About This Book

**Audience**

This book is designed for administrators of the SAS Contextual Analysis application. It guides administrators through the process of configuring the software for use at your site. It is assumed that you have some familiarity with SAS programs and installation processes.

**Requirements**

For a full list of software requirements for SAS Contextual Analysis, go to [System Requirements](#).
For information about the accessibility of this product, see Accessibility Features of SAS Contextual Analysis 15.1 at support.sas.com.
Chapter 1

Maintenance Release Considerations

Determining Your Update Path for SAS Contextual Analysis

Upgrading an Existing SAS 9.4 Deployment

Migrating to SAS 9.4

About SAS Contextual Analysis

Support for SAS Contextual Analysis

SAS Contextual Analysis 15.1 Is Not Available in SAS 9.4M7

Steps for SAS 9.4.M7 Upgrades

Determining Your Update Path for SAS Contextual Analysis

Upgrading an Existing SAS 9.4 Deployment

Note: For information about SAS 9.4M7, see “SAS Contextual Analysis 15.1 Is Not Available in SAS 9.4M7” on page 3.

About SAS Contextual Analysis

SAS Contextual Analysis is a web-based categorization application that combines aspects of the power of SAS Text Miner and components of SAS Enterprise Content Categorization into a single user interface. Using SAS Contextual Analysis, you can build classification models that can automatically categorize a set of input documents. You can modify the text model to meet your needs.

SAS Contextual Analysis enables you to identify key textual topics in your document collections, automatically generate Boolean linguistic rules, and refine the model and use it to categorize documents. You can also take advantage of concept extraction capabilities by writing your own rules. (A concept is a property such as a book title, last name, city, gender, and so on.)

SAS has shipped these releases:

- SAS Contextual Analysis 12.3 in October 2013
- SAS Contextual Analysis 13.2 in August 2014
- SAS Contextual Analysis 14.1 in July 2015
- SAS Contextual Analysis 14.1M1 in November 2015
- SAS Contextual Analysis 14.2 in November 2016
- SAS Contextual Analysis 14.3 in September 2017
- SAS Contextual Analysis 15.1 in November 2018
For more information about these releases, contact your SAS account representative and see the software product page for SAS Contextual Analysis.

Support for SAS Contextual Analysis

**SAS Contextual Analysis 15.1 Is Not Available in SAS 9.4M7**

Starting in SAS 9.4M7 (August 2020), SAS Contextual Analysis is not supported on SAS 9.4 maintenance releases that occur in 2020 onward. To use a more recent version of SAS 9.4 with other SAS products, consider migrating your data to SAS Visual Text Analytics in SAS Viya.

SAS Contextual Analysis uses Adobe Flash. Adobe announced that it intends to end support for Flash technology and will cease to update and distribute the Flash Player at the end of 2020. Any SAS Contextual Analysis releases prior to SAS 9.4M7 might not work as expected starting January 1, 2021. For more information about Adobe Flash end-of-life, see SAS Software and Its Use of the Adobe Flash Player.

SAS Contextual Analysis 15.1 on SAS 9.4M6 is the last release of the product. If you order SAS 9.4M7, SAS Contextual Analysis will not be included in that order.

If you have an existing installation of SAS Contextual Analysis in your environment and plan to upgrade or migrate to SAS 9.4M7, instead consider SAS Visual Text Analytics in SAS Viya for your text analytics needs.

**Steps for SAS 9.4.M7 Upgrades**

If you have SAS Contextual Analysis in your order and you plan to upgrade to SAS 9.4M7, uninstall SAS Contextual Analysis and remove it from the configuration before upgrading or migrating to SAS 9.4M7.

- For information about how to uninstall SAS Software using the Graphical User Interface Tool, see SAS Deployment Wizard and SAS Deployment Manager 9.4: User’s Guide.

- To uninstall the components of SAS Contextual Analysis, see your Order Manifest which includes the product details (12–bytes) for the uninstall process.

If SAS Contextual Analysis is not removed before you upgrade or migrate to SAS 9.4M7, review the steps for upgrade-in-place or migration.

Chapter 2

SAS Contextual Analysis
Administrator’s Guide

Overview

Overview of SAS Contextual Analysis

SAS Contextual Analysis is a web-based text analytics application that uses contextual analysis to provide a comprehensive solution to the challenge of identifying and categorizing key textual data. Using this application, you can build models (based on training documents) that automatically analyze and categorize a set of documents. You can then customize your models in order to realize the value of your text-based data. In addition, you can create rules to extract concepts, which are properties such as a book title, last name, city, gender, and so on.

The SAS Contextual Analysis architecture is designed for single-tier or three-tier deployment.

SAS Information Online

The following resources are available to you online:

• SAS Technical Support, available at support.sas.com

• Help within the SAS Contextual Analysis application
Chapter 3
Quick Start for Running SAS Contextual Analysis

Quick Start Overview

This chapter is designed to help you start your SAS Contextual Analysis installation quickly. It provides basic steps for completing these tasks:

- signing in to SAS Management Console and creating a SAS library
- registering a data set for use in SAS Contextual Analysis
- adding a user profile in SAS Management Console
- signing in to the SAS Contextual Analysis application

Note: Before you perform the quick start steps, complete the installation from the SAS Install Center (available at support.sas.com) and complete the configuration steps. For information about installation and configuration, see “Install and Configure SAS Contextual Analysis” on page 24.

Quick Start Steps

After you install and configure SAS Contextual Analysis, complete the following steps:

1. Open SAS Management Console. Connect to the metadata repository using these credentials:

   **Metadata server host name**: the host name that you entered during installation and configuration

   **User name**: the default user name (*sasadm@saspw*) or other established user name

   **Password**: the password that you specified during installation and configuration

   **Note**: In order to create a library and register tables, you need to use an operating system account to run a workspace server.
Note: If you are installing SAS Contextual Analysis on a UNIX host, you must use SAS Management Console on a Windows computer (that has SAS Management Console installed on it).

2. In the left pane under Environment Manager, navigate to the Data Library Manager plug-in and right-click Libraries. The New Library wizard appears.
3. Select SAS BASE Library, and click Next.

4. Enter a name for the library in the Name field (for example, *sca_data*), and click Next.

5. Select SASApp as the application server, and click Next.

6. In the New Library Wizard, enter a libref name in the Libref field.

   Click New to specify the path to the sample data sets. Sample data sets are provided in the \([SAS\_HOME]\SASFoundation\9.4\tmine\sample\) directory. In a Windows environment, the default location is \(C:\Program\Files\SASHome\SASFoundation\9.4\tmine\sample\). Select the directory from the dialog box.
Click Next, and then click Finish to create the data library.

7. Register the tables from the data library into metadata. With the library selected, right-click to access the menu and then select Register Tables.
8. Enter the Libref name, and then click Next.

9. In the Log On window, enter credentials for an administrator account on the application server.

10. Select the tables that you want to register. Click Next, and then click Finish to register the tables in metadata.
The tables are now accessible from within SAS Contextual Analysis.

11. In SAS Management Console, use the User Manager to create a user profile.

12. Click the Groups and Roles tab. Grant the user membership to the following group in order to enable project sharing within the application: SAS Contextual Analysis Users.
13. On the **Accounts** tab, click **New**. Enter the login for the user. If you leave the **Password** field blank, SAS uses the system’s password (the domain password) for the credential.

14. Start SAS Contextual Analysis by using the following URL, where *localhost* is the name of the machine where the application is installed: http://localhost/SASContextualAnalysis. The Sign In window appears.
15. Sign in using your user credentials. The SAS Contextual Analysis application appears.

Chapter 4
SAS Contextual Analysis Architecture

Overview of the SAS Contextual Analysis Architecture

The SAS Contextual Analysis architecture is designed for single-tier or three-tier deployment. Figure 4.1 depicts a three-tier deployment model, which includes a client tier, a middle tier, and a server and data tier.

Figure 4.1 SAS Contextual Analysis 15.1 Architecture
SAS Contextual Analysis Components

The SAS Web Infrastructure Platform (WIP) provides the primary middle-tier components for the SAS platform. It supports n-tier architectures that are built around HTTP-based technologies. The middle-tier components in the SAS WIP not only provide for common infrastructure but also support distributed deployments and configurations that support enterprise requirements.

SAS Contextual Analysis middle tier

is the web application that is responsible for serving the user interface to a client’s web browser. After a client’s browser has loaded the Adobe Flex user interface for SAS Contextual Analysis, Flex uses a REST API to communicate back to the SAS middle tier. The SAS Contextual Analysis middle tier also serves as the conduit through which a user’s requests are routed to the SAS Text Analytics API middle tier.

SAS Text Analytics API middle tier

is the web application that hosts the REST API that is used for communication between the Flex client and the SAS Text Analytics Service middle tier.

SAS Text Analytics Services middle-tier

is the home of the majority of the “brains” for SAS Contextual Analysis. The SAS Text Analytics Services middle tier often communicates with the Advanced Analytics Common Database Server to store objects that are related to a SAS Contextual Analysis project (concepts, categories, and so on). The SAS Text Analytics Services middle tier also communicates through the SAS Web Infrastructure Platform to SAS Workspace Servers to process user requests that require a SAS session.

SAS Workspace Server

enables client applications to submit SAS code to a SAS session by using an application programming interface (API). SAS Contextual Analysis generates the SAS code necessary to perform a project’s analytical tasks and submits it to a SAS Workspace Server. You can run as many instances of SAS Workspace Servers as are needed to support your workload.

SAS Metadata Server

controls access to a central repository of metadata that is shared by all of the SAS applications in the deployment. The SAS Metadata Server enables centralized control so that all users access consistent and accurate data. Administrators use SAS Management Console to administer the SAS Metadata Server, including SAS server configurations. SAS Contextual Analysis also uses the SAS Metadata Server to obtain metadata about SAS libraries, tables, and SAS Workspace Servers, and to authenticate users.

SAS Web Infrastructure Database Server

is a database server that is used by the SAS WIP as the default location for middle tier data. These data include alerts, comments, and workflows.

Advanced Analytics Common Database Server

is a PostgreSQL database that is used to store SAS Contextual Analysis project-related data such as projects, concepts, categories, and so on.
Chapter 5
Updating to SAS Contextual Analysis 15.1

Update Overview

There are two ways to update to SAS Contextual Analysis 15.1:

• Update SAS Contextual Analysis software on an existing deployment.

• Install SAS Contextual Analysis software on a target machine and migrate your settings and project data from an existing deployment.

Updating an Existing Deployment

To update SAS Contextual Analysis software on an existing deployment, you must use the SAS Deployment Wizard. There you can choose to upgrade your current SASHOME directory. For more information, see SAS Guide to Software Updates.

Updating on a Target Machine and Migrating Project Data

To install SAS Contextual Analysis software on a target machine, you must use the SAS Deployment Wizard. For more information, see SAS Guide to Software Updates.

To upgrade SAS Contextual Analysis on a target machine that is not the existing deployment, use the SAS Migration Utility. For more information, see SAS Intelligence Platform: Migration Guide. The section “Product-Specific SAS Migration Utility Properties” includes specific steps for SAS Contextual Analysis.

After the migration of the software is complete, you must copy the data that you used in your projects from the source machine to the target machine. The data you used in your
projects can be found in the folder that you registered to the data library during post-installation.

You must copy all the project folders from the source machine to the same location on the target machine. For example, if you have a project folder in `C:\Users\myuserid\Documents\My SAS Files\9.4` on the source machine, then you must store the project folder in the same location on the target machine.

*Note:* During project migration, category names might be appended with an underscore and a number (_n). SAS Contextual Analysis appends category names only when name duplications occur.
Chapter 6
Preparing Your Data for Use with SAS Contextual Analysis

Data Access Requirements

When you are accessing data in SAS Contextual Analysis, keep in mind that SAS Contextual Analysis must follow the rules of the user accounts on the SAS Workspace Server machine. For example, if you are a standard user, then you cannot access data that are stored in another user's personal folder. You also cannot access data that are stored in commonly restricted folders such as C:\Windows\system32.

Text and Category Variable Names

The names of text variables (columns that you are analyzing) and category variables must follow these standard SAS variable naming conventions:

- Names can be up to 32 characters in length.
- The first letter must begin with an English letter or an underscore. Subsequent characters can be English letters, numeric digits, or underscores.
- The name cannot contain blanks or any special characters (other than an underscore).

Note: Variables that do not follow these naming conventions could cause errors during processing.

For more information about naming conventions for SAS variables, see SAS Language Reference: Concepts.
Registering Data (Including Start, Stop, and Synonym Lists)

You must register any data that you are using for text analysis, including synonym lists, stop lists, and start lists. Follow the steps for registering data in the section “Quick Start Steps” on page 7.

- For more information about creating a data library, see the section “Establishing Connectivity to a Library of SAS Data Sets” in SAS Intelligence Platform: Data Administration Guide.

- For more information about registering tables in metadata, see the section “Registering and Verifying Tables” in SAS Intelligence Platform: Data Administration Guide.

**TIP**  You can organize your metadata so that you can easily find data. For example, you can create metadata folders within the Shared Data folder for data sets, synonym lists, start lists, and stop lists. Register the respective data sets to each library so that you can see the structure within the browse window. An example is shown in the following graphic.
Chapter 7
SAS Contextual Analysis
Installation and Configuration

Installation Overview

Here are the major steps for installing SAS Contextual Analysis:

1. Make any system preparations that are necessary.
2. Create a SAS Software Depot.
3. Run the SAS Deployment Wizard.
4. Select from the standard deployment plans to install and configure SAS Contextual Analysis.

Pre-Installation Tasks

Overview

Before you install SAS Contextual Analysis, make any preparations to your system that you deem necessary. You might need to increase the shared memory of your machine, and you must create a SAS Software Depot on your machine.

Shared Memory Requirement for UNIX Systems

In order to ensure enough shared memory for operating the application’s database on the SAS Advanced Analytics Common Data Server, it is recommended that you extend the size of your shared memory to 6 GB.
Refer to the documentation for your operating system and machine to determine the current shared memory settings. For example, on a 64-bit Linux machine, you can run the command `ipcs -l` on the command line and note the value in the results for **max total shared memory**.

To extend the shared memory to 6 GB, refer to the documentation for your operating system.

**Create a SAS Software Depot**

A SAS Software Depot is a file system that is used by the SAS Deployment Wizard, which is the tool used to install and initially configure SAS. The depot contains the SAS Deployment Wizard executable, one or more deployment plans, a SAS installation data file for each order, order data, and product data.

To create a SAS Software Depot, follow the instructions in “Creating a Software Depot” in *SAS Intelligence Platform: Installation and Configuration Guide*. During the creation of the depot, you identify on the target machine where you want to download the depot.

*Note:* You need to have access to your software order details in order for SAS Contextual Analysis to create a depot.

---

**Install and Configure SAS Contextual Analysis**

**Installation and Configuration Process**

To complete the installation and configuration process, you must have completed the steps to download the SAS Software Depot. For more information, see “Create a SAS Software Depot” on page 24.

**SAS Contextual Analysis Server Standard Deployment Plans**

Deployment plans are blueprints for installing and configuring your software. SAS Contextual Analysis provides you with two standard plans in the SAS Software Depot: a one-machine deployment and a three-machine deployment.

To access the standard plan that is delivered with your SAS Software Depot, open the plan file. Select **Select a standard deployment plan**. Select **Contextual Analysis, one machine** or **Contextual Analysis, three machine**, depending on your desired configuration. For more information about the SAS Deployment Wizard, see *SAS Deployment Wizard and SAS Deployment Manager: User’s Guide*.

*Note:* If you cannot access your SAS Software Depot for some reason, you can download deployment plans from the SAS Install Center, available at [http://support.sas.com/documentation/installcenter/index.html](http://support.sas.com/documentation/installcenter/index.html). In the navigation pane, select **Standard Plans**. Under **SAS 9.4**, select **9.4 Standard Deployment Plans**, and then select **SAS Contextual Analysis**. Download the appropriate plan.
In the SAS Deployment Wizard, a prompt for the location of **SAS Home** appears. A default value is provided, based on the operating system on which are deploying. For example, on a 64-bit Windows machine, the default location is `C:\Program Files \SASHome`. If you choose to enter different location, be sure to note the location for later use.

Enter a password for the database.
You must also supply your host name, port, and administrator name (and password) for the SAS Advanced Analytics Common Data Server.
Continue through the wizard as described in *SAS Deployment Wizard and SAS Deployment Manager: User’s Guide*.

**Note:** If your data are encoded in UTF-8, you must select the box that sets up the SAS server as a Unicode server. Setting up the server as a Unicode server ensures that your UTF-8 is processed properly. For more information about setting up a Unicode server, see “Locale and Encoding Considerations” in *SAS Intelligence Platform: Installation and Configuration Guide*. 
Chapter 8
Post-Installation Information

Configure SAS Contextual Analysis in SAS Management Console

To start SAS Management Console, you must log on to the metadata repository using a specific set of credentials. For more information, see Step 1 on page 7.

Define Additional SAS Contextual Analysis Users

You can define additional SAS Contextual Analysis users by creating user profiles in SAS Management Console. For more information, see Step 11 on page 12.

Establish a Lock-Down Path List

If you are using SAS on a server that is in a locked-down state, you must establish a path list that can be accessed. For more information about servers in a locked-down state, see “Locked-Down Servers” in SAS Intelligence Platform: Security Administration Guide.

Set Up Integrated Windows Authentication

SAS Contextual Analysis supports Integrated Windows authentication (IWA). IWA enables the system to verify credentials through the logged-in Windows accounts,
thereby eliminating the need for users to separately sign in to SAS Contextual Analysis. For information about setting up IWA, see “Support for Integrated Windows Authentication” in *SAS Intelligence Platform: Middle-Tier Administration Guide*.

---

**Naming Project Files in SAS Contextual Analysis**

SAS Contextual Analysis projects can be updated by different people, but projects are not meant to be shared concurrently. It is important that you understand the file system so that you can guide users appropriately.

When SAS Contextual Analysis projects are created, libraries are created in the Library Manager of SAS Management Console and are assigned the project name. Each project name is associated with the user who created it.

*Note:* Users are prevented from using a project name more than once. However, multiple users can create projects that have the same name. You must sign in as an unrestricted user to see duplicate project names in the Library Manager of SAS Management Console.

---

**Configure Secure Sockets Layer (SSL)**

Secure Sockets Layer (SSL) configuration enables clients to authenticate with the SAS middle tier by using a client certificate that is installed in their web browser. When this type of client certificate is used for authentication, you are not required to provide a user name and password to log on. For more information, see “Support for SSL with Client Certificate Authentication” in *SAS Intelligence Platform: Middle-Tier Administration Guide*. 
Chapter 9
Administrator Tasks and Troubleshooting

Troubleshooting Log Files

The location of the SAS log files for the SAS Contextual Analysis middle tier varies from system to system, depending on the system configuration. In general, SAS Contextual Analysis middle tier log files are located here: [configuration-directory]\Config\Lev1\Web\Logs\SASServer1_1

Log Information

You can adjust the amount of information that is sent as output to the SAS Contextual Analysis middle-tier log. To increase the information that is sent as output to the log, do the following:

1. In the file system, navigate to [configuration-directory]\Config\Lev1\Web\Common\LogConfig.
2. Open the TextAnalyticsServices-log4j.xml file in a text editor.
3. Locate this section of code:

   <category
   additivity="false"
   name="com.sas.ta">
   <priority value="WARN"/>
   <appender-ref ref="SAS_CONSOLE"/>
   <appender-ref ref="SAS_FILE"/>
   </category>

   <category
   additivity="false"
   name="com.sas.ta.service"
Change the value `WARN` to `INFO`.

4. Restart the web application server.

**TIP** When enhanced logging is used, the SAS code that is output can be copied and pasted into a SAS session on the server machine.

**Locating the Rules Files (LI and MCO)**

The LI files (used for concept rules) and MCO files (used for category rules) are located within the configuration folder of the project directory. For example, the location of the folder on a Windows machine is `C:\Users\[user ID]\Documents\My SAS Files\9.4\sca_project_1\config\`. The folder contains the concepts.li file and the categories.mco file for the `sca_project_1` project.

**Garbage Characters When Testing Uploaded Files**

If you use an uploaded text file to test concepts or categories, you might see garbage characters displayed in SAS Contextual Analysis. Garbage characters can occur when the encoding of the test file does not match the encoding on your workspace server.
