTAB does not use table 2 for translation in these special cases.

REPLACE Statement
Replaces characters in a translation table with the specified values, starting at the specified position.

Alias: REP
Tip: To save edits, you must issue the SAVE statement.

Syntax
REPLACE position value-1 < ...value-n>;

Required Arguments

position
specifies the position in a translation table where the replacement begins. The editable positions in a translation table begin at decimal 0 and end at decimal 255. To specify the position, you can do either of the following:

- Use a decimal or hexadecimal value to specify an actual location. If you specify a decimal value (for example, 20), PROC TRANTAB locates position 20 in the table, which is byte 21. If you specify a hexadecimal value (for example, ‘14’x), PROC TRANTAB locates the decimal position that is equivalent to the specified hexadecimal value, which in this case is position 20 (or byte 21) in the table.

- Use a quoted character. PROC TRANTAB locates the quoted character in the table (that is, the quoted character's hexadecimal value) and uses that character's position as the starting position. For example, specifying the following REPLACE statement replaces the first occurrence of the hexadecimal value for "a" and the next two hexadecimal values with the hexadecimal equivalent of "ABC":

  replace 'a' 'ABC';

This action is useful when you want to locate alphabetic and numeric characters, but you do not know their actual location. If the quoted character is not found, PROC TRANTAB displays an error message and ignores the statement.

To edit positions 256 through 511 (table 2), follow these steps:

1. Issue the SWAP statement.
2  Issue the appropriate REPLACE statement.

3  Issue the SWAP statement again to reposition the table.

\[value-1 \ldots value-n\]

is one or more decimal, hexadecimal, or character constants that specify the actual value to place in the table, starting at position. You can also use a mixture of these values. That is, you can specify a decimal, a hexadecimal, and a character value in one REPLACE statement. “Example 3: Editing By Specifying a Decimal Value for the Starting Position” on page 795 shows a mixture of all three types of values in the REPLACE statement.

SAVE Statement

Saves the translation table in your Sasuser.Profile catalog.

Syntax

SAVE <TABLE=table-name> <CAT=libname.catalog> <ONE | TWO | BOTH>;

Optional Arguments

TABLE=table-name

specifies the name under which the current table is saved. The name must be a valid one-level SAS name.

Default  If you omit the TABLE= option, the current table is saved under the name you specify in the PROC TRANTAB statement or in the LOAD statement.

CAT=libname.catalog

specifies the name of the output catalog when you are saving a TRANTAB entry.

ONE | TWO | BOTH

ONE

saves table 1.

TWO

saves table 2.

BOTH

saves both table 1 and table 2.

Default  BOTH

SWAP Statement

Exchanges table 1 with table 2 to enable you to edit positions 256 through 511.
Example 1: Viewing a Translation Table

Features: LIST statement

This example uses PROC TRANTAB to display the ASCII translation table supplied by SAS. All examples were produced in the Linux environment.

Set the options and specify a translation table.

```
options nodate pageno=1 linesize=80 pagesize=60;
proc trantab table=ascii;
```

Display both halves of the translation table. The LIST BOTH statement displays both the table that provides the translation and the table that provides the inverse translation.

```
list both;
```
Example 2: Creating a Translation Table

Features:

Procedures features:
- LIST statement
- REPLACE statement
- SAVE statement

This example uses PROC TRANTAB to create a customized translation table. All examples were produced in the Linux environment.

Set the system options and specify the translation table to edit.

options nodate pageno=1 linesize=80 pagesize=60;
Replace characters in the translation table starting at a specified position. The REPLACE statement places the values in the table starting at position 0. You can use hexadecimal values of any length in the REPLACE statement. This example uses strings of length 16 to match how translation tables appear in the SAS log.

```
replace 0
'00010203a309e57ff9ecc40b0c0d0e0f'x
'10111213a5e008e71819c6c51c1d1e1f'x
'c7fce9e2e40a171beaeb8fefe050607'x

'30313233343536373839b75f6eb25f5f'x
```

Save the table. The SAVE statement saves the table under the name that is specified in the PROC TRANTAB statement. By default, the table is saved in your Sasuser.Profile catalog.

```
save;
```

Display both halves of the translation table in the SAS log. The LIST BOTH statement displays both the table that provides the translation and the table that provides the inverse translation.

```
list both;
```
-->Create
and edit table 2. Table 2 is empty; that is, it consists entirely of 0s. To create table 2, you can use the INVERSE statement.
(See: SAS(R) Statements: Reference)

To edit table 2, you can use the SWAP statement with the REPLACE statement.
(See: SAS(R) Statements: Reference)

Example 3: Editing By Specifying a Decimal Value for the Starting Position

Features:

- LIST statement
- REPLACE statement
- SAVE statement

This example edits the translation table that was created in "Example 2: Creating a Translation Table" on page 792. The decimal value specified in the REPLACE statement marks the starting position for the table changes.

The vertical arrow in both SAS logs marks the point at which the changes begin.

All examples were produced in the Linux environment.

Program 1: Display the Original Table

```sas
options nodate pageno=1 linesize=80 pagesize=60; proc trantab table=newtable;
list one;
```

Program Description

Set the system options and specify the translation table to edit.

```sas
options nodate pageno=1 linesize=80 pagesize=60; proc trantab table=newtable;
```

Display the original table. This LIST statement displays the original NEWTABLE translation table.

```sas
list one;
```

SAS Log

Original NEWTABLE Translation Table
Program 2: Edit the Table

```
replace 10
  20 10 200 'x' 'ux' '092040'x;
```

save;
list one;

Program Description

Replace characters in the translation table, starting at a specified position. The REPLACE statement starts at position decimal 10, which is byte 11 in the original table, and performs a byte-to-byte replacement with the given values.

```
replace 10
  20 10 200 'x' 'ux' '092040'x;
```

Save the changes. The SAVE statement saves the changes that you made to the NEWTABLE translation table.

```
save;
```

Display the new table. The second LIST statement displays the edited NEWTABLE translation table.

```
list one;
```
SAS Log

Saving table NEWTABLE.
NOTE: NEWTABLE table 2 will not be saved because it is uninitialized.
NEWTABLE table 1:

Output Details
At position 10 (which is byte 11), a vertical arrow denotes the starting point for the changes to the translation table.
At byte 11, decimal 20 (which is hexadecimal 14) replaces hexadecimal C4.
At byte 12, decimal 10 (which is hexadecimal 0A) replaces hexadecimal 0B.
At byte 13, decimal 200 (which is hexadecimal C8) replaces hexadecimal 0C.
At byte 14, character 'x' (which is hexadecimal 78) replaces hexadecimal 0D.
At bytes 15 and 16, characters 'ux' (which are hexadecimal 75 and 78, respectively) replace hexadecimal 0E and 0F.
At bytes 17, 18, and 19, hexadecimal 092040 replaces hexadecimal 101112.

Example 4: Editing By Using a Quoted Character for the Starting Position

Features:
LIST statement
LOAD statement
REPLACE statement
SAVE statement

This example creates a new translation table by editing the ASCII translation table. The first occurrence of the hexadecimal equivalent of the quoted character that was specified in the REPLACE statement is the starting position for the changes to the table. This method differs from "Example 3: Editing By Specifying a Decimal Value for the Starting Position" on page 795 because you do not need to know the exact
position at which to start the changes to the table. PROC TRANTAB finds the
correct position for you.

The edited table is saved under a new name. Horizontal arrows in both SAS logs
denote the edited rows in the translation table.

All examples were produced in the Linux environment.

**Program 1: Display the Original Table**

```sas
options nodate pageno=1 linesize=80 pagesize=60;
proc trantab table=ascii;
list one;
```

**Program Description**

Set the system options and specify which translation table to edit.

```sas
options nodate pageno=1 linesize=80 pagesize=60;
proc trantab table=ascii;
```

Display the translation table. The LIST statement displays the original
translation table in the SAS log.

```sas
list one;
```

**SAS Log**

```
NOTE: Table specified is ASCII.

```

**Program 2: Edit the Table**

```sas
replace 'a' 'ABCDEFGHIJKLMNOPQRSTUVWXYZ';
save table=upper;
load table=upper;
list one;
```
Program Description

Replace characters in the translation table, starting at a specified position. The REPLACE statement finds the first occurrence of the hexadecimal "a" (which is 61) and replaces it and the next 25 hexadecimal values with the hexadecimal values for uppercase "A" through "Z."

```plaintext
replace 'a' 'ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

Save your changes. The SAVE statement saves the changes made to the ASCII translation table under the new table name UPPER. The stored contents of the ASCII translation table remain unchanged.

```plaintext
save table=upper;
```

Load and display the translation table. The LOAD statement loads the edited translation table UPPER. The LIST statement displays the translation table UPPER in the SAS log.

```plaintext
load table=upper;
list one;
```

SAS Log

NOTE: Table UPPER being loaded.
UPPER table 1:
0 1 2 3 4 5 6 7 8 9 A B C D E F

Example 5: Creating the Inverse of a Table

Features:
- INVERSE statement
- LIST statement
- SAVE statement

This example creates the inverse of the translation table that was created in “Example 4: Editing By Using a Quoted Character for the Starting Position” on page 797. The new translation table that is created in this example is the operating environment-to-device translation for use in data communications.

```plaintext
options nodate pageno=1 linesize=80 pagesize=60;
```
proc trantab table=upper;

Create the inverse translation table, save the tables, and then display them. The INVERSE statement creates table 2 by inverting the original table 1 (called UPPER). The SAVE statement saves the translation tables. The LIST BOTH statement displays both the original translation table and its inverse.

inverse;
    save;
    list both;

SAS Log

The INVERSE statement lists in the SAS log all of the multiple translations that it encounters as it inverts the translation table. In "Example 4: Editing By Using a Quoted Character for the Starting Position" on page 797, all the lowercase letters are converted to uppercase in the translation table UPPER, which means that there are two sets of uppercase letters in UPPER. When INVERSE cannot make a translation, PROC TRANTAB fills the value with 00. Note that the inverse of the translation table UPPER has numerous 00 values.

The SAS log lists all the duplicate values that it encounters as it creates the inverse of table 1. To conserve space, most of these messages are deleted in this example.
Example 6: Using Different Translation Tables for Sorting

Features:

- PROC SORT statement option: SORTSEQ=
- PRINT procedure

This example shows how to specify a different translation table to sort data in an order that is different from the default sort order. Characters that are written in a language other than U.S. English might require a sort order that is different from the default order.
You can use the TRABASE program in the SAS Sample Library to create translation tables for several languages. All examples were produced in the Linux environment.

**Set the SAS system options.**

```plaintext
options nodate pageno=1 linesize=80 pagesize=60;
```

**Create the TESTSORT data set.** The DATA step creates a SAS data set with four pairs of words, each pair different only in the case of the first letter.

```plaintext
data testsort;
  input Values $10.;
datalines;
Always
always
Forever
forever
Later
later
Yesterday
yesterday
;
```

**Sort the data in an order that is different from the default sort order.** PROC SORT sorts the data by using the default translation table, which sorts all lowercase words first, then all uppercase words.

```plaintext
proc sort;
  by values;
run;
```

**Print the data set.** PROC PRINT prints the sorted data set.

```plaintext
proc print noobs;
  title 'Default Sort Sequence';
run;
```

**SAS Output**

The following output is the output from sorting values with the default translation table. The default sort sequence sorts all the capitalized words in alphabetical order before it sorts any lowercase words.

```
Default Sort Sequence
1

  Values
  Always
  Forever
  Later
  Yesterday
  always
  forever
  later
  yesterday
```

**Sort the data according to the translation table UPPER and print the new data set.** The SORTSEQ= system option specifies that PROC SORT sort the data according to the customized translation table UPPER, which treats lowercase
and uppercase letters alike. This method is useful for sorting without regard for case. PROC PRINT prints the sorted data set.

```
proc sort sortseq=upper;
    by values;
run;
proc print noobs;
    title 'Customized Sort Sequence';
run;
```

SAS Output
The following output is the result from sorting values with a customized translation table. The customized sort sequence sorts all the words in alphabetical order, without regard for the case of the first letters.

```
<table>
<thead>
<tr>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
</tr>
<tr>
<td>always</td>
</tr>
<tr>
<td>Forever</td>
</tr>
<tr>
<td>forever</td>
</tr>
<tr>
<td>Later</td>
</tr>
<tr>
<td>later</td>
</tr>
<tr>
<td>Yesterday</td>
</tr>
<tr>
<td>yesterday</td>
</tr>
</tbody>
</table>
```

Example 7: Editing Table 1 and Table 2
Features:
- LIST statement
- REPLACE statement
- SAVE statement
- SWAP statement

This example shows how to edit both areas of a translation table. To edit positions 256 through 511 (table 2), you must

- Issue the SWAP statement to have table 2 change places with table 1.
- Issue an appropriate REPLACE statement to make changes to table 2.
- Issue the SWAP statement again to reposition the table.

Arrows in the SAS logs mark the rows and columns that are changed.

Set the SAS system options and specify the translation table.

```
options nodate pageno=1 linesize=80 pagesize=60;
proc trantab table=upper;
```

Display the original translation table. The LIST statement displays the original UPPER translation table.

```
list both;
```
Replace characters in the translation table starting at a specified position. The REPLACE statement starts at position 1 and replaces the current value of 01 with '0A'.

```
replace 1 '0A'x;
```

Prepare table 2 for editing. The first SWAP statement positions table 2 so that it can be edited. The second REPLACE statement makes the same change in table 2 that was made in table 1.

```
swap;
replace 1 '0A'x;
```

Save and display the tables in their original positions. The second SWAP statement restores table 1 and table 2 to their original positions. The SAVE statement saves both areas of the translation table by default. The LIST statement displays both areas of the table.
Example 7: Editing Table 1 and Table 2

### SAS Log

The upper table 1 is modified. The hexadecimal value '0A' replaces hexadecimal value 01 in byte 2 for both areas of the translation table. Arrows mark the rows and columns of the table in which this change is made.

#### NOTE: Table specified is UPPER.

**UPPER table 1:**

<table>
<thead>
<tr>
<th>0 1 2 3 4 5 6 7 8 9 A B C D E F</th>
</tr>
</thead>
<tbody>
<tr>
<td>00 '000A02030405060708090A0B0C0D0E0F'x</td>

### Locale-to-Encoding Mapping

This table lists the valid POSIX values, and maps the locale to the default encoding used on various hosts. The settings for DFLANG, DATESTYLE, and PAPERSIZE system options are set automatically.

Here is an example:

```
sas -locale arabic_algeria
```

When the Arabic_Algeria LOCALE= value is specified, corresponding default settings for the system options are as follows:

- DFLANG=English
- DATESTYLE=DMY
- PAPERSIZE=A4

### Table 21.2  Default Values for DFLANG, DATESTYLE, and PAPERSIZE System Options Based on the LOCALE= System Option

Overview to System Options Used in a SAS Session for DBCS

You can use the DBCSLANG= and DBCSTYPE= system options to specify the DBCS encoding values for a SAS session. However, the ENCODING= system option is the recommended method in setting a SAS session for DBCS. The ENCODING= system option has priority. For more information, see “Setting the Encoding of a SAS Session” on page 21. Please see the “ENCODING System Option: UNIX, Windows, and z/OS” on page 692 for more information.

DBCS Values for a SAS Session

The following table shows the supported values for the DBCSLANG= and DBCSTYPE= system options under the z/OS, UNIX, and Windows operating environments.

Note: If an encoding value contains a hyphen (-), enclose the encoding value in quotation marks.

Table 22.1  DBCS Supported Values for the DBCSLANG= and DBCSTYPE= System Options

Overview to SAS Language Elements That Use Encoding Values

When the encoding of the SAS session is different from the encoding of the SAS file or from the data that resides in the SAS file, transcoding must occur. Consider a SAS file that was created in the Western Latin1 encoding, then moved to an IBM mainframe that uses the German EBCDIC encoding. In order for the IBM mainframe to successfully access the file, the SAS data file must be transcoded from the Western Latin1 encoding to the German EBCDIC encoding. For information about transcoding concepts, including SAS language elements that contain options for transcoding, see Chapter 4, “Transcoding for NLS,” on page 31.

SBCS, DBCS, and Unicode Encoding Values for Transcoding Data

The following table presents a list of SBCS, DBCS, and Unicode encoding values for transcoding data for all operating environments. The encoding values are valid for SAS language elements that contain options for transcoding.

Note: If an encoding value contains a hyphen (-), enclose the encoding value in quotation marks.

Additional NLS Language Elements

The following EUR language elements have been replaced with NL language elements. The EUR elements are supported in SAS 9.3, but SAS recommends that you use the NL elements.

Dictionary

EURDFDDw. Format

Writes international date values in the form *dd.mm.yy* or *dd.mm.yyyy*.

**Category:** Date and Time

**Alignment:** Right

**Syntax**

```
EURDFDDw.
```

**Syntax Description**

`\( w \)` specifies the width of the output field.
EURDFDDw. Format

<table>
<thead>
<tr>
<th>Default</th>
<th>8 (except Finnish, which is 10)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>2–10</td>
</tr>
<tr>
<td>Tip</td>
<td>When w is from 2 to 5, SAS prints as much of the month and day as possible. When w is 7, the date appears as a two-digit year without slashes, and the value is right-aligned in the output field.</td>
</tr>
</tbody>
</table>

Details

The EURDFDDw. format writes SAS date values in the form \textit{dd.mm.yy} or \textit{dd.mm.yyyy}, where

- \textit{dd} is the two-digit integer that represents the day of the month.
- \textit{mm} is the two-digit integer that represents the month.
- \textit{yy} or \textit{yyyy} is a two-digit or four-digit integer that represents the year.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= system option.

Example

The example table uses the input value 15342, which is the SAS date value that corresponds to January 2, 2002. The first PUT statement assumes that the DFLANG= system option is set to Spanish.

```sas
options dflang=spanish;

data _null_
  input day;
  put day eurdfdd8.;
datalines;
15342
;
```

<table>
<thead>
<tr>
<th>Statement</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>put date eurdfdd8.;</td>
<td>02.01.02</td>
</tr>
</tbody>
</table>

---
EURDFDEw. Format

Writes international date values in the form *ddmmmyy* or *ddmmmyyyy*.

**Syntax**

EURDFDEw.

**Syntax Description**

**w**

specifies the width of the output field.

**Default**

7 (except Finnish)

**Range**

5–9 (except Finnish)

**Note**

If you use the Finnish (FIN) language prefix, the w range is 9–10 and the default is 9.

**Details**

The EURDFDEw. format writes SAS date values in the form *ddmmmyy* or *ddmmmyyyy*:

**dd**

is an integer that represents the day of the month.

**mmm**

is the first three letters of the month name.

**yy or yyyy**

is a two-digit or four-digit integer that represents the year.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.
Note: The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set, such as UTF-8.

Example

The example table uses the input value 15342, which is the SAS date value that corresponds to January 2, 2002. The first PUT statement assumes that the DFLANG= system option is set to Spanish.

```sas
options dflang=spanish;

data _null_;  
  input day;  
  put day eurdfde9.;  
  put day espdfde9.;  
  put day fradjde9.;  
  datalines;  
  15342  
;  
```

---

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put date eurdfde9.;</td>
<td>02ene2002</td>
</tr>
<tr>
<td>put date espdfde9.;</td>
<td>02ene2002</td>
</tr>
<tr>
<td>put date fradjde9.;</td>
<td>02jan2002</td>
</tr>
</tbody>
</table>

EURDFDNw. Format

Writes international date values as the day of the week.

Category: Date and Time

Alignment: Right
Syntax

EURDFDNw.

Syntax Description

w
 specifies the width of the output field.

Default  1
Range     1–32

Details

The EURDFDNw. format writes SAS date values in the form day-of-the-week:

day-of-the-week
 is represented as 1=Monday, 2=Tuesday, and so on.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

Note: The EUR-date formats require European character sets and encodings. Some formats work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

Example

The example table uses the input value 15342, which is the SAS date value that corresponds to January 2, 2002. The first PUT statement assumes that the DFLANG= system option is set to Spanish.

options dflang=spanish;

data _null_;  
  input day;  
  put day eurdfdn.;  
  put day espdfdn.;  
  put day itadfdn.;  
datalines;  
15342
;

The second PUT statement uses the Spanish language prefix in the format to write the day of the week in Spanish. The third PUT statement uses the Italian language prefix in the format to write the day of the week in Italian. Therefore, the value of the DFLANG= option is ignored.

options dflang=spanish;

## EURDFD Tw.d Format

Writes international datetime values in the form `ddmmmyy:hh:mm:ss.ss` or `ddmmmyyyy hh:mm:ss.ss`.

**Category:** Date and Time  
**Alignment:** Right

### Syntax

**EURDFDTw.d**

### Syntax Description

**w**  
specifies the width of the output field.  
- **Default:** 16  
- **Range:** 7–40  
- **Tip:** If you want to write a SAS datetime value with the date, hour, and seconds, the width (`w`) must be at least 16. Add an additional two places to the width if you want to return values with optional decimal fractions of seconds.

**d**  
specifies the number of digits to the right of the decimal point in the numeric value.  
- **Range:** 1–39  
- **Restrictions:** must be less than `w`  
  - If `w – d < 17`, SAS truncates the decimal values.

### Details

The EURDFDTw.d format writes SAS datetime values in the form `ddmmmyy:hh:mm:ss.ss:`
*dd*  
is an integer that represents the day of the month.

*mmm*  
is the first three letters of the month name.

*yy or yyyy*  
is a two-digit or four-digit integer that represents the year.

*hh*  
is the number of hours that range from 00 through 23.

*mm*  
is the number of minutes that range from 00 through 59.

*ss.ss*  
is the number of seconds that range from 00 through 59 with the fraction of a second following the decimal point.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

**Note:** The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

**Example**

The example table uses the input value of 1347453583, which is the SAS datetime value that corresponds to September 12, 2002, at 12:39:43 p.m. The first PUT statement assumes that the DFLANG= system option is set to German.

```sas
options dflang=german;

data _null_;  
input date;  
put date= ;  
put date eurdfdt20.;  
put date deudfdt20.;  
put date itadfdt20.;  
datalines;  
1347453583;
;
run;
```

The second PUT statement uses the German language prefix in the format to write the international datetime value in German. The third PUT statement uses the Italian language prefix in the format to write the international datetime value in Italian. The value of the DFLANG= option, therefore, is ignored.

```sas
options dflang=german;
data _null_;  
input date;  
put date= ;  
put date eurdfdt20.;  
put date deudfdt20.;  
put date itadfdt20.;  
datalines;  
1347453583;
;
run;
```
EURDFDWNw. Format

Writes international date values as the name of the day.

Category: Date and Time
Alignment: Right

Syntax
EURDFDWNw.

Syntax Description

w

specifies the width of the output field.

The default depends on the language prefix that you use. The following table shows the default value for each language:

<table>
<thead>
<tr>
<th>Language</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Afrikaans (AFR)</td>
<td>9</td>
</tr>
<tr>
<td>Catalan (CAT)</td>
<td>9</td>
</tr>
<tr>
<td>Croatian (CRO)</td>
<td>10</td>
</tr>
<tr>
<td>Czech (CSY)</td>
<td>7</td>
</tr>
<tr>
<td>Danish (DAN)</td>
<td>7</td>
</tr>
<tr>
<td>Dutch (NLD)</td>
<td>9</td>
</tr>
<tr>
<td>Finnish (FIN)</td>
<td>11</td>
</tr>
<tr>
<td>French (FRA)</td>
<td>8</td>
</tr>
</tbody>
</table>
### Language

<table>
<thead>
<tr>
<th>Language</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>German (DEU)</td>
<td>10</td>
</tr>
<tr>
<td>Hungarian (HUN)</td>
<td>9</td>
</tr>
<tr>
<td>Italian (ITA)</td>
<td>9</td>
</tr>
<tr>
<td>Macedonian (MAC)</td>
<td>10</td>
</tr>
<tr>
<td>Norwegian (NOR)</td>
<td>7</td>
</tr>
<tr>
<td>Polish (POL)</td>
<td>12</td>
</tr>
<tr>
<td>Portuguese (PTG)</td>
<td>13</td>
</tr>
<tr>
<td>Russian (RUS)</td>
<td>11</td>
</tr>
<tr>
<td>Slovenian (SLO)</td>
<td>10</td>
</tr>
<tr>
<td>Spanish (ESP)</td>
<td>9</td>
</tr>
<tr>
<td>Swedish (SVE)</td>
<td>7</td>
</tr>
<tr>
<td>Swiss-French (FRS)</td>
<td>8</td>
</tr>
<tr>
<td>Swiss-German (DES)</td>
<td>10</td>
</tr>
</tbody>
</table>

**Default**: depends on the language prefix you use.

**Range**: 1–32

**Tip**: If you omit `w`, SAS prints the entire name of the day.

### Details

If necessary, SAS truncates the name of the day to fit the format width. The EURDFDWNw. format writes SAS date values in the form `day-name`:

- `day-name` is the name of the day.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.
Note: The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

Example

The following example table uses the input value 15344, which is the SAS date value that corresponds to January 4, 2002. The first PUT statement assumes that the DFLANG= system option is set to French.

```sas
options dflang=french;
put day eurdfdwn8.;
```

The second PUT statement uses the French language prefix in the format to write the day of the week in French. The third PUT statement uses the Spanish language prefix in the format to write the day of the week in Spanish. Therefore, the value of the DFLANG= option is ignored.

```sas
options dflang=french;
data _null_;    
input day;    
put day eurdfdwn8.;    
put day fradfdwn8.;    
put day espdfdwn8.;    
datalines;    
15344        
;    
run;
```

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put day eurdfdwn8.;</td>
<td>Vendredi</td>
</tr>
<tr>
<td>put day fradfdwn8.;</td>
<td>Vendredi</td>
</tr>
<tr>
<td>put day espdfdwn8.;</td>
<td>viernes</td>
</tr>
</tbody>
</table>

**EURDFMnw. Format**

Writes international date values as the name of the month.

Category: Date and Time

Alignment: Right
Syntax

EURDFMNw.

Syntax Description

w specifies the width of the output field.

<table>
<thead>
<tr>
<th>Default</th>
<th>9 (except for Finnish and Spanish)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>1–32</td>
</tr>
</tbody>
</table>

Note: If you use the Finnish (FIN) language prefix, the default value for w is 11. If you use the Spanish (ESP) language prefix, the default value for w is 10.

Details

If necessary, SAS truncates the name of the month to fit the format width. The EURDFMNw. format writes SAS date values in the form month-name:

month-name

is the name of the month.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

Note: The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

Example

The example table uses the input value 15344, which is the SAS date value that corresponds to January 4, 2002. The first PUT statement assumes that the DFLANG= system option is set to Italian.

```sas
options dflang=ita;

data _null_;
  input day;
  put day eurdfmn10.;
```

The second PUT statement uses the Italian language prefix in the format to write the name of the month in Italian. The third PUT statement uses German language prefix in the format to write the name of the month in German. Therefore, the value of the DFLANG= option is ignored.

```sas
options dflang=ita;
data _null_;input day;put day eurdfm10.;
```
put day itadfmn10.;
put day deudfmn10.;
datalines;
15344
;
run;

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put date eurdfmn10.;</td>
<td>janvier</td>
</tr>
<tr>
<td>put date itadfmn10.;</td>
<td>Gennaio</td>
</tr>
<tr>
<td>put date deudfmn10.;</td>
<td>Januar</td>
</tr>
</tbody>
</table>

**EURDFMYw. Format**

Writes international date values in the form *mmmyy* or *mmmyyyy*.

**Syntax**

**EURDFMYw.**

**Syntax Description**

`w`

specifies the width of the output field.

- **Default**: 5 (except for Finnish)
- **Range**: 5–7
- **Note**: If you use the Finnish (FIN) language prefix, the value for *w* must be 8, which is the default value.

**Details**

The EURDFMYw. format writes SAS date values in the form *mmmyy*, where

*mmmm*

is the first three letters of the month name.

*yy or yyyy*

is a two-digit or four-digit integer that represents the year.
You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

Note: The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

Example

The example table uses the input value 15342, which is the SAS date value that corresponds to January 2, 2002. The first PUT statement assumes that the DFLANG= system option is set to Spanish.

```sas
options dflang=spanish;

data _null_
input date;
put date eurdfmy7.;
put date espdfmy7.;
put date fradfmy7.;
datalines;
15342
;
```

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put date eurdfmy7.;</td>
<td>ene2002</td>
</tr>
<tr>
<td>put date espdfmy7.;</td>
<td>ene2002</td>
</tr>
<tr>
<td>put date fradfmy7.;</td>
<td>jan2002</td>
</tr>
</tbody>
</table>
EURDFWDXw. Format

Writes international date values as the name of the month, the day, and the year in the form \textit{dd month-name yy} (or \textit{yyyy}).

Category: Date and Time
Alignment: Right

Syntax

\texttt{EURDFWDXw}.

Syntax Description

\texttt{w}

specifies the width of the output field.

The default depends on the language prefix that you use. The following table shows the default value for each language:

<table>
<thead>
<tr>
<th>Language</th>
<th>Maximum</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Afrikaans (AFR)</td>
<td>37</td>
<td>29</td>
</tr>
<tr>
<td>Catalan (CAT)</td>
<td>40</td>
<td>16</td>
</tr>
<tr>
<td>Croatian (CRO)</td>
<td>40</td>
<td>16</td>
</tr>
<tr>
<td>Czech (CSY)</td>
<td>40</td>
<td>16</td>
</tr>
<tr>
<td>Danish (DAN)</td>
<td>18</td>
<td>18</td>
</tr>
<tr>
<td>Dutch (NLD)</td>
<td>37</td>
<td>29</td>
</tr>
<tr>
<td>Finnish (FIN)</td>
<td>20</td>
<td>20</td>
</tr>
<tr>
<td>French (FRA)</td>
<td>18</td>
<td>18</td>
</tr>
<tr>
<td>German (DEU)</td>
<td>18</td>
<td>18</td>
</tr>
<tr>
<td>Hungarian (HUN)</td>
<td>40</td>
<td>18</td>
</tr>
<tr>
<td>Italian (ITA)</td>
<td>17</td>
<td>17</td>
</tr>
<tr>

<td>40</td>
<td>17</td>
</tr>
<tr>
<td>Spanish (ESP)</td>
<td>24</td>
<td>24</td>
</tr>
<tr>
<td>Swedish (SVE)</td>
<td>17</td>
<td>17</td>
</tr>
<tr>
<td>Swiss-French (FRS)</td>
<td>17</td>
<td>17</td>
</tr>
<tr>
<td>Swiss-German (DES)</td>
<td>18</td>
<td>18</td>
</tr>
</tbody>
</table>

**Default**

depends on the language prefix you use.

**Range**

3–(maximum width)

**Tip**

If the value for \( w \) is too small to include the complete day of the week and the month, SAS abbreviates as necessary.

**Details**

The EURDFWDXw. format writes SAS date values in the form \( dd \) month-name \( yy \) or \( dd \) month-name yyyy:

- \( dd \) is an integer that represents the day of the month.
- month-name is the name of the month.
- yy or yyyy is a two-digit or four-digit integer that represents the year.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

**Note:** The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of
certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

Comparisons

The EURDFWKXw. format is the same as the EURDFWDXw. format except that EURDFWKX w. format adds the day-of-week in front of dd.

Example

The example table uses the input value 15342, which is the SAS date value that corresponds to January 2, 2002. The first PUT statement assumes that the DFLANG= system option is set to Dutch.

```sas
options dflang=dutch;

put date eurdfwdx29.;
put date nlddfwdx29.
put date itadfwdx17.
```

<table>
<thead>
<tr>
<th>Statements</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>put day eurdfwdx29.;</td>
<td>2 januari 2002</td>
</tr>
<tr>
<td>put day nlddfwdx29.;</td>
<td>2 januari 2002</td>
</tr>
<tr>
<td>put day itadfwdx17.;</td>
<td>02 Gennaio 1998</td>
</tr>
</tbody>
</table>

EURDFWKXw. Format

Writes international date values as the name of the day and date in the form day-of-week, dd month-name yy (or yyyy).

Category: Date and Time

Alignment: Right
Syntax

**EURDFWKX**\(w\).

Syntax Description

\(w\) specifies the width of the output field.

<td>3</td>
<td>26</td>
<td>26</td>
</tr>
</tbody>
</table>
### Details

The EURDFWKXw. format writes SAS date values in the form *day-of-week, dd month-name yy* (or *yyyy*):

- **day-of-week** is the name of day.
- **dd** is an integer that represents the day of the month.
- **month-name** is the name of the month.
- **yy** or **yyyy** is a two-digit or four-digit integer that represents the year.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the format, SAS ignores the DFLANG= option.

**Note:** The EUR-date formats require European character sets and encodings. Some formats do not work correctly using non-European encodings. When running in a DBCS environment, the default format width and max width are larger than in the single-byte system to allow formats to use a double-byte representation of certain characters. However, you must use a session encoding that supports the European characters set like UTF-8.

### Comparisons

The EURDFWKXw. format is the same as the EURDFWDXw. format except that EURDFWKXw. format adds day-of-week in front of *dd*.

### Example

The example table uses the input value 15344, which is the SAS date value that corresponds to January 4, 2002. The first PUT statement assumes that the DFLANG= system option is set to German.
The second PUT statement uses the German language prefix in the format to write the name of the month in German. The third PUT statement uses the Italian language prefix in the format to write the name of the month in Italian. Therefore, the value of the DFLANG= option is ignored.

```plaintext

**EURFRATS\textsubscript{w.d} Format**

Converts an amount from Austrian schillings to euros.

- **Category:** Currency Conversion
- **Alignment:** Right

**Syntax**

\[ \text{EURFRATS}\textsubscript{w.d} \]

**Syntax Description**

- **w**
  - specifies the width of the output field.
    - Default: 6

- **d**
  - specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURFRATS \( w.d \) format converts an amount from Austrian schillings to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRATS\( w.d \) format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Austrian schillings, SAS statements, and the conversion results in euros.

```sas
data _null_;  
  input amount;  
  put amount eurfrats5.;  
  put amount eurfrats9.2;  
  datalines;  
50  
5234.56  
52345  
;  
run;  
```

<table>

EURFRBEBFw.d Format

Converts an amount from Belgian francs to euros.

Category: Currency Conversion

Alignment: Right
Syntax

**EURFRBEFw.d**

Syntax Description

- **w**
  - Specifies the width of the output field.
  - Default: 6

- **d**
  - Specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRBEFw.d format converts an amount from Belgian francs to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRBEFw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in Belgian francs, SAS statements, and the conversion results in euros.

```sas
data _null_;  
  input amount;  
  put amount eurfrbef5.;  
  put amount eurfrbef9.2;  
  datalines;  
50 5234.56 52345 ; run;  
8    put amount eurfrbef5.;  
9    put amount eurfrbef9.2;  
10   datalines;  
    E1    E1,24  
    E130  E129,76  
    1.298 E1.297,60

</table>
```

---

Chapter 25 / Additional NLS Language Elements
EURFRCHFw.d Format

Converts an amount from Swiss francs to euros.

Category:  Currency Conversion
Alignment:  Right

Syntax

EURFRCHFw.d

Syntax Description

w
  specifies the width of the output field.
  Default  6

d
  specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRCHFw.d format converts an amount from Swiss francs to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRCHFw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Swiss francs, SAS statements, and the conversion results in euros.

<table>
<thead>
<tr>
<th>Amounts</th>
<th>Statements</th>
<th>Results</th>

**EURFRDEMw.d Format**

Converts an amount from Deutsche marks to euros.

**Category:** Currency Conversion

**Alignment:** Right

**Syntax**

`EURFRDEMw.d`

**Syntax Description**

- `w` specifies the width of the output field.
  - Default: 6

- `d` specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURFRDEMw.d format converts an amount from Deutsche marks to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRDEMw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Deutsche marks, SAS statements, and the conversion results in euros.

```sas
data _null_;  
  input amount;  
  put amount eurfrdem5.;  
  put amount eurfrdem9.2;  
  datalines;  
50  
1234.56  
12345  
;  
run;  
8       put amount eurfrdem5.;  
9       put amount eurfrdem9.2;  
10      datalines;  
    E26  
    E25,56  
    E631  
    E631,22  
    6.312  
    E6.311,90
```

EURFRDKKw.d Format

Converting an amount from Danish kroner to euros.
Syntax

EURFRDKKw.d

Syntax Description

w
 specifies the width of the output field.

Default 6

d
 specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRDKKw.d format converts an amount from Danish kroner to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRDKKw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Danish kroner, SAS statements, and the conversion results in euros.

data _null_;  
  input amount;
  put amount eurfrdkk5.;
  put amount eurfrdkk9.2;
  datalines;

EURFRESPw.d Format

Converts an amount from Spanish peseta to euros.

Category: Currency Conversion

Alignment: Right

Syntax

EURFRESPw.d

Syntax Description

w

specifies the width of the output field.

Default: 6

d

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRESPw.d format converts an amount from Spanish peseta to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRESPw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Spanish peseta, SAS statements, and the conversion results in euros.
data _null_;

EURFRGRDw.d Format

Converts an amount from Greek drachmas to euros.

Category: Currency Conversion
Alignment: Right

Syntax

EURFRGRDw.d
Syntax Description

*w*  
specifies the width of the output field.  
Default 6

*d*  
specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRGRDw.d format converts an amount from Greek drachmas to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRGRDw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Greek drachmas, SAS statements, and the conversion results in euros.

data _null_;  
  input amount;  
  put amount eurfrgrd5.;  
  put amount eurfrgrd9.2;

EURFRHUFw.d Format

Converts an amount from Hungarian forints to euros.

Category: Currency Conversion
Alignment: Right

Syntax

`EURFRHUFw.d`

Syntax Description

`w` specifies the width of the output field.

Default 6

`d` specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRHUFw.d format converts an amount from Hungarian forints to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRHUFw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Hungarian forints, SAS statements, and the conversion results in euros.

```
data _null_;

EURFRIEPw.d Format

Converts an amount from Irish pounds to euros.

Category: Currency Conversion
Alignment: Right

Syntax

EURFRIEPw.d

Syntax Description

w
   specifies the width of the output field.
   Default  6

d
   specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURFRIEP\(w.d\) format converts an amount from Irish pounds to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRIEP\(w.d\) format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Irish pounds, SAS statements, and the conversion results in euros.

```sas
data _null_;

**EURFRPTEw.d Format**

Converts an amount from Portuguese escudos to euros.

Category:      Currency Conversion
Alignment:    Right

**Syntax**

**EURFRPTEw.d**
Syntax Description

\( w \)

specifies the width of the output field.

Default 6

\( d \)

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRPTE\( w.d \) format converts an amount from Portuguese escudos to an amount in euros and produces a formatted euro value. The conversion rate is a fixed rate that is incorporated into the EURFRPTE\( w.d \) format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Portuguese escudos, SAS statements, and the conversion results in euros.

```
data _null_;  
  input amount;  
  put amount eurfrpte5.;  
  put amount eurfrpte9.2;  
  datalines;  
300  
30234.56  
302345  
;  
run;  
8       put amount eurfrpte5.;  
9       put amount eurfrpte9.2;  
10      datalines;  
    E1  
    E1,50  
E151  
    E150,81  
1.508  
    E1.508,09
```

EURFRROLw.d Format

Converting an amount from Romanian lei to euros.

**Category:** Currency Conversion

**Alignment:** Right

**Syntax**

```
EURFRROLw.d
```

**Syntax Description**

- `w` specifies the width of the output field.
  - **Default**: 6
- `d` specifies the number of digits to the right of the decimal point in the numeric value.

**Details**

The EURFRROLw.d format converts an amount from Romanian lei to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRROLw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

**Example**

The following table shows input values in Romanian lei, SAS statements, and the conversion results in euros.

```
data _null_;    	input amount;    	put amount eurfrpte5.;    	put amount eurfrpte9.2;    
datalines;    
50    
5234.56    
52345
```

EURFRRURw.d Format

Converts an amount from Russian rubles to euros.

Syntax

EURFRRURw.d

Syntax Description

w
 specifies the width of the output field.

Default  6

d
 specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRRURw.d format converts an amount from Russian rubles to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRRURw.d format and the EUROCURR
function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in Russian rubles, SAS statements, and the conversion results in euros.

data _null_;  
  input amount;  
  put amount eurfrrur5.;  
  put amount eurfrrur9.2.;

EURFRSEKw.d Format

Converts an amount from Swedish kronor to euros.

Category: Currency Conversion
Alignment: Right

Syntax

EURFRSEKw.d
Syntax Description

\( w \)

specifies the width of the output field.

Default 6

d

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRSEK\( w.d \) format converts an amount from Swedish kronor to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRSEK\( w.d \) format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in Swedish kronor, SAS statements, and the conversion results in euros.

data _null_;  
   input amount;  
   put amount eurfrsek5.;  
   put amount eurfrsek9.2;  
   datalines;  
50  
1234.56

EURFRSITw.d Format

Converts an amount from Slovenian tolars to euros.

Category: Currency Conversion

Syntax

\texttt{EURFRSITw.d}

Syntax Description

\texttt{w}

specifies the width of the output field.

Default \texttt{6}

\texttt{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURFRSITw.d format converts an amount from Slovenian tolars to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRSITw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

\textbf{Note:} Slovenia’s currency is the Euro. The information for EURFRSIT is provided for user’s historical data.

Example

The following table shows input values in Slovenian tolars, SAS statements, and the conversion results in euros.

```sas
data _null_;  
 input amount;  
 put amount eurfrsit5.;  
 put amount eurfrsit9.2;  
 datalines;  
 200  
 20234.56  
 202345  
;  
run;  
```

### EURFRTRLw.d Format

Converts an amount from Turkish liras to euros.

**Category:** Currency Conversion  
**Alignment:** Right

#### Syntax

```
EURFRTRLw.d
```

#### Syntax Description

- **w**  
  Specifies the width of the output field.  
  Default: 6

- **d**  
  Specifies the number of digits to the right of the decimal point in the numeric value.

#### Details

The EURFRTRLw.d format converts an amount from Turkish liras to an amount in euros and produces a formatted euro value. The conversion rate is a changeable rate that is incorporated into the EURFRTRLw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.
Example
The following table shows input values in Turkish liras, SAS statements, and the conversion results in euros.

```sas
data _null_;  
   input amount;  
   put amount eurfrtrl5.;  
   put amount eurfrtrl9.2;  
   datalines;  
400  
40234.56  
402345  
;  
run;  
   E1  
   E1,19  
   E119  
   E119,42  
   1.194  
   E1.194,21
```

**EURTOATSw.d Format**

Converts an amount from euros to Austrian schillings.

Category: Currency Conversion  
Alignment: Right

**Syntax**

```
EURTOATSw.d
```
Syntax Description

\texttt{w}

specifies the width of the output field.

Default \hspace{1cm} 6

\texttt{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The \texttt{EURTOATS\ w\ d} format converts an amount in euros to an amount in Austrian schillings. The conversion rate is a fixed rate that is incorporated into the \texttt{EURTOATS\ w\ d} format and the \texttt{EUROCURR} function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Austrian schillings.

```
data _null_;

Chapter 25 / Additional NLS Language Elements
EURTOBEFw.d Format

Converts an amount from euros to Belgian francs.

Category: Currency Conversion
Alignment: Right

Syntax

EURTOBEFw.d

Syntax Description

\[ w \]

specifies the width of the output field.

Default 6

\[ d \]

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOBEFw.d format converts an amount in euros to an amount in Belgian francs. The conversion rate is a fixed rate that is incorporated into the EURTOBEFw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Belgian francs.

```sas
data _null_;  
  input amount;  
  put amount eurtobef6.;  
  put amount eurtobef12.2;

EURTOCHFw.d Format

Converts an amount from euros to Swiss francs.

Category: Currency Conversion

Alignment: Right

Syntax

EURTOCHFw.d

Syntax Description

w

specifies the width of the output field.

Default: 6

d

specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURTOCHFw.d format converts an amount in euros to an amount in Swiss francs. The conversion rate is a changeable rate that is incorporated into the EURTOCHFw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Swiss francs.

```sas
data _null_;  
  input amount;  
  put amount eurtochf6.;  
  put amount eurtochf12.2;  
  datalines;  
1
1234.56  
12345  
;  
run;  
SAS log:
8  put amount eurtochf6.;

EURTOCZKw.d Format

Converts an amount from euros to Czech koruny.
Syntax

EURTOCZK\textit{w}.\textit{d}

Syntax Description

\textit{w}

specifies the width of the output field.

Default 6

\textit{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOCZK\textit{w}.\textit{d} format converts an amount in euros to an amount in Czech koruny. The conversion rate is a changeable rate that is incorporated into the EURTOCZK\textit{w}.\textit{d} format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Czech koruny.

```sas
data _null_;
  input amount;
  put amount eurtoczk6.;
  put amount eurtoczk12.2;
  datalines;
  1
  1234.56
  12345
; run;
```

SAS log:

```
104 put amount eurtoczk6.;
105 put amount eurtoczk12.2;
106 datalines;
  35
  34.86
43032
43032.19
430301
430301.02
```
## EURTODEMw.d Format

Converting an amount from euros to Deutsche marks.

<table>
<thead>
<tr>
<th>Category:</th>
<th>Currency Conversion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alignment:</td>
<td>Right</td>
</tr>
</tbody>
</table>

### Syntax

`EURTODEMw.d`  

### Syntax Description

- **w**  
  Specifies the width of the output field.  
  Default: 6

- **d**  
  Specifies the number of digits to the right of the decimal point in the numeric value.

### Details

The `EURTODEMw.d` format converts an amount in euros to an amount in Deutsche marks. The conversion rate is a fixed rate that is incorporated into the `EURTODEMw.d` format and the `EUROCURRENTRATE` function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

### Example

The following table shows input values in euros, SAS statements, and the conversion results in Deutsche marks:

**EURTODKKw.d Format**

Converts an amount from euros to Danish kroner.

**Category:** Currency Conversion

**Alignment:** Right

**Syntax**

EURTODKKw.d

**Syntax Description**

w

specifies the width of the output field.
Default 6

\( \text{d} \)

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTODKKw.d format converts an amount in euros to an amount in Danish kroner. The conversion rate is a changeable rate that is incorporated into the EURTODKKw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Danish kroner.

```sas
data _null_;   input amount;   put amount eurtodkk6.;   put amount eurtodkk12.2;   datalines;   1   1234.56   12345   ;   run;
SAS log:
62   put amount eurtodkk6.;
63   put amount eurtodkk12.2;
64   datalines;
   7   7.49   9247   9246.97   92465   92465.16
```

</tr>
</tbody>
</table>
EURTOESPMw.d Format

Converts an amount from euros to Spanish peseta.

Syntax

EURTOESPw.d

Syntax Description

w
  specifies the width of the output field.
  Default 6

d
  specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOESPw.d format converts an amount in euros to an amount in Spanish peseta. The conversion rate is a fixed rate that is incorporated into the EURTOESPw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Spanish peseta.

```sas
data _null_
  input amount;
  put amount eurtoesp8.;
  put amount eurtoesp12.2;
 datalines;
1
1234.56
12345
; run;
```

```sas
26      put amount eurtoesp8.;
27      put amount eurtoesp12.2;
28      datalines;
166
166.39
205414
```
EURTOFIMw.d Format

Converts an amount from euros to Finnish markkas.

Category: Currency Conversion
Alignment: Right

Syntax

EURTOFIMw.d

Syntax Description

w
   specifies the width of the output field.

   Default 6

d
   specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOFIMw.d format converts an amount in euros to an amount in Finnish markkas. The conversion rate is a fixed rate that is incorporated into the EURTOFIMw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.
Example

The following table shows input values in euros, SAS statements, and the conversion results in Finnish markkas.

```sas
data _null_;  
  input amount;  
  put amount eurtofim6.;  
  put amount eurtofim12.2;  
  datalines;  
1  
1234.56  
12345  
;  
run;  
8  
  put amount eurtofim6.;

**EURTOFRFw.d Format**

Converts an amount from euros to French francs.

**Category:** Currency Conversion  
**Alignment:** Right

**Syntax**

```sas
EURTOFRFw.d
```
Syntax Description

\texttt{w}

specifies the width of the output field.

Default: 6

\texttt{d}

specifies the number of digits to the right of the decimal point in the numeric value.

Details

The \texttt{EURTOFRFw.d} format converts an amount in euros to an amount in French francs. The conversion rate is a fixed rate that is incorporated into the \texttt{EURTOFRFw.d} format and the \texttt{EUROCURR} function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in French francs.

\begin{verbatim}
data _null_;  
  input amount;  
  put amount eurtofrf6.;  
  put amount eurtofrf12.2;  
  datalines;  
  1  
  1234.56  
  12345  
  ;  
  run;  
8       put amount eurtofrf6.;  
9       put amount eurtofrf12.2;  
10      datalines;  
  7  
  6.56  
  8098  
  8098.18  
  80978  
  80977.89
\end{verbatim}

\begin{tabular}{|c|c|c|}

\end{tabular}
### EURTOGBPw.d Format

Converts an amount from euros to British pounds.

**Category:** Currency Conversion  
**Alignment:** Right  

#### Syntax

\[
\text{EURTOGBPw.d}
\]

#### Syntax Description

- **w**  
  Specifies the width of the output field.  
  **Default:** 6

- **d**  
  Specifies the number of digits to the right of the decimal point in the numeric value.

#### Details

The EURTOGBPw.d format converts an amount in euros to an amount in British pounds. The conversion rate is a changeable rate that is incorporated into the EURTOGBPw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

#### Example

The following table shows input values in euros, SAS statements, and the conversion results in British pounds.

```sas
data _null_;  
  input amount;  
  put amount eurtogbp6.;  
  put amount eurtogbp12.2;

**EURTOGRDw.d Format**

Converts an amount from euros to Greek drachmas.

**Category:** Currency Conversion

**Alignment:** Right

**Syntax**

**EURTOGRDw.d**

**Syntax Description**

- `w` specifies the width of the output field.
  - Default: 6

- `d` specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURTOGRDw.d format converts an amount in euros to an amount in Greek drachmas. The conversion rate is a fixed rate that is incorporated into the EURTOGRDw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Greek drachmas.

```sas
data _null_;  
  input amount;  
  put amount eurtogrd8.;  
  put amount eurtogrd16.2;

EURTOHUFw.d Format

Converts an amount from euros to Hungarian forints.
Syntax

**EURTOHUF**\(w.d\)

**Syntax Description**

\(w\)
- specifies the width of the output field.
- Default: 6

\(d\)
- specifies the number of digits to the right of the decimal point in the numeric value.

**Details**

The EURTOHUF\(w.d\) format converts an amount in euros to an amount in Hungarian forints. The conversion rate is a changeable rate that is incorporated into the EURTOHUF\(w.d\) format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

**Example**

The following table shows input values in euros, SAS statements, and the conversion results in Hungarian forints.

```sas
data _null_
  input amount;
  put amount eurtohuf8.;
  put amount eurtohuf14.2;

## EURTOIEPw.d Format

Converts an amount from euros to Irish pounds.

**Syntax**

```plaintext
EURTOIEPw.d
```

**Syntax Description**

- **w**
  - specifies the width of the output field.
  - **Default**: 6

- **d**
  - specifies the number of digits to the right of the decimal point in the numeric value.
  - **Default**: 2

**Details**

The EURTOIEPw.d format converts an amount in euros to an amount in Irish pounds. The conversion rate is a fixed rate that is incorporated into the EURTOIEPw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

**Example**

The following table shows input values in euros, SAS statements, and the conversion results in Irish pounds.
data _null_;  
   input amount;  
   put amount eurtoiep6.;

**EURTOITLw.d Format**

Conveys an amount from euros to Italian lire.

**Category:** Currency Conversion  
**Alignment:** Right

**Syntax**

```text
EURTOITLw.d
```

**Syntax Description**

`w` specifies the width of the output field.
Default 6

d
specifies the number of digits to the right of the decimal point in the numeric value.

Details
The EURTOITLw.d format converts an amount in euros to an amount in Italian lire. The conversion rate is a fixed rate that is incorporated into the EURTOITLw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see “Currency Representation” on page 78.

Example
The following table shows input values in euros, SAS statements, and the conversion results in Italian lire.

```sas
data _null_;     input amount;    put amount eurtoitl8.;    put amount eurtoitl12.2;    datalines; 1 1234.56 12345 ; run; 44    put amount eurtoitl8.; 45    put amount eurtoitl12.2; 46    datalines; 1936 1936.27 2390441 2390441.49 23903253 23903253.15

EURTOROLw.d Format

Converts an amount from euros to Romanian lei.
Syntax

**EURTORO**\textsubscript{\textit{w}.\textit{d}}

Syntax Description

\textit{w}  
specifies the width of the output field.

Default 6

\textit{d}  
specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTORO\textsubscript{\textit{w}.\textit{d}} format converts an amount in euros to an amount in Romanian lei. The conversion rate is a changeable rate that is incorporated into the EURTORO\textsubscript{\textit{w}.\textit{d}} format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Romanian lei.

data _null_
  input amount;
  put amount eurtorol6.;
  put amount eurtorol12.2;

**EURTOSEKw.d Format**

Converts an amount from euros to Swedish kronor.

**Category:** Currency Conversion  
**Alignment:** Right

**Syntax**

```plaintext
EURTOSEKw.d
```

**Syntax Description**

```
w
```

specifies the width of the output field.
Default 6

d specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOSEKw.d format converts an amount in euros to an amount in Swedish kronor. The conversion rate is a changeable rate that is incorporated into the EURTOSEKw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Swedish kronor.

```
data _null_;  
  input amount;  
  put amount eurtosek6.;  
  put amount eurtosek12.2;  
  datalines;  
  1  
  1234.56  
  12345  
  ;  
run;  
SAS log:  
86      put amount eurtosek6.;  
87      put amount eurtosek12.2;  
88      datalines;  
  9  
  9.37  
11563  
11562.78  
115622  
115622.16
```

<table>
<thead>
<tr>

<td>put amount eurtosek12.2;</td>
<td>115622.16</td>
</tr>
</tbody>
</table>
EURTOSITw.d Format

Converts an amount from euros to Slovenian tolars.

Category: Currency Conversion
Alignment: Right

Syntax

EURTOSITw.d

Syntax Description

w
  specifies the width of the output field.
  Default 6

d
  specifies the number of digits to the right of the decimal point in the numeric value.

Details

The EURTOSITw.d format converts an amount in euros to an amount in Slovenian tolars. The conversion rate is a changeable rate that is incorporated into the EURTOSITw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Note: Slovenia’s currency is the Euro. The information for EURTOSIT is provided for user’s historical data.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Slovenian tolars.

data _null_;  
  input amount;  
  put amount eurtosit8.;  
  put amount eurtosit14.2;  
  datalines;  
1  
1234.56  
12345  
;  
run;  
SAS log:
152     put amount eurtosit8.;
153     put amount eurtosit14.2;
154     datalines;
         191
             191.00
    235801
         235800.96
    2357895
         2357895.00

<table>

<td>put amount eurtosit14.2;</td>
<td>2357895.00</td>
</tr>
</tbody>
</table>

**EURTOTRLw.d Format**

Converts an amount from euros to Turkish liras.

**Syntax**

`EURTOTRLw.d`

**Syntax Description**

`w`

specifies the width of the output field.

Default: 6

`d`

specifies the number of digits to the right of the decimal point in the numeric value.
Details

The EURTOTTOTRLw.d format converts an amount in euros to an amount in Turkish liras. The conversion rate is a changeable rate that is incorporated into the EURTOTTOTRLw.d format and the EUROCURR function. For more information about European currency conversion and currency conversion rate tables, see "Currency Representation" on page 78.

Example

The following table shows input values in euros, SAS statements, and the conversion results in Turkish liras.

data _null_;  
  input amount;  
  put amount eurtotrl8.;  
  put amount eurtotrl14.2;  
datalines;  
  1  
  1234.56  
  12345  
  ;  
run;

</tr>
</tbody>
</table>

EURDFDEw. Informat

Reads international date values.
Syntax

**EURDFDE**\text{w}.

**Required Argument**

\text{w} \\
\text{specifies the width of the input field.}

<table>
<thead>
<tr>
<th>Default</th>
<th>7 (except Finnish)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range</td>
<td>7–32 (except Finnish)</td>
</tr>
</tbody>
</table>

**Note** 
If you use the Finnish (FIN) language prefix, the \text{w} range is 10–32 and the default \text{w} is 10.

**Details**

The date values must be in the form \text{ddmmmyy} or \text{ddmmmyyyy}:

- \text{dd} is an integer from 01–31 that represents the day of the month.
- \text{mmm} is the first three letters of the month name.
- \text{yy} or \text{yyyy} is a two-digit or four-digit integer that represents the year.

You can place blanks and other special characters between day, month, and year values.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the informat, SAS ignores the DFLANG= system option.

**Example**

This INPUT statement uses the value of the DFLANG= system option to read the international date values in Spanish.

```sas
options dflang=spanish;
input day eurdfde10.;
```

This INPUT statement uses the Spanish language prefix in the informat to read the international date values in Spanish. The value of the DFLANG= option, therefore, is ignored.

```sas
input day espdfde10.;
options dflang=spanish;
data _null_;
input day eurdfd10.;
   put day;
datalines;
01abr1999
01-abr-99
;

<table>
<thead>
<tr>
<th>Values</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-------</td>
</tr>
<tr>
<td>01abr1999</td>
<td>14335</td>
</tr>
<tr>
<td>01-abr-99</td>
<td>14335</td>
</tr>
</tbody>
</table>

**EURDFD Tw. Informat**

Reads international datetime values in the form `ddmmmyy hh:mm:ss.ss` or `ddmmmyyyy hh:mm:ss.ss`.

Category:  Date and Time

**Syntax**

**EURDFDTw.**

**Syntax Description**

*w*  
specifies the width of the input field.

**Default**  18  
**Range**  13–40

**Details**

The date values must be in the form `ddmmmyy` or `ddmmmyyyy`, followed by a blank or special character, and then the time values as `hh:mm:ss.ss`. The syntax for the date is represented as follows:

**dd**  
is an integer from 01–31 that represents the day of the month.

**mmm**  
is the first three letters of the month name.

**yy or yyyy**  
is a two-digit or four-digit integer that represents the year.

The syntax for time is represented as follows:
**hh**

- is the number of hours ranging from 00–23,

**mm**

- is the number of minutes ranging from 00–59,

**ss.ss**

- is the number of seconds ranging from 00–59 with the fraction of a second following the decimal point.

The EURDFDTw. informat requires values for both the date and the time. However, the ss.ss portion is optional.

---

**Note:** SAS interprets a two-digit year as belonging to the 100-year span that is defined by the YEARCUTOFF= system option.

---

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See "DFLANG= System Option: UNIX, Windows, and z/OS" on page 689 for the list of language prefixes. When you specify the language prefix in the informat, SAS ignores the DFLANG= system option.

---

### Example

This INPUT statement uses the value of the DFLANG= system option to read the international datetime values in German.

```sas
options dflang=german;
input date eurdfdt20.;
```

This INPUT statement uses the German language prefix to read the international datetime values in German. The value of the DFLANG= option, therefore, is ignored.

```sas
input date deudfdt20.;
options dflang=german;
data _null_;
input date eurdfdt20.;
put date;
datalines;
23dez99:10:03:17.2
23dez1999:10:03:17.2
;```

<table>
<thead>
<tr>
<th>Values</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>23dez99:10:03:17.2</td>
<td>1261562597.2</td>
</tr>
<tr>
<td>23dez1999:10:03:17.2</td>
<td>1261562597.2</td>
</tr>
</tbody>
</table>
EURDFMYw. Informat
Reads month and year date values in the form \textit{mmmyy} or \textit{mmmyyyy}.

Category: Date and Time

Syntax
\texttt{EURDFMYw.}

Syntax Description
\begin{itemize}
  \item \texttt{w}
    \begin{itemize}
      \item specifies the width of the input field.
      \item Default: 5 (except Finnish)
      \item Range: 5–32 (except Finnish)
      \item Note: If you use the Finnish (FIN) language prefix, the \texttt{w} range is 7–32 and the default value for \texttt{w} is 7.
    \end{itemize}
\end{itemize}

Details
The date values must be in the form \textit{mmmyy} or \textit{mmmyyyy}:

\begin{itemize}
  \item \textit{mmm}
    \begin{itemize}
      \item is the first three letters of the month name.
    \end{itemize}
  \item \textit{yy} or \textit{yyyy}
    \begin{itemize}
      \item is a two-digit or four-digit integer that represents the year.
    \end{itemize}
\end{itemize}

You can place blanks and other special characters between day, month, and year values. A value that is read with EURDFMYw. results in a SAS date value that corresponds to the first day of the specified month.

\textbf{Note:} SAS interprets a two-digit year as belonging to the 100-year span that is defined by the \texttt{YEARCUTOFF=} system option.

You can set the language for the SAS session with the DFLANG= system option. (Because the SAS Installation Representative usually sets a default language for the site, you might be able to skip this step.) If you work with dates in multiple languages, you can replace the EUR prefix with a language prefix. See “DFLANG= System Option: UNIX, Windows, and z/OS” on page 689 for the list of language prefixes. When you specify the language prefix in the informat, SAS ignores the DFLANG= option.

Example
This INPUT statement uses the value of DFLANG= system option to read the international date values in French.
The second INPUT statement uses the French language prefix, and DFLANG is not specified.

```
options dflang=french;
input month eurdfmy7.;
```

```
input month fradfmy7.;
options dflang=french;
data _null_;  
   input month eurdfmy7.;  
   put month;
   datalines;
   avr1999
   avr 99
   ;  
   options dflang=english;
data _null_;  
   input month fradfmy7.;  
   put month;
   datalines;
   avr1999
   avr 99
   ;
```

<table>
<thead>
<tr>

<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>avr1999</td>
<td>14335</td>
</tr>
<tr>
<td>avr 99</td>
<td>14335</td>
</tr>
</tbody>
</table>

**EUROCURR Function**

Converts one European currency to another.

Category: Currency Conversion

**Syntax**

```
EUROCURR(from-currency-amount, from-currency-code, to-currency-code)
```

**Required Arguments**

- `from-currency-amount`
  - is a numeric value that specifies the amount to convert.

- `from-currency-code`
  - specifies a three-character currency code that identifies the currency that you are converting from. (See European Currency and Currency Codes on page 938.)
Tip If `from-currency-code` has a blank value, EUROCURR converts currency values from euros to the currency of the European country that you specify.

See “Example 4: Converting Currency When One Variable Is Blank” on page 940

to-currency-code
specifies a three-character currency code that identifies the currency that you are converting to. (See European Currency and Currency Codes on page 938.)

Tip If `to-currency-code` has a blank value, EUROCURR converts values from the currency of the European country that you specify to euros.

Details
The following table lists European currencies and the associated currency codes. Use the currency codes to identify the type of currency that you are converting to or converting from. Several countries use the Euro as their currency instead of the currency listed in the following table. This information is provided in order to satisfy user's historical data.

<table>

</tbody>
</table>
The EUROCURR function converts a specific country's currency to an equivalent amount in another country's currency. It can also convert a specific country's currency to euros. EUROCURR uses the values in either the fixed currency conversion rate table or the changeable currency conversion rate table to convert currency.

If you are converting from one country's currency to euros, SAS divides by that country's rate from one of the conversion rate tables. See “Example 1: Converting from Deutsche Marks to Euros” on page 939. If you are converting from euros to a country's currency, SAS multiplies by that country's rate from one of the conversion rate tables. See “Example 2: Converting from Euros to Deutsche Marks” on page 940. If you are converting one country's currency to another country's currency, SAS first converts the currency to euros. SAS stores the intermediate value in as much precision as your operating environment allows, and does not round the value. SAS then converts the amount in euros to an amount in the currency that you are converting to. See “Example 3: Converting from French Francs to Deutsche Marks” on page 940.

Examples:

Example 1: Converting from Deutsche Marks to Euros

The following example converts one Deutsche mark to an equivalent amount of euros.

data _null_;  
amount=eurocurr(50,'dem','eur');
Example 2: Converting from Euros to Deutsche Marks
The following example converts one euro to an equivalent amount of Deutsche marks.
```
data _null_;   
  amount=eurocurr(25,'eur','dem');  
  put amount=;                    
run;                           
The value in the SAS log is: amount=48.89575.```

Example 3: Converting from French Francs to Deutsche Marks
The following example converts 50 French francs to an equivalent amount of Deutsche marks.
```
data _null_;   
  x=50;           
  amount=eurocurr(x,'frf','dem');  
  put amount=;                    
run;                           
The value in the SAS log is: amount=14.908218069.```

Example 4: Converting Currency When One Variable Is Blank
The following example converts 50 euros to Deutsche marks.
```
data _null_;   
  x=50;           
  amount=eurocurr(x,' ','dem');  
  put amount=;                    
run;                           
The value in the SAS log is: amount=97.7915.```

## Encoding Methods and Character Sets

This table shows languages (locales) that support the same set of characters. For example, the Arabic locale in the first column has five compatible character sets: \text{WARABIC}, \text{ARABIC}, \text{MSDOS720}, \text{PCOEM864}, \text{OPEN}_{-}425. Encoding names used by SAS for the character sets are listed in the fourth column.

%COPY_TO_NEW_ENCODING Macro

Dictionary

%COPY_TO_NEW_ENCODING Macro Function

Creates a new version of a data set with a specified encoding.

Category: Encoding

Syntax

%COPY_TO_NEW_ENCODING(from_dsname, to_dsname, new_encoding)

Arguments

from_dsname
specifies the original data set name.

to_dsname
specifies the new data set name.

new_encoding
specifies the encoding of the new data set.

Details

Basics
The %COPY_TO_NEW_ENCODING macro creates a new version of a data set with a specified encoding. If the data set contains character variables whose values need larger lengths when transcoded to the specified encoding, then the DATA step creates a data set with the proper lengths. If the %COPY_TO_NEW_ENCODING macro is not used, the copy might fail because truncation of non-blanks is not
allowed. For example, the following code, with a euc-cn encoding, fails because the variable x needs three bytes to hold the transcoded UTF-8 representation:

```plaintext
data temp;
x='d6d0'x;
run;
data temp(encoding=utf8);
set temp;
run;
```

The `%COPY_TO_NEW_ENCODING` macro produces this type of code:

```plaintext
data temp(encoding=utf8);
length x $3;
set temp;
run;
```

**%COPY_TO_NEW_ENCODING** Macro Code

Here is the code for the `%COPY_TO_NEW_ENCODING` macro:

```plaintext
%macro copy_to_new_encoding(from_dsname,to_dsname,new_encoding);
%global orig_encoding;

%let prefix=goobly;

filename lngtstmt temp;
data _null_;
   file lngtstmt;
   put ' ';
runc;

filename kcvtused temp;
data _null_;
   file kcvtused;
   put ' ';
runc;

data temp2;
x=1;
runc;

%global sql_libname sql_memname;
data _null_;
   length libname memname $256;
   memname=scan("&from_dsname",-1,'. ');
   libname=ifc(index("&from_dsname","."),scan("&from_dsname",1,'."'),"WORK");
   call symputx('sql_libname',upcase(libname));
   call symputx('sql_memname',upcase(memname));
runc;
proc sql;
   create table temp as select * from dictionary.tables
      where libname="&sql_libname." and memname="&sql_memname.";
   quit;
data _null_;
   set temp;
   call symputx('orig_encoding',scan(encoding,1,' '));
runc;
```
FIGURE 1: A macro function for converting variable names and lengths from one encoding to another.
992 Chapter 26 / %COPY_TO_NEW_ENCODING Macro
run;
data temp; merge temp temp2(in=revised);
by name;
if revised then length=&prefix._length;
need_kcvt = revised;
run;
proc sort;
by npos;
run;
data _null_;
set temp;
file lngtstmt mod;
length nlit $512 stmt $1024;
nlit = nliteral(name);
len = cats(ifc(type=2,'$',' '),length);
stmt = catx(' ','length',nlit,len,';');
put stmt;
if need_kcvt;
stmt = trim(nlit)||' = kcvt('||trim(nlit)||",""&orig_encoding
."",""&new_encoding."");";
put stmt;
run;
%end;
%end;
data &to_dsname(encoding=&new_encoding);
%include lngtstmt/source2;
set &from_dsname(encoding=binary);
%include kcvtused/source2;
run;
filename lngtstmt clear;
filename kcvtused clear;
proc delete data=temp temp2;
run;
%mend copy_to_new_encoding;

%COPY_TO_NEW_ENCODING Macro with Explanations
Here is the code for the %COPY_TO_NEW_ENCODING macro with explanations:
Statements

Details

%macro copy_to_new_encoding(from_dsname,to_dsname,new_encoding);

Invoke the
%COPY_TO_NEW_ENCODING
macro.

%global orig_encoding;
%let prefix=goobly;

Use a prefix to ensure unique
variable names.

            &prefix._length = &prefix._charlens{_i_};
            output temp2;
        end;
    end;
run;

%if &revise %then %do;

%if &revise %then %do;

proc sort data=temp2; by name; run;
data temp; merge temp temp2(in=revised); by name;
    if revised then length=&prefix._length;
    need_kcvt = revised;
run;

proc sort; by npos;
run;

```

### Details

- **Revision is necessary only if there are character variables.**
- **Get the lengths of the negative character variables.**
- **Transcode all values and determine whether the lengths increase.**
- **Output varnames and revised lengths.**
- **If any lengths are revised, then create a LENGTH statement.**
- **Merge the revised lengths.**
- **Sort backward to npos to maintain the original order.**
